District Fairs.—The assumption by the state of the functions of the old agricultural society naturally implied to the legislature that the state should liberally pay for their discharge. The legislature of 1880 which organized the State Board also organized agricultural districts which should hold fairs and have governing boards appointed by the governor of the state and thus become authorized to spend public money. Thus each legislator when doing something for the state could have something to take home to his own district. It worked finely. In 1880 the legislature created eleven districts and laid down a plan for creating more. The number rose to 29 in 1888; to 45 in 1895, and in 1896 something dropped, for Governor Budd said in 1896:

The legislature failed to carry out

my suggestion as to agricultural societies and made appropriations therefor aggregating \$193,000, which I disapproved—thus saving that amount.

But the fairs of the fourth decade were notable and the collection of reports of all the district fairs made the transactions of this decade bulky and full of interesting local information. In 1884 the first fair was held in the new pavilion in the rear of the State Capitol—the building of which cost the state and the city of Sacramento \$40,000 each.

The fifth decade beginning with the loss of state aid in 1895 was characterized by serious effort and sacrifice on the part of a few people who maintained fairs and indulged lightly in publications because there was no money to pay for them. The incidents of the time are within easy memory and need not be rehearsed.

The sixth decade, which closed in 1914, is also easy of recollection, but it must be noted that it seemed to contain the beginning of a progressive era which promises the greatest achievement yet secured on the foundations laid by the pioneers. In accordance with legislation of 1895 the directors sold all real estate it owned, purchased a new site of 100 acres on the southeastern edge of Sacramento city and deeded it to the state. In 1907 the legislature appropriated \$50,000 for wrecking the pavilion of 1884 and beginning buildings on the new site. Since then many new buildings and other improvements have been secured and fairs of notable excellence have been held. Many new policies and methods in exhibition have been introduced and the fairs have been given an educational and actual operation, character in accordance with the progressive "show methods" of the day.

The State of California is generously building up its good institutions with a generosity and outlook which the pioneers could not command and the outfit and work of the State Board of Agriculture should always rank in that class. Though the pioneers could not do what they desired, no one ever doubted the quality of their foresight. It may be then that we are now just on the point of realizing what John Bidwell foresaw thirty-five years ago when he said:

This society needs to be placed upon a permanent foundation. Being a state institution it ought, to the extent of its needs and in proportion to its importance to have the fostering care of the state. But in order to permanence it needs more than money: its foundations must rest deep in the hearts and affections of the people. One hundred thousand dollars for a suitable hall and other requisites would be a cheap and profitable investment: not a hall like this, covering part of a block, but a grand temple of industry which with its ample stock grounds, its track for useful parades and exercises, its park and botanic gardens would become the most useful and attractive institution in all the state.

And we believe that if Bidwell, that grand old pioneer who loved California for her own sake, because he came nearly a decade before gold was found, could speak today he would say:

"Young man: I said a hundred thousand. That was a large sum for that day, but I meant a million!"

BULL EXERCISERS.*[Written for Pacific Rural Press.]*

On large dairies where several bulls must be kept for herd sires, and on breeding establishments where a large number of young sale bulls must be kept on hand, the problem of furnishing exercise for such animals is quite often a difficult one.

This has been entirely overcome at the Napa State Hospital by the erection of a merry-go-round device called by Manager Owen Duffey and herdsman V. L. Heath, a "bull exerciser."

This device can best be compared to a four-spoked wheel running on an axle set perpendicular in the

cream grading is amply demonstrated by the experience of the Danish Creamery at Fresno and the Visalia Co-operative Creamery at Visalia.

Manager Murphy of the former is authority for the statement that they have 1000 customers, the larger percentage of whom have small dairies in connection with other farming interests, and who would not therefore be ordinarily expected to produce such a good cream as larger dairies with better equipment.

The patrons are paid a premium over the San Francisco butter quotation but receive one cent less for cream testing under 30 per cent, and sour cream is not accepted at all.

The Two Napa Hospital Bulls Exercise Each Other in the Shade.

ground, the spokes in this case being made of heavy timbers.

Around the ends of these spokes and in circular form, has been erected a strong slatted fence about eight feet high, with a swinging gate at two places. A piece of lumber has been fastened on to the inside of this fencelike structure, about four feet from the ground, on which the ends of the spokes rest, these ends being equipped with small rollers to make pushing around easier.

The bulls are tied to the outside ends of these spokes with strong ropes and the pushing around by an ambitious bull turns the entire wheel and in this way forces the lazier bull to follow.

By the addition of a roof over the structure, which will be built this year, the bulls on this place can be exercised in the worst kind of weather with no loss of caretakers' time, also with entire safety.

WHAT CREAM GRADING IS DOING.*[Written for Pacific Rural Press.]*

While there has been a constant complaint on the part of creamery men in California, regarding the quality of cream being produced by the farmer, it has been this journal's contention at all times that the creamery manager in most instances is the man directly responsible for the condition because of his indisposition to pay more for good cream than for bad.

In the past year there has been more done to improve this condition than ever before; and while the farms who are taking a firm stand on the matter of cream grading are still too few in numbers, their influence is being felt by their more boldly-kneed competitors, also by the dairymen who have been producing good cream but getting no extra pay for their trouble. That the dairymen respond to

But Mr. Murphy does not believe in spoiling good cream after it comes into his possession either; and all of his cream wagons cover their routes and are at the creamery before noon, all wagons arriving after eight o'clock using canvas covers to protect the cans from the hot sun. To still further improve his butter Mr. Murphy pasteurizes all of his cream and as a result of this practice Danish Creamery butter enjoys a good reputation in all markets. Moreover it sells for the highest price.

At Visalia, Manager N. J. Peck is equally certain that grading is the only sure way of improving the quality of butter. This year he has shipped six cars of butter to Eastern markets and all of it has been profitably sold.

Grading here is even more stringent than at Fresno, two cents a pound less being paid for less than 30 per cent cream and no cream with high acidity being accepted.

In both communities mentioned the dairymen do not find it difficult to comply with the grading system if they install cream coolers, which most of them have purchased very cheaply.

Outside of the beneficial results in stabilizing the butter markets of the State, cream grading is bound to meet with the approval of every good dairyman; for it is the only method by which he can expect to be paid for producing a good clean cream, as most everybody who takes pride in his work prefers to produce.

Supposing that the U. S. Census Bureau estimate of the number of farms and horses in the country is correct, at the rate of increase in the production of farm tractors in 1915 over that of 1914, it would require more than twenty-five years to replace 30 per cent of the farm horses. This looks like good business for everybody, says the Mo. Fruit Grower.

LIVESTOCK DIRECTORY.

SWINE.

BIG TYPE POLAND CHINA HOGS—Bred sows, bred gilts, open gilts, weanlings, both sexes, boars ready for service. Herd sires, Iowa Wonder and Joker. Iowa Wonder is a son of "A Wonder," the greatest Poland-China boar living or dead. Joker was the First Prize boar in the Under Six Months Class at the Wisconsin State Fair in 1915. All animals are registered free of charge. Prices low on account of being overstocked. All animals first class. Quick, easy feeders, the kind the farmer wants. As a special premium each purchaser will be given a year's subscription to the "American Swineherd," the special advocate of the Poland-China, and a copy of "The Handbook on the Sow" and "The Pig Feeder's Manual." Write Geo. A. Smith, Corcoran, Cal.

BILIKEN HERD OF IMPROVED CHESTER WHITES—The Farmer's Utility breed. Quiet disposition, big, uniform litters, easy feeders, rapid growers, size combined with quality. 15 bred gilts and 60 spring pigs, of both sexes, to offer. Prices are reasonable and quality is high class. The best and most popular blood lines of the breed are represented in this herd. Every one immunized by the virus-serum treatment. Write for circular and prices, C. B. Cunningham, Mills, Sacramento County, Cal.

REGISTERED DUROC-JERSEYS—60 head priced to sell before October 1st. Bred sows and gilts, open gilts, boars, and spring pigs, representing the most noted families of the breed. Only choicest individuals, shipped for breeding purposes, at prices within reach of every one; absolutely guaranteed and in first-class condition. For particulars write to Haden Smith, Route 1, Box 84D, Woodland.

YOUNG POLAND CHINAS, LARGE TYPE—Boar IBA Wonder won first and Reserve Championship P. I. E., weighing 730 pounds under 2 years and in breeding condition. 60-day special—fine young sows bred to IBA Wonder at very low prices; also weanling pigs, either sex. Satisfaction, or money refunded. W. A. Young, Lodi, Cal.

BERKSHIRE BOAR—Son of Star Value, Values Bachelor 137,554, Dam Lady Bachelor 5th. Six years old, weighs 700 lbs. in light breeding condition. Active. Excellent sire, \$65. Registered pigs sired by above and Wilts Masterpiece 210,102, \$15. Trios, \$40. W. H. Waugh, Riverside, Cal.

POULTRY AT THE STATE FAIR.

[Written for Pacific Rural Press]

The poultry industry had a large cement-floored, well-lighted hall, for the State Fair of 1914, but the long list of entries behooved the management to get busy pronto to provide shelter for the exceedingly larger number. Therefore, an addition to the older building is just being completed, to double the capacity. It is built around a square court, one side of which consists of the old building. It has cement floors, and along the full length of one side is a concrete tank, three feet deep to accommodate waterfowl. Good lighting and ventilation are provided. A new space has been laid out for game birds.

The California Poultry Association will meet during the fair. A larger number of the exhibitors won prizes at the Panama-Pacific, and the poultryman who wants to see a great aggregation of really good fowls will see them here.

Besides all the common breeds, there will be some white cochin and black cochin by J. W. Blackman of Los Angeles. These big birds of the lustrous feathers are of a nearly extinct breed and will be worth looking for. Y. Miki of Sacramento will show some rare Japanese fowls of long tails and weird heads. Harry Robbins of Los Angeles, has entered Partridge cochin; and Percy Ward & Sons of Oakland entered Japanese Silkies, and the rare Maline fowls. Notice the uncommon fowls in the following list of entries, which is practically complete:

Poultry appliances will be shown by Rogers Mfg. Co., San Francisco, F. Smith Co., Sacramento and Perry Flour Co., Stockton.

Rhode Island Reds.—Baywood Poultry Farms, San Mateo; B. L. Lissel, Modesto; Fowler and Masteron, Duarte; B. C. Quessenberry, Lodi; Mrs. J. F. Rose, Ceres; Mrs. Will Taylor, Sacramento; Harold Wattew, Los Angeles, (Rose comb); and F. S. Thornton, Escalon.

Barred Plymouth Rocks.—W. D. Thomas, Sacramento; Hale Prather, Ukiah; A. D. Robinson, Point Loma; J. M. Smith, Napa; Golden Rule Poultry Farm, St. Helena; C. L. McGee, So. Berkeley; Cameron Bros., Sacramento; F. A. Drew, Oakland; Sunny Hill Poultry Yard, Ripon.

White Plymouth Rocks.—Mrs. D. Doyle, Pasadena; Mahajo Farm, Sacramento.

Leghorns.—Henry Robbins, Los Angeles, (Partridge); Rose Lawn Farm, Van Nuys, (White); Emerson and Mumford, Burbank, (White); J. L. Bartholomew, Chino, (Buff); Emanuel Roberts, Concord, (Buff); Mahajo Farm, Sacramento (White.) Minorcas.—B. F. Hurst, Los Angeles (Buff); H. D. G. McCartney, Los Angeles, (Black); W. P. Williams, Los Angeles (Buff.)

Anconas.—Cora J. Bamford, Garbana; Harry Raines, Fair Oaks; A. Taggart, Oakland.

Orpingtons.—Percy Ward & Sons, Oakland, (Buff); Mrs. R. S. Paulding, Woodland, (Black); F. Lacy, Threlkeld, Porterville, (White); H. M. Hansen, Sacramento, (Buff); Mrs. Jennie Helbing, Los Angeles (Black); W. M. McGee, Oak Park (Buff); Mrs. Jennie Perry, Los Angeles (White); J. J. Graves, Redwood, (Buff.)

Wyandottes.—G. H. Buhrman, Watsonville, (White); W. A. French, Stockton, (Silver); J. J. Garvey, Corbin, (White); C. L. McGee, So.

Berkeley, (Silver Laced).

Langshans.—George Lohr, San Francisco, (Black, White); C. L. McGee, So. Berkeley, (Black); J. R. Crabtree, Oakland, (Black.)

Bantams.—R. G. Baxter & Son Whittier; W. A. French, Stockton; Fowler Masterson, Duarte; J. W. Blackman, Los Angeles; A. J. Dixon, Fresno; D. D. Davenport, Stockton; Mrs. Jennie Helbing, Ross; Hinds & Spicer, Oakland; Margery Perry, Ross.

Rarer Breeds.—G. H. Pettingill, Lockeford, Blue Andalusians; Manuel Roberts, Concord, Silver Campines; J. T. Skelton, Sacramento, Silver Campines, Red Sussex; Percy Ward & Sons, Oakland, Silkies, Dark Cornish, and Maline; Mrs. V. K. Hamilton, San Gabriel, Blue Andalusians; Mrs. Jennie Helbing, Ross, Light Brahmas; C. L. McGee, Houdans; W. M. McGee, Oak Park, Dark Cornish; Y. Miki, Sacramento, Japanese Game, Sakura, and Anagi; Mrs. D. D. Davenport, Stockton, White Japanese Silkies; J. W. Blackman, Los Angeles, White Cochins, Black Cochins; Mrs. S. G. Bramhall, Oakland, Light Brahmas.

Rabbits and Hares.—G. H. Pettingill, Lockeford, Flemish; Walter Hickling, Fruitvale, New Zealand; Berry Bros., Auburn, New Zealand; H. Eldridge, Burlingame, Flemish and Rufus Red Belgian; U. Gidoux, San Mateo, New Zealand, Red and French Silver.

Geese.—Mrs. J. G. Mee, Saint Helena, Embdens; The Ferris Ranch, Pomona, Africans; W. A. French, Stockton, Toulouse.

Ducks.—B. C. Quessenberry, Lodi, Pekins; Mrs. Jennie Helbing, Ross, Rouens; E. M. LaBaron, Mesa Arizona, Rouen; G. G. and J. K. McChesney, San Jose, Colored Muscovy; W. M. McGee, Oak Park, Fawn and White Indian Runners; The Ferris Ranch, Pomona, Buff ducks; W. A. French, Stockton, Rouens, Pekins, White Muscovy, Colored Muscovy.

Turkeys.—N. E. Mulick, Willows, Mammoth Bronze; Mrs. J. G. Mee, St. Helena, Mammoth Bronze; J. W. Blackman, Los Angeles, Mammoth Bronze; The Ferris Ranch, Pomona Bourbon Red.

POULTRY NOTES.

Many new poultry plants are being established in the districts around Modesto and Turlock.

Len White of Ogden, Utah, is buying horses through August, around Modesto, for the U. S. army.

Many new poultry plants are being established in the districts around Modesto and Turlock.

The Coalinga Poultry Ass'n recommended that its members report to C. T. Walker their exhibits for the Fresno Fair.

The Kings County Poultry Ass'n has decided to hold its annual exhibition at the fair grounds during the Kings County Fair.

Misses Florence and Ada Birks of West Sutter have recently added 800 turkeys to their flock of 400. The 800 were purchased from Fred Stopher of Dunnigan.

A loss of eggs amounting to \$2,500,000 in Missouri alone during warm weather is attributed by the College of Agriculture to storage at temperatures over 70 degrees and in musty places. They should be stored like butter.

A loss of eggs amounting to \$2,500,000 in Missouri alone during warm weather is attributed by the College of Agriculture to storage at temperatures over 70 degrees and in musty places. They should be stored like butter.

TRAPNESTING FOR EGGS.

[Written for Pacific Rural Press by Susan Swaysgood, Pomona.]

This is the time to be getting ready for winter eggs; for unless we prepare for them the harvest will be skimpy.

The question as to whether there is "an egg type" is answerable only by the man who gets the egg. To get the egg we must have hens that have been selected for two or three generations back, and the culls sent to market faithfully, no matter how good looking they were.

For people that are not good judges, there is nothing so sure as a few trap nests faithfully looked after. They take considerable time. But if you cannot get the drones without them, it is valuable time that will be paid for by saving in feed. We cannot afford to run a flock haphazard style. So if you can't tell the drones, lose no time in setting up a trap nest or two and getting down to business. You can feed a small flock much cheaper than a large one, and by concentrating the feed and care on those that are good layers you will get more winter eggs than is possible by trying to carry over a lot of deadheads.

After securing the trap nests, put a band that is numbered on each hen, being careful that no two hens are banded with the same number, then write out a sheet of such hens that are to lay in that nest and give the numbers of each hen; as a hen is released from the trap, look at her number and credit her egg on the sheet.

Then set the nest ready for the next hen and take the last egg out of the nest. When a person is out among the flock it is very little trouble to watch several trap nests; but if there is other work, the hens get neglected and are often kept in the nests so long that it interferes with the supply of eggs. So if these nests are put in it pays to devote the time to watch and liberate the hens promptly as soon as they have laid.

Properly speaking the trap nest is a fixture for the breeding pen. If the breeding pen has been attended right we will have hens that lay over 150 eggs in the year. Hens which lay less, unless they are good setters and mothers, thus making

up in another way, are kept at a loss, and should not be carried over for winter egg production.

Breeding From Crosses.—I have some Black Minorcas and in the lot is a top-knot, very black. I set her eggs and now have a pen of them with a rooster of same. Will it be all right to mate these hens with the rooster?—J. L. R.

They are most likely Houdans. Did you ever look how many toes they have? Houdans have a top-knot and an extra toe growing out behind, but as a rule they are spotted like Anconas. It might do to mate them one year, but the progeny will most likely revert back to the Minorca type, if your male was a Minorca. If the hen was an extra good layer it would be worth trying out; if not, very little good will be secured by another generation of a cross.

Turkey Hen Wastes Away.—A year-old turkey hen began moping a week ago, she refused all kinds of feed, but drank water. After the fourth day I put her in a coop and forced bread and milk down her, but she seemed unable to swallow. This morning she was dead. All flesh had wasted away. Had thin brown droppings. Upon opening the gizzard, found it packed with gravel and brownish water. Hen had been running on barley stubble with a brood of young, had alfalfa run too. Young are all healthy. This morning another hen is moping the same way. Have never had any trouble before. —Mrs. B. C. Modesto.

I think this turkey has been wasting away some time and you have not noticed her; the trouble is consumption. You probably neglected to see that she was properly fed while sitting, then she came off with a brood; and mother-like let them have all she found on range until she got so that she had just as soon go without as to eat. See to it that your flock get enough to maintain the bodily need; you can find out by feeling the crops of the mother hens at night.

CORN

Harvester cuts and throws in pile on harvester or windrows. Man and horse cuts and shocks equal to a Corn Binder. Sold in every state. Price only \$22.00 with fodder binder. Testimonials and catalog FREE showing picture of Harvester. PROCESS MFG. CO., Dept. 2472, Salina, Kansas.

Keep Those Nests Clean

Mites, scaly leg and germs of roup, canker, white diarrhea and other diseases lurk unseen and unsuspected in the straw or shavings. Neglect may be the cause of infection wiping out your flock. Prevent the entrance and spread of disease by sprinkling the nests with

CARBOLA
The Disinfecting White Paint

Guaranteed harmless to the birds yet is 20 times stronger than carbolic acid in the destruction of germs. Comes in powder form. As a paint for the walls, ceilings and floors of poultry houses, cellars, dairies, barns and other places it is unequalled. Just mix with water and put on with brush or sprayer. Will paint any surface a beautiful snow-white and disinfect the premises at one operation. Will not taint food products of any kind.

Use It Instead of Whitewash

Will never flake, peel or blister. Adheres to wood, stone, brick or cement. Get it from your dealer. If he will not supply you send his name and your order to us.

10 lbs. (10 gals.) for \$1 and postage. 20 lbs. (20 gals.) for \$2 delivered free. 50 lbs. (50 gals.) for \$4 delivered free.

A trial package, enough to paint and disinfect 250 square feet, from your dealer or sent by parcel post for 25 cents.

MRS. BEST'S LETTER.

My dear Friends:

In my travels this summer, I visited one country home where there was quite a family of children and each and all of them had their own special duties to perform about the house. One of them had the entire charge of keeping the wood-box full and to a couple of the others was assigned the much-dreaded task of dishwashing.

But in this household, dishwashing had been robbed of half its disagreeableness by the thorough, systematic manner of doing it and that was due to the efficiency of the mother, who knew just how it should be done, taught her children how to do it and then saw to it that they did it that way.

In the first place, every dish was either scraped with a rubber scraper or wiped with a piece of brown paper, so that no grease was left on its surface.

When dishes are piled into the pan thick with grease and bits of food, it is no wonder that dishwashing becomes a horror.

With plenty of hot water, a good white soap in a shaker and a dish mop, the work goes along very rapidly and when the dishes are placed in the drainer, and well scalded, it barely takes any wiping at all to polish them. Some people do not wipe at all, but this mother believed in having the dishes polished.

She had them wash the glasses first, before any soap was added to the water, silverware next and then the china and really the dishwater was almost as clean after the last dish was taken out as when the first glass was put in.

She always had an abundance of hot water, so when the dinner was ready to serve, she emptied all the cooking utensils and slipped the food into the oven and those pots were all washed before dinner went onto the table. If you have never tried this, it is worth remembering, for these cooking dishes will wash in half the time when first emptied than after they have stood half an hour or more.

You would have been surprised and delighted to see how easily this task, which so often is a very disagreeable one, was accomplished and with what pride those youngsters worked. They are certainly going to be capable, efficient housekeepers and be able to make some man happy, thanks to their mother's careful training. Yours devotedly,

Rosabella Best.

FRICASSEED CHICKEN.

Cut in convenient pieces for serving, wash and dry, roll in flour and fry in lard or drippings until brown. Put into a kettle with a close cover, season to taste and nearly cover with boiling water. Keep where it will cook slowly for two or three hours, according to the age of the fowl. This is a good way to cook an old chicken as it insures tender meat and plenty of gravy, which when thickened and well seasoned adds to the generousness of the meal.

MARSHMALLOW CREAM.

Where ice is not available, the gelatine dishes are popular substitutes for ice-cream and sherbets. The following attractive dish will make a nice change for a company dinner:

1 tablespoon granulated gelatine, $\frac{1}{2}$ cup cold water, $\frac{1}{2}$ cup boiling water, whites of 4 eggs, 1 cup sugar, 1 teaspoon vanilla, 1 teaspoon lemon extract, $1\frac{1}{2}$ squares chocolate.

Soak gelatine in cold water five minutes. Add boiling water, and place over hot water until dissolved. Cool but do not chill. Add sugar gradually, beating continually. Divide quickly into three parts. To the first, add a little pink coloring paste and the vanilla; to the second add melted chocolate and vanilla, and flavor the third with lemon. Have ready a wetted mold or bowl with straight sides. Put into it the chocolate mixture. When this is set, put in the white and then after that sets, the pink. Candied cherries may be added to the white and nuts to the pink. Serve with whipped cream.

TO COOK STRING-BEANS.

After your beans are snapped, wash thoroughly and drain. Heat a generous amount of drippings or bacon fat in a skillet and brown your beans thoroughly. Then add water and cook as usual. The browning seems to give a richer flavor to the beans.

When the hands are dry and red, either from housework or the weather, bran water will be found very soothing. To obtain the water, put bran into a cotton bag, and boil for twenty minutes. When necessary to wash the hands during the day, use the bran water somewhat diluted. If used faithfully, this will keep the hands smooth and white.

WATERMELON SYRUP.

The U. S. Dept. of Agriculture is authority for the following recipe for a table syrup made of watermelons. This syrup can be used immediately or can be bottled hot and kept. About thirteen gallons of juice will make one gallon of syrup. This amount of juice can ordinarily be secured from ten melons of about twenty-five pounds' weight. The juice must be boiled down to the consistency of syrup.

DESTROYING COBWEBS.

Editor Home Circle: Having seen an inquiry in your paper about the pest of spider webs and no answer, will say the best way I have found is to burn them with a torch made by winding a piece of cloth around a small stick and wetting with kerosene. Or better still, use the torch like the painters use to burn off paint. Of course, to be permanently rid of them, the spiders must be destroyed.—U. S. A., Modesto.

The early order for fruit trees gets first attention.

WHAT KEPT RUTH.

"Mother, may I go to see Ada today?" said Ruth, as she tied on her sunbonnet. "You know she is going to visit her Aunt Emma tomorrow, and I won't see her for a whole month."

"Why, yes, I think so," said Mrs. Naylor. "Your dress is clean, and you have all your chores done. Yes, you may go and stay a little while. You will miss Ada very much."

"What if Ada's mother asks me to stay to dinner?" asked Ruth, twisting her bonnet-strings.

"Well, I think you'll have to stay, then," laughed Mrs. Naylor. "Be a nice, polite little girl, and if she doesn't ask you, come right back home. Remember, I can trust you."

So Ruth kissed her mother goodbye and skipped down the lane and toward the little woods pasture that separated her father's farm from that of Mr. Gilbert. It was a pleasant walk, and the two little girls had worn a path going back and forth visiting. The distance was not long, but she was not in sight of home on account of the little hills that shut out the view.

Mrs. Naylor was very busy that day, but along about four in the afternoon she thought Ruth ought to be coming home. "Something may have happened," she said. "I can always trust Ruth, and she never was gone this long before."

"Now don't worry," said Mr. Naylor, who had been away from home helping a neighbor thresh. "Ruth is past eight and she can be trusted. Most likely the girls are having a good time and Mrs. Gilbert has forgotten to send her home."

But to satisfy her he started down toward the woods pasture, saying he would meet her on the way home. Ruth was such a trusty little girl that he walked rather slowly, thinking to give the little girls more playtime, since they would not be able to play together for so long.

"Father! Father!" cried a very joyful but rather faint little voice as he reached the woods pasture. "I thought nobody would ever come."

Poor little Ruth! As she went singing through the woods in the morning she found the cattle in their neighbor's woods breaking down the fence and about ready to get into her father's cornfield. She drove them far back into the woods, calling for help as she did so, but nobody could hear her at that distance. Every time she thought she had the cattle safe from the field and started to run for help they came plunging back, eager for the fresh green corn. So the poor child had to stay at the broken place all day.

"And never a bite of dinner!" said her father, gathering her up in his arms and kissing the tear-stained face. "I am so sorry, little Ruth. You are a brave girl to care for your

father's corn so well. Sit here in the shade and I'll mend the fence in a few minutes."

He brought some rails and repaired the place until he could come back with hammer and nails and materials, and then they hurried to the house. You may be sure Ruth ate a big dinner-supper as soon as her mother could put the good things on the table.

Ruth did not see Ada until she came home from her visit, but she thought she was well paid for her hard day when her father took her to town and let her pick out the dearest little blue and gold watch you ever saw.

"For only one day's work!" said Ruth, happily, as the lady in the store pinned the watch to her new blue dress. "My, but that was a good day's work!"

"It certainly was," said her father. "It saved me many, many dollars, my brave little Ruth."—Hilda Richmond, in Sunday School Times.

GOOD HEALTH.

[By H. E. Pastor, M. D.]

Sleep, Nature's Restorer.

If circumstances permit, try and take a short nap after the mid-day meal. Sleep is a wonderful invigorator, and helps the body to resist more effectually the enervating effects of excessive heat. Cultivate the habit of ample sleep at all times. It lessens susceptibility to disease, and, when disease may by chance be contracted, a cure is more speedily effected. A distinguished physician once said: "I would rather hear that my patient had slept than that he had taken the medicine I prescribed." So, don't forget the "siesta"; it should become a confirmed California institution, especially in our hot valleys in the mid-summer season.

Thirst in Hot Weather.

Don't be afraid of a plentitude of water in the hot season—applied internally and externally. Thirst is Nature's signal for a pressing bodily need. Atmospheric heat above 98½ degrees, to which the body is exposed for long periods of time in the torrid interior valleys of California, puts quite a strain on the physical mechanism, for it then becomes necessary that the bodily temperature be kept below that of the surrounding air. This nature does by the sweating process, which keeps down the body's heat by evaporation. The more heat the body generates the more water is needed to drive off this surplus heat by evaporation. Hence Nature keeps the body bathed in perspiration when it becomes overheated. You can aid Nature in doing this by also taking a sponge bath daily to keep the skin active, and by wearing light clothing. But be careful to take baths in no form when perspiring freely, nor drink ice water or other cold drinks. Such practices are not merely indiscrete; they are dangerous. Cool off slowly.

Lemons in Summer.

The value of lemons as a substitute for drug medication is surprisingly underestimated by the majority of even intelligent people. In the form of lemonade, lemon juice is not only a cooling and refreshing

drink, but is one of the best of all remedies for persons suffering with bilious and liver troubles. It is better than calomel, mandrake root, quinine, or other drugs, and less drastic in action. It stimulates the liver and digestive organs, and tones up the system generally. Lemon juice has many other incidental uses. Dr. Samuel O. L. Potter, a medical authority of the highest standing in California, has written that lemon juice promotes the action of the skin and kidneys, is efficient in acidity of the stomach, will retard hardening of the arteries in advancing age, and is of service in acute rheumatism. It is best taken from a half-hour to an hour before meals, one or two glasses a day. Californians should make a wider use of one of its own distinctive products.

Rattlesnake Bites.

The rattler is common in California and quite active at this season of the year on both plain and mountain. The venom of this snake is held in a small sac or pocket situated at the base of the sharp tooth or fang, which is channeled through its center to make an outlet for the poison. When this fang penetrates the flesh of its victim the poison sac is compressed as you would squeeze a hollow rubber ball in the hand, and the virus is thus injected into the wound. The remedies advocated are various. For quick action the wound should be washed, sucked, then cut out or burned. Permanganate of potash (commonly used on chicken ranches for roup and other purposes), in three to five grain doses, is claimed by some practitioners to be an infallible antidote. A strong solution of the same drug (or echinacea) should be applied directly to the wound in the form of a

lighter, flakier
biscuits

Steady, evenly distributed heat, under perfect control makes a good oil stove wonderful for baking.

NEW PERFECTION OIL COOK-STOVE

For Best
Results
Use
Pearl Oil

A good oil stove is just like cooking with city gas. If you haven't a New Perfection you've missed comfort for years. Bakes,

broils, roasts, toasts. More efficient than your wood or coal stove, and costs less to operate. Cuts out the coal-hod and wood-box drudgery. Keeps your kitchen cool. The long blue chimneys prevent smoke or odor. In 1, 2, 3 and 4-burner sizes, ovens separate. Also Cabinet Models with Fireless Cooking Ovens. Ask your dealer today.

STANDARD OIL COMPANY
(California)

dressing. Stimulants should be used to keep up the action of the heart, which is much depressed. (Strong hartshorn or whisky is used as such a stimulant.) Tie a ligature tightly above the wound to keep the poison as much as possible out of the general circulation and away from the heart. Apply a cupping glass to the wound if one is available to draw out the blood. Back in Illinois, where the writer spent his boyhood and where a more or less intimate acquaintance with the rattler was had, a live chicken was caught in these emergencies, cut wide open and clapped on the wound for this purpose. This was followed by another chicken, then another, till the chicken ceased to turn green.

Pacific Rural Press Market Report

PRICES QUOTED
AS PAID TO
PRODUCERS

San Francisco, Aug. 23, 1916.

Wheat.

Light crops in Middle West strengthen Coast market; local prices again advanced sharply. Local offerings light, coming mostly from the north.

[f. o. b. San Francisco.]

Sonora wheat\$2.00 @ 2.05
Northern club 2.07 1/2 @ 2.10
Calif. club, ctl. 2.05 @ 2.10
Northern Bluestem. 2.10 @ 2.15
Northern Red 2.07 1/2 @ 2.20

Barley.

Speculative business rather heavy, with advancing prices reflected in the spot market. Present prices seem to be bringing heavier offerings from the country, which may check the advance.

[f. o. b. San Francisco.]

Shipping, ctl.\$1.75 @ 1.80
Choice seed, ctl. 1.70 @ 1.75

Oats.

Offerings light, and market firm, with further advances on white, red, and Texas red seed. Offerings of off-grade lots have prevented an advance in feed.

[f. o. b. San Francisco.]

Red feed\$1.75 @ 1.80
Red seed 1.95 @ 2.05
White 1.70 @ 1.75
Black seed 3.00 @ 3.25
Texas Red seed 2.20 @ 2.30

Corn.

Eastern corn continues to advance, and local values show an immediate response. Egyptian also is quoted a little higher, with light offerings of desirable grain.

[f. o. b. San Francisco.]

Eastern Yellow, ctl.\$2.05 @ 2.10
Milo Maize 1.75 @ 1.80
Egyptian 1.90 @ 1.95

Beans.

Very little demand for old crop beans, but stocks so closely cleaned up that values are slow to decline. Local dealers look for a large crop; but the market should absorb it at good prices. There has been considerable contracting in advance for limas in the south.

[On wharf, San Francisco.]

Bayos, per ctl\$5.40 @ 5.50
Blackeyes 3.00 @ 3.25
Cranberry beans 5.25 @ 5.40
Horse beans 3.25 @ 3.40
Small Whites (south) 7.00 @ 10.00
Large Whites 6.25 @ 6.50
Pinks 5.50 @ 5.70
Limas (south) 5.30 @ 5.40
Red Kidney 8.00
Mexican Reds 5.25 @ 5.40
Tepary beans 4.50 @ 4.75

Seeds.

The alfalfa and Oregon vetch crops have been so largely cut for hay that seed in both lines promises to be very scarce. New seed in other lines not yet available, but some small stocks offered at the prices quoted.

Cover Crop Seeds.

[Wholesale prices, S. F.]

Alfalfa, per lb. 23 1/2 c
Oregon Vetch 6 c
Melilotus Indica 8 c
Melilotus Alba 12 1/2 c
Bur clover, recleaned 10 1/2 c
Canada Field Peas 5 1/2 c

Hay.

Local offerings continue to decrease owing to the car shortage, of which dealers are making strong complaints. Local market lightly supplied, with prices accordingly firm. Dealers continue to predict lower prices as soon as large reshipments can be handled; but most reports from the country seem to justify a firm view of the market. A general shortage is reported in northern California. However, local demand is limited, and there is no great shipping business at present. New alfalfa from the river district is of fine quality, and finds a good market.

[Wholesale prices per ton, carload lots, San Francisco.]

Wheat, No. 1\$13.00 @ 14.50
No. 2 10.00 @ 12.00
Tame oats 11.50 @ 15.50
Wild oats 10.50 @ 13.00
Barley 10.50 @ 13.00

Alfalfa 10.00 @ 14.50
Stock hay 8.50 @ 9.50
Straw, per bale35 @ .50

Feedstuffs.

Feedstuffs generally active, and values firm, alfalfa meal, cracked corn, and rolled barley all being higher. Beet pulp is absent from the city market.

[Wholesale prices, per ton, carload lots, San Francisco.]

Beet pulp, per ton. Nominal
Alfalfa meal, per ton. \$18.00 @ 19.00
Bran, per ton 28.00 @ 29.00
Oil Cake Nominal
Cocoanut cake or meal 23.00 @ 25.00
Cracked corn 44.00 @ 45.00
Middlings 35.00 @ 38.00

Deciduous Fruits.

Local market overloaded with fruit, especially off-grade stock, which does not clean up readily. Bartlett pears have advanced, being very closely cleaned up. Apples continue strong and new Bellflowers find good sale here, in addition to a large shipping movement. Canners take all peaches they can get, but the street price is lower. Plums and prunes steady, with a large shipping demand in both lines. Figs plentiful and easier. All melons have declined, with plentiful supplies and only moderate demand. Huckleberries are slightly lower, and raspberries have dropped sharply.

[Wholesale prices, San Francisco.]

Huckleberries, lb 6 @ 10c
Currants, chest \$3.00 @ 4.00
Loganberries, chest 6.00 @ 7.00
Blackberries, chest 2.50 @ 4.00
Raspberries, chest 6.00 @ 8.00

Special Deciduous Market Report.

By J. L. Nagle.

Sacramento, Cal., Aug. 21, 1916.

Continued heavy shipments of Malagas have depressed all markets and the movement of Tokays has also somewhat lowered prices. Practically half of the Malaga crop already shipped.

Eastern crops are now moving but demand for California peaches remains strong. Offerings light and will be from now on.

Mountain Bartletts are receiving good demand; all markets active and prices high.

Ruling prices for the week:

New York.—Bartlett pears averaged \$3.05; Malaga grapes, \$1.38; Thompson Seedless, \$1.25; Tokay, \$2.00; Elberta peaches, 99c; Lovell, 89c; Orange Cling, \$1.26; McDevitt, \$1.35; Duke plums, \$1.88; Kelsey, \$1.84; Gross, \$2.05; Hungarian, \$1.74; Giant, \$1.38.

Chicago.—Bartlett pears, \$2.98; Kelsey plums, \$1.68; Giant, \$2.00; Hungarian, \$2.24; Dukes, \$2.06; Elberta peaches, \$1.07; Malaga grapes, \$1.27; Tokay, \$1.63.

Total shipments to Aug. 22, 8913 cars; total shipments same date 1915, 6774 cars.

Special Livestock Market Report.

San Francisco, Aug. 23.

Practically no change in livestock or wool.

Cattle receipts are practically all California grass stuff, much of it with white faces but very light, averaging around 950 pounds and many too thin to butcher. Good fed Nevada cattle are expected for the six months following Dec. 1; but very little fed cattle come from California.

Sheep.—A bunch of 2000 Lassen county Cotswold-Lincoln spring lambs just off the range brought to delightful weight and condition, is part of the arrivals. This milk and grass fed stock is considered superior to fed lambs.

Hogs.—Very bumily fed, unfinished, oversized stuff characterizes the arrivals.

Wool.—No activity in country

wool; Eastern and local city prices have dropped, though whether the drop is temporary will depend on whether England releases the large Australian surplus which is under embargo. There is considerable of last fall's wool in this market which the holders would like to sell at last year's prices.

North Portland, Ore., Aug. 21.

Cattle.—The week's market opened with over 1200 head. Quality quite fair. Best steers sold at \$7.00 and cow stuff fairly well—tops at \$5.15.

Hogs.—Hog receipts only a thousand Monday. Prices strong at \$9.50 for tops.

Sheep.—Nearly 3700 received Monday on a steady market. Top lambs are still quoted at \$8.25 and other grades in proportion.

Strawberries, chest 2.50 @ 4.00

Tokay, crate 75 @ 90c

Dried Fruits.

The removal of the freight embargo on the Sunset Gulf route should help the dried fruit movement somewhat. Divergence of views between buyers and sellers great as ever, especially on prunes. Low prices recently put out by packers regarded here and in the East as designed to shake the confidence of growers, which they have been unable to do, as the latter are financially strong and have abundant support, some of the prune belt bankers being confident of high prices. Offers have been further reduced; though growers in most districts are holding for over 5c. The peach movement somewhat retarded by delay in naming prices, as well as by lack of packing facilities. Apricots find better offers, but not high enough to bring out much stock. Apples easier with increasing offerings, and ordinary white figs are lower. The old crop raisins are practically all cleaned up, with a continued good demand.

[Net to growers, f. o. b. shipping point.]
Apples, new crop 4 1/2 @ 5 1/2 c
Apricots, per lb, 1916. 10 @ 11 c

Citrus Fruits.

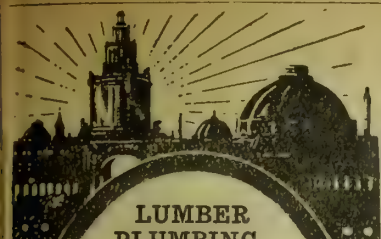

At New York Aug. 21, 14 cars Valencia averaged \$3.30 to \$5.35 with demand stronger. Lemons averaged \$5.85 to \$6.45 and grapefruit \$1.25 to \$2.05. At Boston, Valencia averaged \$3.55 to \$4.90 and lemons \$4.15 to \$6.70. At St. Louis Valencia averaged \$3.75 to \$4.30 with strength on small sizes; lemons \$4.20 to \$6.45.

The San Francisco movement has been about normal for the last week, prices being firmly maintained on the basis of values at shipping points.

[Wholesale prices, San Francisco.]

NOTES.

Fake solicitors are busy in the
Western States collecting money for
organization of national farm loan
associations under the new law.
There is nothing doing until the
Federal Farm Loan organization
shall be completed. A hearing at
Sacramento Sept. 10 will be held by
the Federal Farm Loan Board to
help determine where to locate the
land banks.

The Oak Grove Dairy Farm,
Woodland, reports that five Berk-
shire gilts farrowed 45 pigs; 21
gilts and sows farrowed 206 pigs
last spring. Artful Masterpiece,
sired by the St. Louis World's Fair
grand champion Masterpiece, died
last week at nine years old. Some
fall litters will be born to him, but
it had not been expected to use him
any more. Their herd sire, Im-
prover B, has been grand champion
at Topeka and Hutchinson, Kansas,
and at the 1914 California State
Fair.

The Blatchford Calf Meal Co.
sterling silver cup for making the
greatest gain at the least cost in a
calf-feeding contest went to W. J.
Maine of Rhode Island, whose five
calves gained 2 1/2 pounds per day
from birth to 12 weeks old on the
Calf Meal, new milk, skim milk,
ground oats, and clover hay.

Mr. Haden Smith, of Woodland,
writes us that eighty per cent of his
sales of purebred Durocs have been
made through advertising in the Pa-
cific Rural Press.

Compare the Cost

TWENTY years ago a farmer borrowed \$1,000.00 at 6 per cent straight on the old fashioned loan plan. He has renewed the loan at intervals with constant expense of renewal commissions, abstract charges and recorder's fees, and he still owes the principal sum of \$1,000.00

He has paid \$60.00 interest every year for 20 years, a total of 1,200.00

Total cost to farmer, including \$1,000 still unpaid.....\$2,200.00

Under the amortized rural credit plan, his total interest and principal payment would be \$90.76 a year for 20 years, or..... 1,815.20

A saving on a loan of \$1,000 of.....\$ 384.80

The following table shows the amount of INTEREST SAVED by borrowing on the amortized or rural credit plan:

Amount Borrowed.	Annual Payment Amortized Loan.	Total Payments, 20 Years.	Straight 6 per cent for 20 years and Principal Repaid.	Interest Saving Amort. Loan.
\$ 1,000	\$ 90.76	\$ 1,815.20	\$ 2,200.00	\$ 384.80
2,000	181.51	3,630.20	4,400.00	769.80
4,000	363.02	7,260.40	8,800.00	1,539.60
8,000	726.05	14,521.00	17,600.00	3,079.00
10,000	907.56	18,151.20	22,000.00	3,848.80

We think this amortized loan which can be paid off any time is the best loan, for the farmer, being offered in California, but if preferred, will make 10 year loans, annual interest and favorable prepayment options. Both types, each being for a long term, offer a big advantage in selling a farm, for each gives buyer longer time to pay out than sellers or other loan companies generally grant.

Full information given on request without obligation to borrow.

San Francisco

The Wheat Yield Tells the Story

of Western Canada's Rapid Progress

The heavy crops in Western Canada have caused new records to be made in the handling of grains by railroads. For while the movement of these heavy shipments has been wonderfully rapid, the resources of the different roads, despite enlarged equipments and increased facilities, have been strained as never before, and previous records have thus been broken in all directions. The largest Canadian wheat shipments through New York ever known are reported for the period up to October 15th, upwards of four and a quarter million bushels being exported in less than six weeks, and this was but the overflow of shipments to Montreal, through which point shipments were much larger than to New York.

Yields as high as 60 bushels of wheat per acre are reported from all parts of the country; while yields of 45 bushels per acre are common.

Thousands of American farmers have taken part in this wonderful production. Land prices are still low and free homestead lands are easily secured in good localities, convenient to churches, schools, markets, railways, etc. There is no war tax on land and no conscription.

Write for illustrated pamphlet, reduced railroad rates and other information to

Supt. of Immigration, Ottawa, Canada, or apply to Gilbert Roche, Canadian Gov't Agt., Cassan Bldg. Exhibition Grounds, S. Diego, Cal. Canadian Government Agent.

ANGELES

Cows for Fruit---Cover Crops for Both.

A declining 230-acre prune, peach, and apricot orchard demanded plant food and humus. Cover crops have been planted, and 50 dairy cattle and 2000 hens bought. Trees and crops are now fine. Fruit and milk are the cash crops.

[Written for Pacific Rural Press.]

ONE hundred and eighty-five acres of prune trees 25 years old were going to the bad on the Sorosis Fruit Ranch in Santa Clara valley. The tops were dying out. They had to be cut back more severely each year, and they couldn't seem to recover.

But they did. This year of a supposed light prune crop, 20,000 board feet of new props had to be bought. Even now, some of the limbs have broken down. The tops show very few dead branches. The leaves are thrifty except for the results of scale. The growth has been good. The soil is light loam on top. Underneath it is gravelly. Deeper down, as shown by the deep creek banks on the place, consists largely of small boulders. Well-digging revealed clay and cobbles all the way down.

Commercial fertilizer wouldn't supply the humus. Manure was unavailable. Canadian field peas and barley were planted on 14 acres in 1911. They made an immense crop of green stuff which was plowed under the next spring. In the June following, about 50 dairy cattle were bought, hoping that they would pay their way and furnish manure free f. o. b. the ranch.

They were installed in an eight-acre corral winding along the creek bank and including a beautiful eucalyptus grove but no fruit land. From January to July, 1916, they had nothing to eat but cover crops grown in the orchard; and cover crop silage was put up to supplement alfalfa from July to January.

Cash from Cows.—The herd is maintained at its original size. Manager Frank Abernathy estimates that the 35 cows milking all the time, give an average of 100 gallons per day throughout the year. Milk is weighed twice a month and tested in the ranch Babcock tester once or twice per year. It has been sold at 20 cents per gallon f. o. b. the ranch, ever since the herd was started, to retail milk men of Saratoga and Los Gatos. They sterilize the cans and return them free. There is ordinarily a surplus of 10 gallons a week of cream sold to the creamery.

The prune crop in 1911 was light—perhaps 100 tons from the 185 acres. Next year it was about 300 tons. In 1913 it was about 152 tons; in 1914, 190 tons; in 1915, 170 tons; in 1916 not yet gathered, but practically all that the trees will hold.

The cover crop in 1912 was planted for Canadian field peas, but proved to be common garden peas with many pods but small tops. The third year, about 150 acres were planted to German imported vetch (probably purple vetch) and one lot was planted to barley alone for the cattle. In 1914, barley alone was sown and pastured down. The vetch variety desired was unavailable. Nothing was left of the barley but the roots.

Cover Crop Silage.—In 1914 and 1915 peas from the cannery at Milpitas were bought at 12½ cents per ton and shipped to Sorosis ranch at a freight cost of \$1.60 per ton. These were siloed for the cows. Then it was decided that it would be cheaper to silo some of the cover crop.

In October, 1915, Mr. Abernathy drilled 70 pounds per acre of Canadian field peas on about 100 acres of the orchard. They came up a good stand in December, after the early rains. About half of them were allowed to grow until early May. A few of the peas were mature, and the vines, five feet long, a dense mat. A 10-foot hay rake was run down the center of each row in this 50 to 55 acres. The vines broke off easily at the ground. One of the teamsters would rake enough to keep three teams busy hauling to the silo for two or three hours. Then more would be raked, to avoid curing.

A six horse-power gas engine which pumps liquid manure from the concrete pit onto the orchard through surface irrigation pipes, was hauled around to run the No. 11 silage cutter. It would be cheaper to use a larger cutter. The three teamsters did their own raking and loading onto orchard trucks. One man helped unload, one took care of the machinery, etc., and one tramped silage.

It would have been a steady week's work to fill the 120-ton silo; but they let it settle several times and filled it again each time. A little green corn silage has been added this fall; but there is still a lot of the peavine silage left. The cows like it and clean it up well, though not with the same greediness as corn silage, and not quite so eagerly as the cannery vines, on account of the ranker growth of field peas. Six hundred pounds of salt was added as the vines were siloed, but no water. They were not dry.

Some of 50 Cows Which Eat Nothing but Orchard Covercrops from January to July, and Are Fed Covercrops Silage the Rest of the Year. Their Manure is Returned to the Orchard.

account of the ranker growth of field peas. Six hundred pounds of salt was added as the vines were siloed, but no water. They were not dry.

"No feed will bring milk like pasture," says Mr. Abernathy, so when the cows were put on silage and alfalfa hay in July, the milk decreased a little, and amounted to about 75 gallons daily in mid-August.

Where had the cows been pastured?

Cover Crop Pasture.—Last October, about 130 acres of the orchard were sown to Oregon vetch and barley, about 50 pounds of the former and 9 of the latter per acre. The barley stools so that more is undesirable.

On this, the cows were pastured every day between January 1 and July, 1916. It was separated into three blocks by a single wire fastened temporarily to trees with pieces of baling wire. When one block showed effects of pasturing, the cows were turned into another. The trees were not noticeably injured.

The cows were turned onto it about 2½ hours in the forenoon, and 1½ hours following the afternoon milking, but were taken off as soon as they showed a tendency to wander. No herder was required. They never bled. Peas have made good pasture, too, but were not used for that purpose this season. Vetch and barley are preferred for pasture. Manure from the cows was deposited in the orchard.

Cover Crop Hay.—Besides silage and pasture, the cover crops furnished hay, but of poor quality. From about 25 acres, the peas were raked clean and hauled to the five-acre fruit dry-yard where they cured perfectly into about 50 tons of hay. Some of the vines were 6 to 10 feet long and were

EDITORIALS

THE WEEK.

A GAIN August has gone astray and set flowing a lot of electric fountains—making a meteoric display for which the month has no permit except amid the mountain lakes and peaks of the Sierra Nevada. Fortunately, however, this second transgression of the harvest moon brought little more than a sprinkle to broad interior valleys where there was outspread perishable property to be injured, and such regions need only take a hint that the fall rains seem early on their way, and that all should hasten ingathering as much as possible.

We wish other menaces could be as easily disposed of, but the wish does not insure the fact. As we write on Tuesday, it looks as though transportation, which is now the farmers' one indispensable thing, might be broken up, with great danger of ruinous losses to his year's work. The trainmen's brotherhoods have ordered a strike on all railways on September 4, unless their terms are accepted before that time. President Wilson is asking Congress for laws which he thinks will prevent stoppage of trains, and if such laws cannot be put in action before the strike, it is said the trainmen will be placed under military draft to run the trains. The chances are that such an order will be easier to issue than to enforce.

The men will probably stay at home and be careful to keep out of drafts.

HAS THE PUBLIC ANY RIGHTS?

M EANTIME the public abomination in the situation endures. We are getting many rude awakenings to the impotence of civilization which we have been dreaming was the acme of terrestrial attainment. The world war is such an awakening shock. If this railway strike is not arrested it will be another. The idea is surely shocking that a few thousand men, whether they are workmen or employers matters not, should be able to endanger the lives and livelihoods of a hundred million people, by serving their private interests after they have enlisted to discharge service in a public utility. It is perhaps unfair to condemn the few thousand because of the impotence of the many millions. It is the fault of the people at large that their created agencies of transportation do not transport. The public does not charter railways for the wealth or pleasure either of the managers or the operators, but to do public service and to keep on doing it, except in face of disaster beyond control of man. We are threatened with disaster which can be and should be controlled. If this pending strike is not arrested, this Nation will perhaps clearly see itself a pitiable object, standing feebly in the view of the world with its national life-blood clotted in its veins and arteries, and its millions in misery, because it has given a few thousand people a chance to operate or not operate its public utilities as they may choose. We are not judging where the right is between those who are contending over hours and dollars of their own. It is the job of a high court of economics to determine that. We only

know that from the point of view of food production and consumption refusal to do work in running trains after having engaged to do it, is a public offense, which should be made impossible because it will bring losses upon millions of people who have worked nearly a year past to get a harvest which will keep other millions of people alive nearly a year to come. Our legislators have been so busy considering men's rights and women's rights, State's rights and Nation's rights, labor's rights and capital's rights, that they have probably forgotten that the public has any. We believe everything on earth should have its rights. We believe also that no one in pursuit of rights should destroy the rights of another. The vested right of the public is to have railway trains run: let the government secure the enjoyment of that right.

TO AMEND FRUIT LAWS.

T HE committee appointed by resolution of the Visalia Fruit Growers' Convention to initiate a movement toward codification and revision of existing horticultural laws of California, has issued an invitation to fruit-growing and handling societies to send delegates to a meeting which will assemble in the State capitol at 10 a. m. on September 6. The convention committee, which consists of G. H. Hecke, Geo. P. Weldon, and E. J. Wickson, is merely authorized to take the initiative and appoint a larger and wiser committee, which may be in session some time and may employ counsel to put its recommendations in shape suitable for presentation to the next fruit growers' convention, which will be held in Napa November 15. Thence such suggestions as the convention approves will be submitted to the next Legislature. The preliminary committee concluded that the best way to decide what lines of amendment were desirable, and to secure the assistance of those wisest in drawing them, would be to invite all interested to a conference, and a day during the State Fair seemed to have good drawing power. It is to be hoped that all fruit organizations will send delegates, and we doubt not all, whose personal interest in the subject draws them, will also be welcome to take part in the proceedings. It will be remembered that the desirability of the revision of our horticultural laws was urged by Mr. Hecke at the Visalia convention, and that the convention adopted a resolution defining the duties of the permanent committee as follows:

This body of representative citizens should be authorized to take up the whole code of horticultural acts, determine broadly what changes should be made to harmonize the existing statutes and to recommend for public discussion such new acts as are expedient and co-ordinate them with those already in the collection. In other words, the committee would be empowered to take up every principle now contained in our laws, which has been tested in practice and approved by court decision, and have all this material reconstructed into a concrete whole, which would be free from the imperfections of the present laws. This committee should also recommend a broad plan for initiating future enactments that might be rendered necessary by new or changing conditions. This plan could be adopted, if satisfactory, as the standing policy of the horticultural interests of the State.

Under this broad charter the permanent committee would examine the policies and practices involving promotion, protection, standardizing, etc., and thoroughly revise all legislation affecting our fruit-growing—not only from its own point of view, but in its relation to other State agencies and institutions. It will be an exceedingly interesting and important work.

TAKE A LOOK AT THE SHEEP.

O UR advice to readers who go to the State Fair next week is that they do not forget to go to the sheep pens and look, listen and think. There will be a lot of good sheep on exhibition, and suggestive explanations and conversations will be in the air, so you can get your eyes and ears full of things which are now especially worth thinking about. There will be more pigs than sheep, and we are partly to blame for that, perhaps, but we wish to purge our conscience of pricks for neglect of the sheep—hence this paragraph. We do not wish to get into the fix of the congressman who voted, some years ago, for free wool, and after-

wards confessed that he had been "ashamed to look a sheep in the face" ever since he was guilty of that injustice. We also know that there are some of our readers who do not like the society of pigs and pork, and have more taste for lambs and the chops thereof. So here is our chance to even up between animals and people, and therefore we say: put some sight and thought on the sheep!

But it is, perhaps, not necessary for us to display this confession and repentance. Sheep and lambs have been talking pretty loudly in their own behalf for some time back to everyone who keeps his eyes on our market quotations and reports of sales as he should. If he has gone a little farther and written to our advertisers of pure-bred bucks (as he also should), he has found that good boars have not much on good bucks, in the way of keen demand and prices, which show how sharply people want the agencies for improvement. The fact is that not only in California, but the country over, American farmers have awakened to the new and enlarged opportunity there is, not for the large ranger so much as for the farmer, perhaps, in the higher prices, which have to be paid for flesh foods and which the experts tell us are sure to last for a long time, if they ever recede to old figures. The lesson is, of course, that all owners of idle range who have capital enough to stock it and to man it sufficiently to give the sheep shelter, protection from dogs and coyotes, and to store up safety-feeds against bad weather and bare land, ought to be thinking about keeping their lands busy with sheep. If sheep can be safeguarded they will pay well on land and investment, not at all up to the needs of the pig. The sheep cannot do much for himself except hunt grub, but he will grow well on stuff which will keep a pig squealing all the time. And the same thing is true of a small band of sheep on a mixed farm; they will clean up and get fat on stuff which makes the farm look ragged and shiftless, and will turn into money-saving or money-making form, nearly everything which makes a farm and its owner weedy and discontented. No matter, therefore, how much you get interested in steers or hogs as parts of your old-fashioned mixed farming, there will still be room in your heart and your purse for the peculiar and characteristic service of the sheep. And if you do not already do mixed farming you can probably mix your specialty cropping to more advantage with a few sheep than you can in any other small way—except with hens, and their requirement of personal attention may be greater than you wish to give. Sheep will be joyful over a small amount of personal affection which would make a hen jealous and perverse.

VALUE OF A MERINO FOUNDATION.

W E HAVE no idea of trying at an essay on practical sheep husbandry. Our associates are doing things in that line nearly every issue—firing their machine-guns with munitions drawn from the experience of many California farmers who are now carrying bands of sheep on farms, of small to moderate dimensions, and are finding it very profitable. It is our conviction that many more can do well along the same line, and therefore our writers are always on the lookout for facts of practical experience with materials and methods.

There are many reasons why California should immediately take precedence of other States with breeding bands of pure-breds of dual purpose sheep of all popular breeds. It is not to be expected that any single breed will become so great

California Weather Record.

The following rainfall and temperature record is furnished the PACIFIC RURAL PRESS by the United States Department of Agriculture Weather Bureau, at San Francisco, for the week ending at 5 p. m., August 29, 1916.

STATIONS	Past Week	Rainfall Data		Temperature Data		
		Seasonal To Date	Normal To Date	Max'm	Min'm	
Eureka00	1.46	.19	62	50	
Red Bluff00	.68	.00	112	68	
Sacramento00	.07	.00	96	58	
San Francisco07	.32	.01	88	59	
San Jose01	.01	.04	82	54	
Fresno07	.07	.00	102	46	
Independence12	.20	.00	94	52	
San Luis Obispo00	.00	.02	84	50	
Los Angeles00	.00	.00	92	60	
San Diego01	.08	.00	80	62	

that it will exclude others from shares of public favor. This has never been so and never will be, because merits are distributed, because tastes differ, and because breeds vary in their adaptation to soil, weather and feed conditions, and because California has wider diversity in these conditions than any other State. Therefore, on the pure-bred side we shall have flocks of all good breeds, including several which have not yet attracted much attention. But the point which we would impress on the remembrance of those who may plan for sheep, either for home use or the market, that we have in this State a foundation stock for crossing with the pure-bred than which there is no better for our Western conditions, and that is the merino. The suitability of American and French merinos for California was demonstrated beyond all question when our wool production was greatest, and if, after the war, our wool is reasonably protected, our fine wool product will surely be great again. No matter how much land other industries may need, there will still be plenty left for sheep, and the small farmer will always find plenty of ewes at reasonable prices to bring under the improving influence of his pure-bred rams, for meat-making, with a lot of medium wool as a by-product.

The desirability of the merino foundation is now being more widely recognized than ever before. One indication of this is found in the popularity of the Corriedale, which is now recognized as a breed and is entering the United States from Australia and New Zealand, where it has been developed by selection and inbreeding (as all breeds were established) from an original merino cross. California could have started "Corriedales" for herself half a century ago, for there were men then living here who saw the chance of advantage in a cross of English sheep upon the merino, and premiums were awarded for such sheep at our State Fairs fifty years ago—because the merino showed such distinct adaptation to this country. The trouble was, however, that our wool has had more politics in it than even sand and burs, and the politics could not be scoured out of it. And recently, it has more politics than ever, and, in fact, would have died of politics if the European war had not been administered as an antidote. But all such adversity has not ruined our merino foundation, and if it is not held open to bombardment by free importation after the war, we shall have new structures reared upon it, not only in the great interior range States, but in the forests of California coast, foothills, and mountains, and on the farms of California valleys, which will be greater than anything achieved in the past. Therefore we need in California all good breeds of sheep, not only for their own sakes, but for their values, as they are brought upon our enduring merino foundation.

FARM LOAN BOARD MEETING.

THE United States Farm Loan Board, the group of men which will bring the new legislation on mortgage credits under government auspices into operation, has telegraphed that it will hold a meeting in Sacramento on September 9. That will probably be the only meeting held in California as the Board is in a hurry to get back to Washington and to work on organization of its undertaking. Its chief object in swinging around the circle is to get points on the location of the twelve district land banks which it is empowered to establish. It will still probably be several months before the machinery for making loans will be in operation. The members of the board were named and described on page 127 of our issue of Aug. 5. The Orange Judd Farmer gives them this send-off:

The federal farm loan board includes a practical farmer and farm banker, an excellent lawyer, a mortgage investment expert and a leading farm expert and writer, together with the secretary of the treasury as an ex-officio member. These men will make a fine combination.

Those who wish to see and hear these men must look out for announcement of hour and place of meeting in the daily papers. Some close attention may need to be given to this matter for it will be the closing day of the State Fair and the Admission Day holiday and it will be easy to overlook things in the crush at the capital—if the trainmen do not stop the world before that date.

Queries and Replies

By the Editor

INQUIRERS GIVE FULL NAME AND ADDRESS.

Top Grafting Almonds.

To the Editor: I have about 300 soft-shelled almond trees about 23 years old. Can I have them grafted to French prunes? The trees are very thrifty but do not bear well. There is no local market for almonds, but a good market for prunes. What time of the year should the work be done?—D. M., Porterville.

If your almond trees have good trunks, free from sunburn and decay, they will carry new tops of prunes very well. The grafting should be done a little before the new growth starts, probably about February in most valley places. Put several scions in each tree, working in the branches just above the main forking.

Peppers Going Off Below.

To the Editor: I have pepper plants that have done finely until the peppers are about half grown, and then the vines begin to die. The roots get dry and break like a stick. The upper part of the vine stays green quite a while after the roots are dead. Last year they had lots of manure. Some I watered quite often and some I did not water at all, but they died just the same. This year I have put no manure and have watered about four times since planting. They were all transplanted. Can you tell me the trouble and a remedy?—W. C. M., Newman.

You have a ground trouble, either a root-destrorying organism or alkali, to deal with. The former is usually indicated by a wilt of the whole plant. Alkali is more apt to act as you describe. For both root-fungi and alkali the escape is to run away rather than to try for remedies. Try a new piece of land.

Pollination of Walnuts.

To the Editor: I have a walnut, supposed to be the Placentia, which bears well. I have another supposed to be Franquette which blooms very late and the nuts most all fall off when the size of peas—for lack of fertilization I think. Is there any variety that could be budded on that would bloom at same time and assist in fertilizing—or what could be done? The trees are 10 years old, good growth and thrifty.—W. V. R., Gridley.

There is very little accurately known about pollination of walnuts. Our own limited observation indicates that it is not necessary to have the catkins coincident with the pistils. We have reason to believe that the pollen hangs around and is effective for a considerable time. If we had your conditions we should jump free from the pollination problem and graft over the whole tree of the suspected Franquette with scions from the suspected Placentia and thus get two good bearing trees instead of one. If you can get good Placentias you do not need to worry about losing bad Franquettes.

Mites on Almonds.

To the Editor: I am sending you an almond twig. Is this what is called the red spider? I saw in the Pacific Rural Press some time ago that the spider made its appearance about the first of May. This trouble came on the tree last year about the middle of July and this year about the same time. It does not kill the trees, but most of the leaves come off and then the trees leaf out again, and, of course, it checks the growth. I want to find out what it is and what will kill them. If they make their appearance about the middle of July how long before that time can I spray them and kill them?—E. L., Winton.

This is not the red spider (byrobia) which does most of the mite-work on the almond, but it is a closely related mite (tetranychus), one sign of which is that it makes more web than you usually see when the byrobia is on the job. You are mistaken about their making their "first appearance in July." They hatch from eggs which go through the winter on the bark, and, if you are handy with a magnifier, you can see them hatching out very soon after the leaves appear. They are of course very small. Their multiplication becomes more rapid as heat and dry air prevail and you see in July the bad effects on the tree which the mites have been working towards for two or three months. It is to prevent this that sulphur spraying (dry or wet) should begin early, as soon as the weather gets dry and hot. Do not wait for the

tree to look bad because it is then too late for complete protection. Of course it is better to sulphur as soon as you see trouble than not at all, but it is better still never to see trouble.

Nitrate of Soda.

To the Editor: I am thinking of using nitrate of soda for a fertilizer. Will you please tell me the time to use it and the quantity to use and how to apply it?—G. A. G., Arbuckle.

Nitrate of soda is very soluble and should be applied when the plant is ready to use it—that is, when it is already growing. It needs very little water to dissolve and distribute it: too much water will carry it out of reach of the plant and waste it. The time of the year therefore depends upon whether the plant is growing or not, and with a grain or forage crop it is usually best toward the end of the rainy season. With an irrigated crop it can be used at other times, if the plant is ready. For vegetables to reach condition during the rainy season it should be applied early in their growth. The amount to use is very important, for too much is not only a money loss but it may kill plants. The standard prescription is 200 to 300 lbs. per acre; evenly distributed, not bunched around plants.

Improving a Charcoal Pit.

To the Editor: How shall I treat the soil over an old charcoal pit to put it in good shape for garden, or is it in good condition?—G. E. F., Fair Oaks.

There is probably nothing the matter with the soil except the possible burning out of organic matter and the hardening due to this and to the effect of the potash from the ashes of the wood burned in starting. There is nothing detrimental in the particles of charcoal which remain. We should plow in a lot of manure to restore the humus and lighten up the soil, and go ahead as though nothing had happened.

Red-Humped Caterpillars on Apples.

To the Editor: I am mailing you under separate cover some bugs found on an apple tree in my orchard. Please tell me how to get rid of them.—M. T. S., Davis.

The insects are the "red-humped caterpillar." They are often found on fruit and other trees and are very destructive, but are seldom a great pest because controlled by their natural enemies. When a bunch of them appears on a young tree, they can often be conveniently hand-picked and destroyed. On large trees they are killed by spraying with arsenate of lead just as spraying is done for the codling moth, and when they are abundant this should be done as soon as they are observed.

Grapes and Watermelons.

To the Editor: I wish to plant grapes on land on which I have killed all Bermuda grass this summer. Which is the best time to plant vines, early or late in spring? Is it good to plant watermelons between the vines? Is this hard on the vines? Will I gain with watermelons as much as I would afterwards lose on my grapes?—H. N., Dinuba.

We congratulate you on killing all the Bermuda. Our readers would like to know how you did it, whenever it is convenient for you to write out the method. Vines should be planted when the ground is in good condition during the winter, say in February or earlier. If you wait until the almanac says it is spring you may find vine growth starting, and planting should be done some time before that. Watermelons are not hard on vines if the ground is cultivated well until the melons spread and if, after that, the ground right around the vine is kept from baking hard. So far as growth of the vines the first year goes, you need not count on losing anything in the growth of them. Whether you will make anything by growing the melons is a question of selling on which we cannot prophesy. Whether you will make anything on the vines depends more on water in the prohibition amendment than in the melons.

Pruning Trees After Fruit is Off.

[Written for Pacific Rural Press.]

There is considerably more late summer pruning of apricots, peaches, and prunes, this season than ever before. Its maximum benefits will be obtained by those who pruned directly after the fruit was off, but it seems worth while to do it at any time now.

Arguments against the practice are that it removes functioning organs (leaves) of the tree, starving it to that extent; it opens the inside to danger of sunburn; and in some districts may help the disease known as apricot rust.

Arguments for the practice are in general, that it directs all the energy of the tree into the fruit spurs which remain, developing them so they can set and mature fruit; it tends to cause the leaves remaining, to function later in the season, thus making up for the loss of those pruned out; it prevents waste of plant food in developing wood, buds, and spurs which would be pruned out in winter anyway.

Among those who practice apricot summer pruning is G. H. Waters of Pomona. He wrote us July 22: "I think I have demonstrated beyond any question that summer and fall pruning of apricots is much the best. While the crop was very short this year, it was not from any fault of the pruning, but because of heavy rains we had at the time they were in full bloom. Peaches I do not prune heavily in the fall, but usually in January. We are figuring now on pruning apricots in August and September."

Another is J. M. McKinnon of Saratoga. This is the fourth year he has pruned apricots right after the fruit was off; and several of his neighbors visited him this summer to learn and practice his system. He has about two acres of Blenheims 20 years old and 1½ acres seven years old. Since the young trees were later in maturing their fruit, the old trees had been pruned before all fruit was picked from the young ones this season.

From the 3½ acres, he got 16 tons green this year; 17½ or 18 tons last year; about 23 tons in 1914. The year before that, the orchard not having been summer pruned, there was only 11 tons. However, the young trees were too young to bear much that year anyway.

Previous to that, the orchard had been bearing irregularly; and one corner had never borne at all to speak of. That corner is now the best yielding part.

"Since I've been summer pruning, I get strong blossoms and good crops," says Mr. McKinnon.

The older trees do not grow after the fruit is off, but the young ones do. For this reason, the young ones are pruned later, as the new growth is not desired or necessary here. Some cuts on the young trees this summer were an inch in diameter.

No irrigation is given in fall, and the trees have given no evidence of sunburn. No fertilizer at all has been given the apricots.

Peaches and prunes are also pruned right after the fruit is off, though this is so late that the benefit is less noticeable. Perhaps a

light irrigation immediately after pruning would give new lease of life to the leaves without starting new twig growth.

Pruning System.—The same pruning system is followed as is common in winter pruning. On the apricots, the tops are thinned to admit sunshine. Only about three inches of the new growth remaining is left on ordinary limbs. Here is a saving in next year's fruit thinning. The peaches (Salway) are gradually being worked over to apricots and less attention is given them.

The prunes are simply thinned out every year without cutting back new growth, and Mr. McKinnon says he gets new spurs and shoots throughout the trees every year by that system; so new fruit wood is always coming on.

COSTS FOR TWO YEARS OF VENTURA FUMIGATION.

[By County Horticultural Commissioner A. A. Brock, Santa Paula.]

In Ventura county 162,583 trees were fumigated during the fall and winter of 1914-15 with 14 outfits. This cost the citrus growers \$44,033.61, averaging a fraction over 27 cents per tree. In some parts of the county the cost was as low as 15½ cents per tree, while in other districts the cost ran as high as 34 cents, but in most districts the average cost for large trees was 22 to 27 cents per tree.

In the fall and winter of 1915-16, this county fumigated some 132,329 trees at a cost of \$29,903.39. This was an average of 22.5 cents per tree.

The difference in the average for the two years is probably due to the fumigating machines. Almost every outfit was equipped with them in 1915-16; while a number of them were not, in the preceding season.

The past fumigation season was not so heavy as in 1914-15; but this fall and winter, it will be very heavy.

COWS FOR FRUIT—COVER CROPS FOR BOTH.

(Continued from front page.)

too coarse to be relished, though pretty well eaten. Perhaps chopping would improve them. Some of the peas passed through the cows and were relished by the hogs which follow them in the corral. Some of the vetch was mowed, but it was such a mixed mess that very little was made into hay.

Cover Crops Plowed Under.—Not all of the cover crops were fed. A lot of the peas have been simply plowed under, including what was left after the 10-foot strip was taken from the centers for silage. All that was left of the vetch and barley was turned under for available nitrogen and humus. The hay stubble was irrigated from the creek in May before plowing, and on certain gravelly spots where the peas were most mature, a good volunteer crop followed.

Tractor.—Much of the plowing last year was done with a "Caterpillar 30," plowing an acre per hour without stopping even to eat, from 5 a. m. to 7 p. m.

In August the orchard had been cultivated four times with an 11-foot double disk and then once with a weed cutter which threw up moist dirt.

Horses.—Eight horses are kept on the ranch to plow close to trees and haul fruit, etc., but they are fed boughten oat hay and barley principally.

Swine.—Five brood sows are kept in pens on the steep creek banks within the corral. Their pigs follow the cattle. Many are sold as weanlings to neighbors. Some few are fattened. The pig feed is green-cut cover crops, surplus skim milk, ranch kitchen garbage, and a little barley when fattening. The herd boar is a purebred unregistered Poland China.

Poultry for Manure.—A flock of some 2,000 hens has been kept for the same reason as the cows: they were expected to pay for their keep and deliver manure on the ranch

free. Green feed is furnished them from the ranch. Balanced poultry feed is bought, usually by the carload. The poultry, as well as the cows, are far more than paying their way.

Handling and Feeding the Herd.—When not pasturing cover crops, the herd is kept in the wooded, well-drained corral. This is divided by the barn and a cross fence in which a circular concrete tank supplies both divisions.

Alfalfa hay, bought in neighboring fields and stored loose under roof in the corral, is fed ad libitum from July to January. It is cut young and retains its leaves and color. The sheds have extensions so cattle can feed in the dry in winter. The silo stands at the end of a long light concrete-floored barn in which the silage is fed. Cows are in the barn at milking time only, the year around.

Forty pounds of silage a day per cow is fed, in two feeds, if they care for that much. It keeps as well as corn silage and has a good smell. About two feet on top is wasted—the rest is fed about two inches per day maximum. The change from orchard pasture to dry feed is not sudden, because the pasture is pretty dry in late June, and the cows do not worry when shut out of it.

The herd bull has been a purebred Jersey. The one now in charge is a purebred Holstein, Colantha Sir Pontiac Aaggie 6th. He was turned loose in one division of the corral with a number of cows when we saw him, though one of the rules in the record book which hangs in the barn is, "Be careful to record each time a cow is bred."

The cows are all good grades showing blood of all the common dairy breeds. All are tuberculin tested. Three were taken out at the last test.

Calves from the best cows are raised to keep the herd to its usual number. Very few are bought.

Manure Disposal.—A rectangular concrete tank about 12x14x6 feet is imbedded in the sloping ground low enough below the barn so that a four-inch pipe drains liquid manure and flushings into it through a ¼-inch mesh wire screen. A No. 2½ centrifugal pump, run by a 6 h.p. engine, drains the tank by pumping into surface irrigation pipe which leads to the orchard.

For the solid manure from the barn, a scaffold is built out level with the floor far enough so that a manure-spreader is backed up under it. Thus the iron-bodied wheelbarrow loaded with manure is easily run out and dumped direct. Two or three times a week, this is spread in the orchard.

The corrals, which get most of the manure, are cleaned up occasionally, though doubtless there is a great waste by its draining into the creek in winter. However, even then, most of the manure is dropped under cover and can be saved.

Thus the orchard feeds the cows and the cows feed the orchard, and cover crops feed both.

What stocks are you going to have your nursery trees on for next spring's planting?

Peach blight spraying must be done in November.

FEEDING CITRUS TREES FROM MANGER.

[Written for Pacific Rural Press.]

What amounts to feeding and watering orange and lemon trees in a manger is practiced by the National Orange Co. on its 780-acre orchard of 65,000 Valencia, Navel, and Eureka trees near Corona. A "manger" or two per tree is provided in the shape of basins, the tops of whose sides are level, however steep the ground. Each basin is as wide as the spread of the tree and occupies all or about half the space between two trees in the rows as they run up the slope. This leaves the centers between rows running up the slope, free for growth of cover crops. Bur clover, melilotus, and weeds are grown in these centers and cut twice in spring with scythes. The green stuff is simply thrown into the basins, along with prunings, manure, straw, fertilizer, etc. This mulch in the basins keeps them always moist between irrigations so that the roots can come up to the fertilizer.

The first cover crop was being cut late in February, the melilotus averaging six inches over knee deep to a tall man and supporting similar growth of bur clover. It was proposed to irrigate the centers soon after cutting if necessary, to get another growth of cover crop. This second growth having been cut, the stubble would remain unirrigated all summer, forcing the citrus roots to feed in the basins.

The soil is pretty well sprinkled with what seems to be a lava gravel and is the same several feet down. It does not seem to cement, according to Foreman D. Rycraft; though of course it would bake if irrigated and then uncultivated or unmulched. We are not sure of the economy of leaving the centers unirrigated and unproductive all summer, but perhaps there is not water enough available here to grow a summer cover crop without letting the trees get thirsty. Very little mottle leaf was observed on this orchard.

How Much Nitrogen in Clover Nodules?

[Written for Pacific Rural Press by W. M. Mertz, Riverside Experiment Station.]

[Note.—Last week we printed a computation of the nitrogen in mellilotus under the title "Available Nitrogen 400 Lbs. for \$6." The data assumed by Mr. Beinhorn are very far from correct as to the nitrogen content of nodules. We asked Mr. Mertz for correct data, as the Citrus Experiment Station has done more than anyone else to determine cover crop values.]

The question of the relative value of the nitrogen in the tops and the roots of legumes, such as the clovers, is frequently misunderstood. Because of the fact that the nitrogen additions are made by the organisms in the nodules, many people have the idea that all this additional nitrogen remains throughout the life of the plant in these nodules. This is not the case, for the nitrogen derived from the organisms is utilized in the building up of tissue as well in the tops as in the roots, and never becomes very highly concentrated in the nodules themselves.

A number of different analyses of legume roots as compared with the tops, show on the average about one-half the percentage of nitrogen in the roots as compared with the tops. In other words, mellilotus clover that will show a nitrogen content of 3.15 per cent in the dried tops will seldom show over 1.5 per cent in the dried roots. When we reduce this to green weight, the percentages are very much smaller; since these plants at the stage at which they are plowed under usually contain 75 to 85 per cent water. The question of the actual nitrogen content of the legumes themselves was put up to Doctor McBeth, who has made numbers of such analyses. According to him these nodules, after being thoroughly dried, vary from 3 to 8 per cent nitrogen, the latter being found extremely seldom. A 2 per cent nitrogen content as the nodule naturally exists would be extremely high.

A 20 per cent content would be absolutely impossible. Even were the nodules to be considered as absolutely dry weight, they would have to be equal to chemically pure sulphate of ammonia to actually contain that amount of nitrogen. In fact most of the high-grade nitrogenous compounds are much lower in nitrogen than this. Free nitrogen being a gas does not exist in the form of fertilizer.

WALNUT PROSPECTS.

[Written for Pacific Rural Press.]

With the exception of 1915 this year's crop of walnuts in the State is expected to be the heaviest on record, according to the California Walnut Growers' Ass'n.

From present prospects this year's crop will amount to about 12,000 tons or 18 to 20 per cent less than last year, which was an unusually good one from a quantity standpoint. The nuts this year are of a very good quality; and while the price will not be set till some time in September it is expected that it will be somewhat higher than last year.

The association places estimates by counties for the coming crop as

follows: Santa Barbara, 80 per cent with very little blight; Ventura, 100 per cent; Orange, about 80 per cent; El Monte District, 65 to 70 per cent; Puente District, 50 per cent increase over last year because of new orchards that will come into bearing; Whittier, about 85 per cent.

The work of identifying the nuts of the association will be continued this year by the continued use of cartons in which the nuts are retailed under the Diamond Brand. Last year 3,000,000 pounds were disposed of in this way but in 14½-ounce packages instead of pound cartons as will be done this year. A charge of one and a half cents per pound is made to cover additional cost of packing and shipping, but this is saved to the retailer in saving of breakage and labor.

Harvesting of nuts has commenced in some districts already, the crop being ten days to two weeks ahead of last year and expected to be of unusual quality.

BUR CLOVER IN PRUNES.

To the Editor: I enjoyed reading your article Aug. 12 on "Cover Crops" or green manure for fertilizer.

I have one-half acre that was not plowed last year and now the ground is covered with bur clover seed in the bur. I intend to sow it on some clay loam soil in the Sacramento Valley. I am sweeping it up and of course get a great deal of other seed and dirt with it. Will that make much difference? I am planning to sow it Labor Day. Is that too soon? How thick would you sow it? about how many burs to the square foot? Each bur contains four or five seeds. Would you harrow or cultivate it in or leave it on top? The land I will use it on was set out to prunes last spring. Would you sow the seed close to the tree or stay away a few feet?—H. R. H., East Oakland.

We would shake the bur clover burs in a basket in order to let them rise to the top of the dirt and heavier weed seed. This will avoid sowing a lot of stuff that you will not want on your land. However, the bur clover is a rank grower and would probably overcome most other weeds.

Labor Day is not too soon to sow it, if the seed bed is prepared—the finer the better. Ten or fifteen burs to the square foot should be enough, for it spreads considerably.

It would be best to cultivate it in, for unless you have irrigation it would be a couple of months before it can start, and it might as well have as good a chance as you can give it reasonably. It would probably not grow very tall this winter, but will make considerable growth early next spring.

Sow it all over the ground. If you are going to let it grow next summer you will injure your trees severely unless you give an extra amount of irrigation.

Suckers should be pulled from deciduous fruit trees in summer while it may be done quickly and before they have robbed the fruit wood.

We are more likely to get uniform horticultural laws if we insist on candidates pledging their support before we vote for them.

Mermaid Spray Powder

FOR CITRUS AND DECIDUOUS FRUIT TREES

ANALYSIS:—Curd Soap, 50%; Bicarbonate of Soda, 0.5%; Carbonate Soda, 37.5%. Balance Moisture.

FOR ALL ORCHARD PESTS.

SOAP SPRAY—An effective soap spray used in the proportion of one pound of powder to six or eight gallons of water with 200-pound pressure. Not harmful to trees or fruit if properly used.

ERADICATES SCALE.

MERMAID SPRAY POWDER will kill this form of pest when applied conscientiously with the above proportions at the right time. You will also note its effectiveness towards reducing red spider while spraying for scale.

COST—A cheaper and purer soap powder that is prepared with accuracy. Not the cheapest—but the powder that does the work.

UNIFORMITY—Guaranteed to be at all times uniform and without lumps and to dissolve with absolutely no waste, thus saving time and money by not having your spray machine stopped to clean out impurities.

IT WILL PAY YOU—to investigate Mermaid Spray Powder, and to use it, no matter how large or small your orchard.

WRITE US TODAY

We will cheerfully give reference from Professional Sprayers and Growers throughout Southern California who have tried all other Powders and have found **MERMAID SPRAY POWDER** without an equal.

"Spraying Makes Healthy Trees"

Squirrels and Wild Oats.

I have just read that the farmers in Ventura are trying to get rid of the ground squirrels by using steel traps. With sulphate of strychnia and saccharine on barley, I have killed every squirrel on my Santa Clara county ranch of 170 acres in three weeks, where half the place was literally crawling with them. Three times I was compelled to do this; as I do not live on the place, and am often away for six months at a time. The neighbors were careless and restocked me. Eventually the adjoining places went to work in earnest. They soon cleaned them all up and now we are all rid of them.

It takes a little time and stick-to-itiveness to do it. The main thing is to stay with the job. A man must put out the poison regularly and often, just as long as there are any squirrels to eat it. I put it out in plenty every other morning.

Take 20 pounds of good clean barley, one ounce of strychnia sulphate and one drachm of saccharine. Dissolve the strychnine in one pint of hot water together with the saccharine. Stir about one tablespoonful of cornstarch in a little cold water and be sure to get all the lumps out. Pour this into the water and stir and cook till you have a thin paste that will run freely. Pour this over the barley and stir until all the grains are coated. Stir every few minutes while cooling and drying to prevent lumping. It is ready to use. Where there is no stock to get it put about a teaspoonful in a place in their trails and near the holes. Where they are thick put plenty the first time and then put out regularly. Where the poison is still there it is sure evidence that the squirrels are all dead and no more is needed. Where it is gone put out more. Follow these instructions and the squirrels will all disappear.

Where there is stock throw a handful into the hole and it is a good idea to put a newspaper in the mouth of the hole after putting the poison in. Above all things do not cut down the amount of barley used—20 pounds to the ounce of strychnine. Too much strychnine makes the squirrel sick and he throws it up and will not eat any more.

Squirrels will carry off all the wild oats and large grass seeds on a range and that is why the fox tail is supposed to run the grass and oats out. Wild oats will hold their own against anything if they have half a chance.

In very sandy, loose soil every squirrel can be killed by running the hole full of the loose dirt and making a mound a foot or so high over it. The loose dirt runs in on the squirrel when he tries to dig out and fills the hole behind and in front and smothers him.

It is a shame that the supervisors of the several counties are not doing their duty in the matter of exterminating this expensive pest. In some of the counties they were almost extinct when the boards of supervisors stopped the work and all the money that was spent has practically been wasted. The squirrels are getting as thick as ever in many places; and it will take a large sum to do the work over. Why farmers will be so shortsighted and permit the squirrel to eat crops, I can not see. It costs so much less to kill them than it does to feed them.

I have written the enclosed to let those that really want to kill the pests know how to do it and how easy it is. If you think that there is anything in it that will be helpful to the fruit men and other ranchers you can probably write something that will take less space and be more readable. W. F. Chipman.

Wild Verbena---Knot Weed.

To the Editor: I am sending two weeds which I have numbered Nos. 1 and 2. They are taken from a new field of alfalfa sown this spring. There are great patches of No. 1 that grew as tall as the alfalfa and I think has crowded it out in spots; No. 2 not so bad. Kindly inform me if these weeds will winter-kill and if not what means best to employ to rid the field of them.—C. N. L., Visalia.

[Answered by Prof. P. B. Kennedy, Berkeley.]

No 1 is what is known as Common Vervain Verbena prostrata. These plants are particularly conspicuous at this time of the year because they are able to remain green while most other plants growing around them have dried up. The flowers en masse at a distance at least, look not unlike a patch of alfalfa. Stock do not seem to care for them at all, but I hardly consider them poisonous, just simply not palatable. The roots are perennial and quite hardy, so that it is not likely they would winter-kill. The plants are found along gravelly river banks and waste places throughout the country, and where abundant the seed could quite readily be carried by means of irrigation water to the alfalfa fields. It is not likely that the weed has spread over the entire area of your field, and therefore if you could sin-

gle out the patches, cutting that portion of the field even at the expense of some of the alfalfa before the plants go to seed, you would prevent further trouble from that score. Cutting the plants off well below the ground with a grub hoe, would, I believe, eradicate them as they are not pernicious weeds like morning glory and the like. Search in the neighborhood for the source of the pest along the ditch banks or the near-by streams and destroy the plants in that region so as to prevent their going to seed and giving further trouble. If the weed has taken a decided hold in your alfalfa, it would be necessary to replot the land thoroughly, secure a good seed bed and a strong stand of alfalfa, and you should have little further trouble. If an occasional plant should appear in the field, pull it up while the ground is soft, then plant young, and before it has taken a firm hold.

No. 2 is "knot weed," "goose weed," "wire grass," "wiry smart weed," "door weed," (Polygonum aviculare), for all these names are given to this common weedy plant found almost throughout the entire United States. Probably you need not give very much attention to this

Layne & Bowler PUMP

The Layne & Bowler Pump possesses a much wider range of capacity than other types of pumps. The most competent and well-known engineers and large irrigators throughout the United States highly endorse the Layne & Bowler Pump for it represents the highest development of water raising machinery in the world today.

Over 5000 Layne & Bowler Pumps in successful operation testify to their wonderful merits.

This type of pump has been recognized by pumping authorities as the type affording the greatest simplicity combined with the least investment for a given pumping capacity.

Our new Catalog No. 25 is fully illustrated and gives detailed information concerning this great pump. Write for it at once.

**Layne & Bowler
Corporation**
900 Santa Fe Ave.,
Los Angeles.

The KROGH Vertical Pumps

New Type Vertical.

Are automatically water balanced and require no adjustment of any kind. All weights of shafting and rotating parts are carried on the water film absolutely without the use of thrust bearings or adjustment of any kind.

No **BALANCE RINGS** or **PLATES** in KROGH PUMPS. They are unnecessary, and mean only continual trouble. KROGH PUMPS with the least number of parts means less friction and greater efficiency.

Get our Bulletin No. 78 before deciding on a pump.

plant. It would hardly be possible to eradicate it entirely when it seeds abundantly in every dooryard and street in the country. It is not likely to give you trouble unless the alfalfa should not receive proper moisture, or is over-pastured. In this event, the knot weed would be sure to become the aggressor and take advantage of the alfalfa and might crowd it out. In some parts of the country it is an annual and in others a perennial. In California it seems to act usually as a perennial. It is of account as a pasture plant, however, especially for sheep, as it has fair nutritive value. Cultivating the alfalfa crosswise and lengthwise will help to destroy the knot weed and encourage the alfalfa to a thicker and stronger growth, thus producing a dense shade which would crowd out the knot weed to a large extent.

[This knot weed is also of some value in pasturing horses, which take to it freely.—Eds.]

FLIES IN MANURE.

To the Editor: Please advise me as to the practicability of spraying stable manure with some chemical that will not injure the manure, yet will destroy the eggs or larvae of the house-fly. The manure is piled outside my barn, and its removal would be inconvenient for several months, because of the fact that all of my land is occupied by growing summer crops.—W. H. C., Lompoc.

[The U. S. Department of Agriculture recommends borax for this purpose. "Either 0.62 pound of borax or 0.75 pound of calcined colemanite (crude calcium borate) kills the maggots and prevents practically all of the flies breeding in 8 bushels of horse manure." Since the effects of this had not been thoroughly tried out on all crops, they recommended not over 15 tons of treated manure per acre as a rule. Sprinkle the borax or colemanite with a fine sieve mostly around the outer edges of the pile, and wet it with two or three gallons of water per 8 bushels. Then sprinkle a little on the daily additions to the pile. A number of stockmen are using gypsum to prevent flies. This adds fertilizer value to the manure and fixes the nitrogen so it is not evaporated.]

FARMERS IN PUBLIC AFFAIRS.

To the Editor: In your editorial of August 5, you mention that the farmer that understands his business and is equipped for farming, being better off than his city brother. I fully agree with you. There is a side to the farm that I should like to call your attention to, that means much to me viz.: freedom of thought and action. The city or town dweller has to be very careful in this respect. The people of Napa County will have a chance to vote for a new charter this fall. Derel Beard, a farmer, started the ball a rolling by going around to the different farm centers and talking new charter. D. J. Brown, also a farmer, a veteran of the civil war, fired the first gun in one of our local papers. Other farmers have since taken up the cudgels in its defense and are working for it. W. H. Murry, also a farmer, started a tax papers' association. There are at least a dozen farmers working for it. It has been a great success.

Napa.

Chas Blom.

John Deere Implements

John Deere Plows for Light Tractors

With High and Level
• Power Lift

PRACTICAL plows for the average farm. Work with any standard tractor.

Controlled by the man on the tractor. Pull the rope and all the bottoms raise high and level. Another pull lets them down.

Plows raised or lowered in fourteen inches ground travel. This makes square headlands.

All bottoms raise high—like a double-bail, high-lift horse plow. Plows do not clog or gather trash on the turn.

Extra wide and semi-floating front truck means uniform work and even depth of plowing.

Extra beam and bottom, readily attached, increases regular two-bottom plow to three or regular three-bottom to four, as desired.

Equipped with Quick Detachable Shares—save 80 per cent time changing shares.

Write for free booklet.

John Deere Spreader

The Spreader With The Beater On The Axle

BEATER drive works on the principle of a horse power. No clutches, no chains, no trouble. Mounting the beater on the axle (a patented feature) does away with half the types of castings.

Only hip-high to the top—but has big drive wheels. Wheels out of way when loading.

Here are three exclusive John Deere Spreader features—read them over and then be sure to see them on the spreader itself:

1. Beater on the axle—nothing else like it.
2. Revolving Rake—load moving back to beater revolves the rake. Draft actually less. Even spread certain—no bunching.
3. Ball Bearing Eccentric Apron Drive—requires no attention.

If you want to distribute manure seven feet wide, use the John Deere Wide Spread Attachment. Write for free booklet.

A Farm Book For The Asking

A Big One—168 Pages

Tells all about a complete line of farm implements and how to adjust and use many of them. A practical encyclopedia of farm implements. Worth dollars. This book sent free to every one who states what special implements he is interested in and asks for package No. X-152.

Mechanical Power on the Farm.

PUMP ON DESERT HOG RANCH.

[Written for Pacific Rural Press.]

What would hog raising on alfalfa in the desert be without a pump? Well, one or two pumps aren't enough on the Sierra Madre ranch in Antelope Valley, Los Angeles county. When we visited them in a snowstorm last March, they had nearly 300 hogs and 110 acres alfalfa including some recent sowings. They were fencing 240 acres, aiming to raise all their feed for the great purebred Berkshire herd which they had recently started with 40 head.

Alfalfa is pastured in small fields, 15 acres having been fenced for the purebred bunch. Twenty acres are in feterita, eight in sudan grass, and 14 in wheat and barley.

Antelope valley is a desert beginning to bloom with alfalfa, mostly in smaller acreages than that on the Sierra Madre ranch. To water the crops, only wells are available.

One well, equipped with a 20 h.p. gas engine and a Byron-Jackson centrifugal pump, supplies 120 inches of water which is run through nearly two miles of 12-inch pipe in four lines across the place. Half of the pipe are glazed tile, the other half concrete, and all are fitted with Kellar-Thomason valves, etc.

About 70 acres are irrigated from this pump, which runs night and day. The engine stopped while we were there on Thursday, for lack of gasoline. It had run without stop since the preceding Sunday.

The engine cools itself by pumping water through the cylinder jacket by means of a diminutive centrifugal. Its first explosion is set off with a match—a magneto supplies the spark for the rest. An emery stone is so placed that it also may be hitched to the engine.

Reservoir.—Since 120 inches cannot be handled all the time, a willow-bordered reservoir 200 feet square and five feet deep holds the output temporarily. The willows on this and the cottonwoods on two other reservoirs, not only beautify the desert landscape and furnish a landmark, but also bind the banks with their roots and break the soil-washing force of wind and wave.

An electric motor at the house well furnishes 30 inches for livestock, home use, and a surplus for irrigation of the small orchard, garden, and surrounding fields.

ORCHARD TRACTORS SATISFACTORY.

[Written for Pacific Rural Press.]

"If I were going to buy a new tractor for farm work, and didn't know any of the different makes, the first thing I would investigate would be flexibility in handling. In orchard work, a tractor should be able to make short turns," says one of the Boynton Bros. of San Jose, who have used three makes of tractors within seven years and now are using a Yuba 12 and Invincible 8.

"Tractors under 10 h.p. are not satisfactory in the long run for orchard work; and all orchard tractors should have a large steering wheel and independent wheel drive. The Yuba does all kinds of orchard work on 170 acres; the Invincible

is used on 45 acres; and some tractor road work is done.

Expenses.—"On the Yuba, we have found that we use 18 gallons distillate in 10 hours. Repairs cost more than we expected, but improvements are helping to lessen the upkeep cost. There was very little wearing out or breakage the first year. As for bearings, I think all reliable tractor companies are using the best materials at all points as fast as experience demonstrates what is best.

"We use six horses, to haul fruit, plow close to trees, haul out prunings, etc. Horsework is such a poor substitute for the tractor that we are sorry it is necessary to have a team.

HAS'N'T FOUND SATISFACTORY SMALL TRACTOR.

[Written for Pacific Rural Press by J. R. Johnson, Ontario.]

My experience with tractor engines is that unless you have a large piece of land the tractor will not pay as an investment. You must have a good man who understands how to operate a tractor of the particular make you may buy; and he is expensive. Also the wearing parts are too expensive for the small landholder. I believe that in the near future the small tractor will be more practical and cheaper, so it will pay to own one; but as yet the depreciation is too great.

For farming on a large scale where you can make the tractor take the place of 20 or more horses it will pay if you will get a good one that will not always be laid up for repairs when you want to use it. But for four to six horses, I believe the farmer will be better off to stay with his horses until the small tractor is improved and cheapened so the small farmer can afford to buy one.

Used Tractor Hard.—I have used a 30 h.p. tractor a little over one year. It has cost me for repairs \$600. I used it very hard. I plowed, made ditches, leveled land, ran a threshing machine, and did hauling with it. The expenses are not out of the way for the hard use we put it to.

AUTOMOBILE MOUNTAIN RULES.

(1) Drive slowly. Winding mountain roads are not valley boulevards.

(2) Blow your own horn. There are many places where an oncoming car is hidden in trees or around turns. A warning may save one or the other from backing to a passing place; and more important, may prevent an accident.

(3) Keep to the right on turns.

(4) Give the other fellow a little the best of every situation that arises. If a car is approaching, don't try to beat him past a passing place, but wait.

(5) Don't be a road hog. If a car capable of climbing faster than you overtakes you on a grade, give him the road. Expect and demand the same courtesy from one slower than you. Many mountain accidents result from disregard of this rule.

(6) Don't get excited. Most mountain roads of California are not narrow enough to be dangerous. The

Belting

That Must
Make Good

When you buy a rubber belt you should know what service it will give you or have the belt service guaranteed by a responsible firm who will make good in case the belt falls down. Every belt-buyer should know how to judge a rubber belt, and we would like to send you a free sample of **Test Special** together with our folder that will tell you just how to judge a rubber belt so that you may know just what service you will get from any belt you buy.

Fill out the coupon and mail it to us and we will recommend a belt that we will unqualifiedly guarantee to do your work satisfactorily. We have had seventy years' manufacturing and selling experience.

altitude and the steep descent at the side of the road mean slower driving, that's all. Hundreds of automobiles are driven with safety over these roads every week.

(7) Be sure your car is in good condition. Be sure that the brakes are adjusted evenly and the break-lining good.

(8) Never leave the car standing

with only the brakes to hold it. Shut off the power and mesh the low gear.

(9) Use the motor as a brake in descending grades. Mesh the gears in low and shut off the ignition. This cools the motor, saves the brakes, and prevents the driver from losing control of the car. Many mountain accidents are the result of burned-out brakes.

POWER NOTES.

State Fair Tractor Demonstration 9:30 a. m. to 1 p. m. Sept. 4.

The bean crop in Sutter basin depends on six big pumps which drain off the overflow water early in June.

Private tractor demonstrations every afternoon through the State Fair.

A tractor demonstration at the

Cal. Fruit Growers' Convention, Napa, Nov. 15-17, is planned.

Los Angeles Traction and Implement Dealers' Ass'n Second Annual Tractor Demonstration, Puente, five days, Sept. 19-23.

Twelve tons of grain per trip are reported to have been hauled by the Plaskett brothers to Yuba City by means of a tractor.

General Agricultural Review.

GRAINS AND FIELD CROPS.

Nevada farmers are harvesting a good wheat crop.

Ventura beans look as good or better than last year.

Minnesota and Dakota spring wheat has been severely affected by black rust.

Wheat has sold at \$2.05 and barley at \$1.56 in Monterey county, it is reported.

A Tulare county wheat crop of 1,200 sacks recently sold at \$2.01 per hundred.

The Stockton potato market has been easier because the growers are digging their crops.

A Merced barley grower recently received \$1.57 3-4 per cwt. on the ranch for 12,000 sacks.

Stockton is shipping grain to Europe as fast as cars can be obtained to ship it via New York.

Foothill tomatoes from Butte county are proposed for shipment to inter-mountain States by express.

The beet sugar factory of Glendale, Ariz., which was to be removed to San Diego, will go to Stockton for 1917 beets.

The Kern county rice crop is estimated at 50,000 sacks, averaging 20 sacks per acre on 2500 acres around Wasco.

Turlock Melon Day is to be celebrated Sept. 6 with parades, agricultural displays, etc. It has been a "million-dollar season."

Corn crops in the central southern States have suffered by drought but have improved in the Missouri, Ohio, and upper Mississippi valleys.

Tomato harvesting has started around San Leandro where a half crop is reported due to dry weather. Most growers do not have irrigation.

The U. S. Warehouse Act which became a law August 11, permits warehouses for grain, cotton, wool, etc., to issue uniform receipts which will be readily negotiable by reason of their uniformity and because the Government assures the correctness of grades, etc.

The newly elected directors of the Pacific Rice Growers' Ass'n have completely reorganized it and hope to market 80 per cent of the coming estimated 2,500,000-bag crop this season at 2 1/2 per cent commission. An appointee of the State Market Director is to be a member of the Executive Board.

DECIDUOUS FRUITS.

Contra Costa pear prices have been the best ever received, being up to \$3 per box net. Increased planting is expected.

Peach growers are advised by the Ass'n that they may deliver to whatever Ass'n packing house is most convenient, regardless of the recent postal card notices.

The San Diego Farm Bureau Aug. 5 discussed the provisions of a proposed law to keep bees off from fruit by removing the stands from the vicinity while fruit is ripe.

Peach growers who signed contracts with the Ass'n are reported to have sold on the tree or leased their orchards to outsiders. This will necessarily cause trouble, as it is urgent that all contracts be lived up to.

Opening prices made by the Cal. Peach Growers Inc. to the trade range from 5 1/4 cents for standard yellow, to 7 1/4 cents for extra fancy yellow and Muirs. Fancy peeled peaches are quoted at 9 cents. These prices are guaranteed against decline until Dec. 31, but not against a rise.

An effort is being made to scare apricot and prune growers into selling, by stating that the export market is demoralized by English seizures of dried fruit, selling it for army use at less than California prices and not turning back even that money. It is evident that the Britons appreciate our fruit and that when we are scared into not shipping any more for them to seize, they will come here to buy it, which is about as good.

W. H. Volck, Horticultural Commissioner of Santa Cruz county, reports about a normal apple crop for his district, Newtown Pippins being a little better crop as a whole than Bellflowers. Some apple mildew and woolly aphis has been experienced in the apple orchards this year but nothing unusual. The county apple grading ordinance is being enforced this year, all apples having to pass the maturity test before being loaded on the cars. Next year more

vigorous enforcement will be practiced through inspection of fruit before picking.

CITRUS NUTS, SEMI-TROPICAL.

Fresno fig packing companies tried to cut the wages of their packers, but a strike quickly brought most of them to terms.

Over 100 olive growers have signed with the new Cal. Associated Olive Growers, representing about \$100,000 subscriptions.

A Los Angeles county orchard inspector is defendant in a suit for attempting to force citrus growers to fumigate rather than spray.

Officers of the Cal. Associated Olive Growers are J. C. Martin, Jr., President; R. L. Underhill, Secretary and Manager; E. J. Harper and James Mills, vice presidents.

The Hillside Orange Ass'n of Tulare County has been holding Valencias on the trees for better markets than could be obtained in June when they are usually harvested.

The Central Lemon Ass'n of Orange county is paying its members \$40,000 for lemons picked between mid-April and mid-May. They were held in storage for the summer market.

Exports of walnuts from Grenoble, France, to the United States were in 1914, \$123,887 worth in shell and \$349,261 shelled; in 1915 greatly increased to \$269,488 in shell and \$508,488 shelled.

The Cal. Associated Olive Growers have asked permission of the State Corporation Commissioner to build processing plants in San Diego, Sacramento, and Butte counties. Local and State labels will be used on the product.

According to Horticultural Commissioner Carl Nicholls of San Luis Obispo county there will be in the neighborhood of 120,000 pounds of almonds harvested in that county this fall. The total acreage now planted to almonds there is given by him as 2761, and the present prospects are that between 2,000 and 3,000 acres will be planted next season. There were 1139 acres planted last spring.

GRAPES.

Subscriptions to the St. Helena Vintage Festival to Aug. 25 totaled over \$2300.

Labor Day at St. Helena will be celebrated with a big floral and industrial parade and band music.

Kings county plants of the Associated Raisin Co. will seed and pack over 500 tons of Fresno county raisins.

H. H. Harding of Fowler brought in a bunch of Thompsons which weighed 7 pounds 12 ounces. A still larger bunch of seedless grapes will be exhibited at the Fresno Fair.

Hard thunder showers around Reedley have been damaging drying raisins and alarming Malaga growers, according to H. H. Miller.

Malagas should test 18 per cent sugar before being shipped, according to Horticultural Commissioner F. P. Roullard of Fresno county.

Effects of last winter's experimental spraying for mealy bug on Kings county grapes are to be closely checked up during raisin drying this fall.

The 6000 acres of Sutter county grapes are threatened with phylloxera. Horticultural Commissioner Stabler is recommending resistant roots.

Tokay shot grapes must not be shipped this season from San Joaquin county, according to instructions issued by Horticultural Commissioner H. H. Ladd.

Malagas will start from Kings county about Sept. 10, according to Horticultural Commissioner F. K. Howard. Present cool weather is helping sugar content.

MISCELLANEOUS.

University of Nevada at Reno opened Aug. 28.

Interest on the \$18,000,000 road bond issue is \$784,572.

Fresno District Fair grounds are to be a garden of shrubbery and flowers this year.

The P. G. & E. expects to spend \$250,000 constructing tunnels, etc., to increase Placer county irrigation facilities.

Life is too short to pull or burn stumps

With \$5 worth of either of the Giant Farm Powders one man can

remove more stumps in five hours than he could pull or burn out in as many days. And a boy with a team can

clean up the pieces in another five hours. There's no way in which land can be cleared so easily, quickly and cheaply as by using one of the

GIANT FARM POWDERS

STUMPING — AGRICULTURAL

Eureka Stumping Powder is for dry work and Giant Stumping Powder is for blasting stumps in wet soils. These Giant Powders get out the small stumps at the lowest cost and save many dollars in blasting large stumps.

"I used eleven tons of your powders at Samuels, Idaho," writes H. F. Samuels. "The stumps removed were from eighteen inches to five feet in diameter. We had the very best satisfaction."

The Giant Farm Powders are made especially for blasting western stumps and for other farm work. Be sure you get the genuine.

Jackson MADE

For Water Deep Under The Ground

Jackson Deep Well Turbine Pumps give continuous and efficient service. They do not get out of order as they have no valves or plunger rods. Very little care or attention needed as they are oiled from the surface. Are much lower in cost than other types of deep well pumps when the expense of dug pits, cribbing and timbering is reckoned. They raise water from the very bottom of the well, thus eliminating heavy vacuums and delivering all the water the well yields. They develop slow wells and increase their flow.

Like all Jackson Made Pumps These Deep Well Turbine Pumps Are the Very Best Pumps Made for the Purpose—They are Dividend Earners, Not Expense Makers

Whatever your water problems may be our Expert Pumping Engineers will help you out free of charge—write

Publicity for Clean Milk Producers.

[Written for Pacific Rural Press.]

In view of the hard feelings which have existed for years between the producers of whole milk and the various civic organizations who have taken it upon themselves to stand between the producer and consumer in behalf of pure milk, it is gratifying to know that a seemingly fair standard has at last been put into practice by the city of Los Angeles for the scoring of market milk.

In the past it has been the practice to decide almost exclusively upon the bacteria count as to the quality of market milk. But beginning with the present year this method has been replaced by a milk score card furnished by the U. S. Department of Agriculture in which bacteria, flavor and odor, visible dirt, per cent of fat, solids not fat, acidity, bottle, and cap are all considered.

The method of procedure is to take samples twice a month from the wagon of each milk distributor, whether large or small. These are scored by the City Health Department for a period of four months, at the end of which time chemists from disinterested cities are called in to score each dairy's milk and compare such scorings with the previous ones.

The average result of these scorings for four months is then given out to the public press and given as wide publicity as possible, in order that those producing a clean milk may benefit financially, and thus encourage others to use better methods.

That the work may be fair to the various classes of milk put on the market, the scoring is done by classes, first the certified, then the special or guaranteed milk, next the pasteurized, and lastly the raw class.

All classes are scored by the same score card, however. The results of the first four months as recently published in the daily press indicated what has so long been thought by practicable dairymen, that the dairyman with a personal sense of cleanliness will produce good milk where another less particular person with a huge outlay of capital will fall down; for many of the raw class had scores equally high as the certified plants, contagious diseases not being considered.

The score card allows 35 points for bacteria count, 25 for flavor and odor, 10 for visible dirt, 10 for fat, 10 for solids not fat, 5 for acidity, and 5 for bottle and cap.

PRINCE BEAUTY PIETERSE SEGIS.

One of Frank M. Helm's Herd Sires. His Dam, Belle Segis, is a 31-lb. Daughter of King Segis. Many cows in Mr. Helm's Sale, Sept. 12th, Will Be Bred to This Famous Sire.

SHEEP FOR ALFALFA AND STUBBLE.

To the Editor: I am thinking of starting a small flock of sheep and would like to know which breed is most suited to my conditions here. I have 10 or 15 acres of alfalfa and 200 acres of stubble each year. I thought of getting about 50 or 75 good young ewes. Would expect to derive profit by selling the lambs and wool.—T. T. G., Merced.

Bishop Bros., San Ramon: I think any of the Down breeds are suitable for the small farmer. It is their natural environment. They have been produced by the small farmer to suit the needs of the small farm.

Of course to my idea the Shropshire is the best of them all. These sheep combine qualities of wool and mutton which are always in demand and the produce is always salable no matter how small the quantity.

Two other very important considerations where advantage must be taken of every available source of food, are, that they are very economical feeders, and that the lambs mature early and can be turned off in a short period of time.

Ewes of the Down breeds are scarce just now, so if they could not be found I would advise the subscriber to buy common Merino ewes

and breed them up with good Shropshire rams.

Peter Cook of Rio Vista: Get ewes with $\frac{3}{4}$ -blood Merino and $\frac{1}{4}$ Shropshire. Cross these with purebred Shropshire.

Prof. R. F. Miller, University Farm: Either the Shropshire or the Hampshire would be good. The Shropshire is somewhat smaller than the Hampshire but a little heavier shearing and somewhat more popular in this State. The Hampshire is coming to the front, however, and is liked somewhat better by some people, due to the larger size. They are both mutton breeds, have black faces and black legs and are well adapted to farm conditions.

TWO CROPS AND THREE PASTURINGS A YEAR.

[Written for Pacific Rural Press.]

What a little ingenuity can accomplish in the way of securing big yields is shown by the experience of Charles Olsen of Atwater on a small field of sandy loam soil.

Last January Mr. Olsen planted this field to barley; and on three different occasions he pastured it off, finally letting it head out, after which it was cut for hay in May.

About the first of June he irri-

High Record Cows and Heifers
Sons and Daughters of high-record cows.
Cows and Heifers bred to sires out of high-record dams,

offered for sale in the West as at this sale. Why not write for a catalog and see for yourself.

COL. BEN A. RHOADES,

1505 So. Main St.,

Los Angeles, Calif.

Solid Facts About

FRANK M. HELM'S FIRST ANNUAL SALE,
FRESNO, CALIF., TUESDAY, SEPT. 2, 1916.

Every animal in the sale will have passed a rigid physical examination as well as the Tuberculin Test and individual certificates signed by the State Veterinarian will be furnished with each animal.

Every one of the 60 females is a good individual. Many have very creditable records. All are capable of making big records. The females that are bred are bred to the two greatest KING SEGIS herd sires in the West, i. e., Crown Prince Segis being a son of King Segis and Beauty Pieterse Prince, being out of a daughter of King Segis. Can you estimate the value of calves from such sires? And there are seven daughters of Crown Prince Segis and three daughters of Beauty Pieterse Prince.

There are fifteen young bulls, everyone a real herd header and a perfect individual. Seven are sons of Crown Prince Segis. As an attraction I am selling my Junior Herd Sire

SEGIS PONTIAC MEAD.

He is a faultless individual, light in color and bred in the purple. His sire is from Riverside Sadie De Kol Burke, a World's Champion. The dam is a 20-lb. 2-year-old daughter of De Kol of Valley Mead and a granddaughter of Aralla De Kol, a world's champion.

This is the greatest opportunity Pacific Coast Buyers have ever had to buy this class of cattle. Why not write for a catalog?

gated the land and planted pump-
kins, getting a nice stand from
which he expected to secure a big
lot of good winter hog feed.

BERKSHIRES ON HOP AND
FRUIT RANCH.

[Written for Pacific Rural Press.]

Most purebred breeders are
graduates from grade livestock
classes. Such was the case of Frank
Brush, banker-farmer of Santa Rosa,
now the largest Berkshire breeder
in the northern coast district and
one of the largest in the West.

Mr. Brush made his start in the
hog business several years ago while
out on a pleasure trip, becoming in-
terested and finally purchasing a
grade sow and her litter that he saw
along the roadside.

These were put on one of his
ranches and when large enough the
pigs were sold at what seemed an
enormous profit. That led to other
purchases till finally several hundred
head of hogs were marketed an-
nually from the Brush ranches.

Six years ago he became interested
in purebreds and purchased a foun-
dation herd which has been enlarged
till at the present time there are
about 50 brood sows, including the
P. P. I. E. grand champion sow
Riverby Princess and several bought
at the Carruthers sale.

As herd sires, the boars Chalmer's
Duke 77th, third prize winner in the
aged boar class at the Exposition,
and Ames Rival 102nd are in use,
the nick of the latter boar on the
Chalmer's Duke pigs resulting in a
more refined looking Berkshire and
still maintaining the desired size
and bone.

With the increased size of the
herd came a necessity for special
swine quarters and these are now
located at the foot of a small hill
directly next to the orchard and hop
land located on the level below.

This hill is covered with brush,
making it a cool place in the summer
and providing some feed. Also it
develops good bone and feet in the
hogs.

Two small fields on the level land
raise feed for the hogs, and by pur-
chasing ground barley, middlings,
shorts, alfalfa meal, and tankage, a
satisfactory ration is made possible.

Because of his banking and other
farm interests, it is necessary for
Mr. Brush to have a competent
herdsman for his purebred herd, al-
though it is close enough to Santa
Rosa to allow him to keep in close
touch with all of the operations.

TWIN HEIFERS.

To the Editor: Would like to tell
A. H. H., Ukiah, that he had better
knock his twin heifers in the head.
We bought one of that variety and
it never would breed. This is a
dairy country, and have asked all
my friends on the subject and they
say twins are more liable not to
breed than they are to breed.

Point Arena. Jack Mounovan.

On the average about a carload of
horses are being shipped out of Han-
ford every week. Prices according
to James McCord are not as good as
they should be and as a result only
the poorer class of horses are being
moved. They are ranging from 1100
pounds upward.

GRANDSONS OF TILLY ALCARTRA

Prince Alcartra Korndyke,
Best bred son of Tilly Alcartra.

Our supply of these young sires is always limited, but we have a
few now which we are offering at very reasonable prices.

Write us at once, or call and see the herd.

[Livestock breeders all over the State are invited to send on postal cards, notes regarding their sales, State and County Fair intentions, new stock, etc.]

LIVESTOCK FAIR NOTES.

Yolo County Fair postponed indefinitely.

Nevada State Fair, Fallon, Sept. 11-16, instead of as previously announced.

Entries for the Stanislaus Livestock Show close Sept. 5. A four-day butterfat contest will be held.

The Cal. Hydraulic and Engineering Co. will have a complete exhibit of dairy equipment at the State Fair.

Solano County Fair at Dixon resulted in nearly \$6,000 receipts from all sources. Gate receipts were \$1813.

Fresno County Fair horse entries close Sept. 25. Prizes total over \$2200 besides gold medals in sweepstakes classes.

Alexander & Kellogg of Suisun won the silver cup for best cow any age or breed, at Solano County Fair on a Dairy Shorthorn.

A. L. Nelson of Cal. Polytechnic, San Luis Obispo, will judge horses, beef, and swine at Kings County Fair, Oct. 2-7, Hanford.

Remember the Farmers' Union livestock sale, and the Poland China sale, Modesto, Sept. 20, and the Duroc sale, Modesto, Sept. 22.

The Barco Ranch of San Benito county will be a new exhibitor at Sacramento this year in the Shorthorn classes, having fitted four head for that purpose.

Stanislaus Livestock Show and Exposition, Modesto, Sept. 18-23, will be held on and beside the baseball grounds on account of increased demand for exhibit space.

Kings County premium list, aside from race horse stakes, is \$5635 plus about \$2000 in special classes. About \$1000 worth of improvements are being made on grounds and buildings.

J. W. Marshall of Dixon won the trophies for best boar, best sow, and for best buck, any age or breed at Solano County Fair. Daley Bros. won the trophy for best ewe, any age or breed.

The hills back of Rio Vista furnish horses and mules for their Annual Horse Show Sept. 23; and the Sacramento River in front of town will be the scene of elaborate water festivities that evening.

The Pacheco Cattle Co., of San Benito county, will exhibit nine registered Shorthorns at the State Fair, according to Manager Chas. Hawkins. Norman Hale, the well-known herdsman, will have charge of the herd.

Contributions toward the Napa County Farm Bureau Fair Sept. 14-16 made previous to Aug. 25 totaled over \$1300 in amounts varying from 50 cents to \$50; with the County contributing \$300. The best livestock show ever held in the

county is expected. Free-for-all barbecue on Fair Grounds noon Sept. 16.

The South San Joaquin Second Annual Community Fair at Ripon Sept. 15-16 limits entries to products of southern San Joaquin County only. Feed will be provided free for all stock and poultry exhibited. Ribbons will be offered as prizes, though a premium list will be made and paid after the close of the Fair, principally from the receipts.

DAIRYING AND DAIRYMEN.

Modesto is to get a \$100,000 plant to be built by the Borden Condensed Milk Co.

A second cow-testing unit for the Glenn County Farm Bureau was proposed at a recent meeting.

The Lewis Co. of San Jose are erecting modern dairy buildings and silos on their ranch near Hollister.

The second Cow Testing Ass'n for Stanislaus county is planned; 930 cows were signed up over a week ago.

Frank Frazell of San Benito county now has a herd of about 30 registered Holsteins on his ranch where cheese is made.

At a big dairy cattle auction sale in Kings county recently, the milk cows brought \$37.50 to \$135 per head, averaging \$77.

The Hollister Creamery is churning between 550 and 600 pounds of cream daily. They pay on a grading basis, allowing two cents more a pound for A grade than for B.

Dairy Shorthorns and Poland Chinas were recently adopted as official livestock for Apache County, Arizona, by the Advisory Council of the County Farm Improvement Ass'n.

Six leading dairymen furnishing milk to San Francisco have furnished Market Director Weinstock figures which show that the net average farm cost of milk is 14.965 cents per gallon.

The Cal. Central Creameries Co. recently finished filling its U. S. Government contract for 700,000 pounds of butter. The last of it was shipped to the Brooklyn Navy Yard. Ferndale furnished 500,000 pounds.

Tulare Cow Testing Association records of over 60 pounds fat in 30 days ending Aug. 15, 1916, follow: W. J. Higdon, G., 68.78; E. H. Thompson, H., 67.03; C. G. McFarland, J., 64.41; E. H. Thompson, H., 60.45.

A certain Texas community is stocked almost entirely with cattle from its pioneer Jersey herd. Of 3832 head recently tested in this community for tuberculosis, only one reacted, and it had been brought from an outside district.

McAlister & Sons will furnish a certificate of tuberculin test with every animal sold at Rivera Sept.

LIVESTOCK DIRECTORY.

Rates in this directory, 3c per word each issue; or if carried weekly for one year, 2 1/2c per word.

SWINE.

Poland Chinas.

BIG TYPE POLAND CHINA HOGS—Bred sows, bred gilts, open gilts, weanlings, both sexes, boars ready for service. Herd sire, Iowa Wonder and Joker. Iowa Wonder is a son of "A Wonder," the greatest Poland-China boar living or dead. Joker was the First Prize boar in the Under Six Months Class at the Wisconsin State Fair in 1915. All animals are registered free of charge. Prices low on account of being overstocked. All animals first class. Quick, easy feeders, the kind the farmer wants. As a special premium each purchaser will be given a year's subscription to the "American Swineherd," the special advocate of the Poland-China, and a copy of "The Handbook on the Sow" and "The Pig Feeders' Manual." Write Geo. A. Smith, Corcoran, Cal.

YOUNG POLAND CHINAS, LARGE TYPE—Boar IBA Wonder won first and Reserve Championship P. P. I. E., weighing 730 pounds under 2 years and in breeding condition. 60-day special—fine young sows bred to IBA Wonder at very low prices; also weanling pigs, either sex. Satisfaction, or money refunded. W. A. Young, Lodi, Cal.

LAKEVIEW STOCK FARM POLAND CHINAS are money-makers. Satisfaction or money refunded. Geo. V. Beckman & Sons, Lodi, Cal.

POLAND CHINAS—Young stock; either sex. Write for pedigree. Reasonable prices. Edw. A. Hall Watsonville, Cal.

19-20. Animals under six months may be left free of charge and tested when that age. Every animal is guaranteed to be a breeder.

The Western Meat Co. of San Francisco is putting up a \$125,000 building at the Stockyards to use as a curing, freezing, and cooler room for meat, butter, and eggs. It includes a new ice machine besides their old one.

SWINE BREEDERS AND STOCK.

Fifty-four carloads of hogs were shipped from Hanford since Aug. 10 according to the Hanford Journal.

The University will keep cholera virus and serum in cold storage with Imperial County Farm Adviser P. I. Dougherty.

The semi-annual meeting of the Cal. Swine Breeders' Ass'n will be held at Hanford on "Swine Day," during Fair week.

N. W. Belleville of Glenn county suggests covering the Willows railroad corral to prevent hog shrinkage on winter shipments.

A. B. Humphrey of San Joaquin county and W. S. Guilford of Glenn county recently bought Berkshires at the Gregory Farms sale.

A large new hog shed is being built at the California Polytechnical School at San Luis Obispo, having concrete floors and feeding pens.

Peters, Lamson, and Walker of San Bernardino county will show at the Riverside Fair and participate in a combination purebred sale after the judging.

Hogs fed all the corn or wheat they want make more rapid gains if fed tankage, also, than if tankage is omitted. Whether these gains are more economical depends on the grade and price of the tankage.

Dallas Basche of San Benito county is establishing a choice herd of Berkshires on his ranch near Hollister, having recently purchased a son of Grand Leader 2nd from Grapewild Farms and a very choice young sow from Carruthers' Farms.

Hogs fed corn, wheat, and tankage in varying rations at the Missouri College of Agriculture for 120 days showed better gains for wheat than for corn and better for either with tankage than for either without it.

Chas. Hanna of Gilroy, who grows purebred Poland China hogs in connection with his young orchards, has 65 head at present, of which 11 are mature brood sows. Mr. Hanna grows horse beans, pumpkins, and Indian corn between the rows of his young trees for his hogs. He also has alfalfa pasture.

Carson Valley, Nevada, has the only Hampshire swine herd in the western part of the State. Their owner is C. H. Springmeyer, who has about 100, headed by Minden Chief, purchased from W. Henderson of Berkeley. He was sired by Gen. Allen and out of Tahoe. The average litter has been 9 pigs.

The Poland China sale to be held at Modesto Sept. 20 during the Stanislaus Livestock Show, will include 6 boars and 35 gilts, yearling sows, and two-year sows, of large medium, and small types. Prof. J. I. Thompson of University Farm selected them from the owners' herds. Several will be shown at the State Fair.

Duroc Jerseys to be sold at the Modesto Fair Sept. 22 will include 5 males, 35 spring and fall gilts, and a few sows. Some of these will have been at the State Fair and all will be exhibited at Stanislaus Livestock Show. Prof. J. I. Thompson of University Farm visited the herds Aug. 22 and selected the consignment.

GENERAL LIVESTOCK NOTES.

Kern County sheep men have been paying \$10 per acre for alfalfa to pasture from August to the end of the season.

Joe Corey of Kings County, buying mules for the U. S. Army, predicts a shortage of big ones within two or three years.

Oregon capitalists have bought the Marysville woolen mill which has been closed 17 years. Bishop Bros. are behind the new company.

Dr. Polin of San Luis Obispo county is erecting a silo and other modern dairy buildings on his ranch. He has lately acquired a small herd of registered Holsteins with the intention of eventually having a large number of bulls to dispose of in the adjacent territory each year.

WATERS, FEEDS, DAIRY

Dairy Replaces Famous Vineyard.

[Written for Pacific Rural Press.]

The transformation of one of the most famous wine-making establishments in the State into one of the finest dairy establishments in the west is the interesting work now in progress on the former Linda Vista Vineyard, now known as the Stephens Dairy, located close to Mission San Jose in Alameda county.

The dairy barn and milk house which have been constructed are the last word in sanitation and convenience, being built of concrete throughout and located on a hillside so that perfect drainage is secured. They fully meet the requirements of the certified milk specifications, but certified milk is not being sold.

The barn has a capacity of 120 cows, being 210 feet long and 40 feet wide. Two 20x30-foot silos at one end will be filled with corn from 110 acres of corn planted this year.

Of the 1106 acres in the ranch, 100 are planted to fruit, the balance

being farmed to general crops and alfalfa. With the development of the dairy will naturally come a larger acreage of forage crops. Experiments made with Sudan grass last year and this indicate that this crop can be successfully and economically grown on the ranch for pasture, hay, and silage.

As the hill on which the buildings are located is underlaid with a large number of springs, many of which flow during the entire year, a concrete dam has been constructed across a small gully, by which water storage is made possible for summer irrigation of alfalfa.

At the present time, 140 cows are being milked, which number will be increased as soon as the feed supply will warrant it. Because of its nearness to the bay cities, the ranch is admirably situated for the production of whole milk, which is the practice at this time.

Napa Pig Club Winner Gives Details.

[Written for Pacific Rural Press]

In the Pig Contest of the Napa high school, which just closed, the winning pigs, owned by George Gosling, made a gain of two pounds a day for five months. The following essay, one of the requirements of the Contest, is the winner's own story of how he raised his pigs:

How I Raised My Pigs.—"When I decided to enter the pig contest the first thing I did was to consider the most desirable breed. After consulting my father, who has had some experience in hog raising and who

alfalfa which was steadily increased. This feed alone was fed for the first two months, giving them all they would properly clean up. At the end of this time tankage was added to the ration. This was put in a separate box and kept before them continually until fattening time which started at the age of five and a half months. At this time soaked corn was gradually added to the ration, and the tankage and pasture was discontinued. From this time until the end of the contest, corn and

Napa High School Prize Pigs and the Winner. The Young Men Will Continue Raising Purebreds.

greatly favored the Poland Chinas, this was the breed selected. I then began to look for some of the best pigs of this breed as I intend to continue raising Poland Chinas after the contest is over. I wrote to many of the most prominent breeders, telling them what the pigs were for, and received very favorable answers from all. The best of these I considered was from W. A. Young of Lodi, whose offer I gladly accepted. These were sent to me at the age of two months, directly from their mother. He did not have time to wean them as I had to have them at this age to enter the contest. Through Mr. Young's advice I started right in to feed them rolled barley soaked in sour milk. The fourth day I began giving them green al-

rolled barley soaked in milk was fed. They were given a cool wallow hole; and lots of fresh water was given them. Under these conditions and feed the pigs did very well, making a gain of three pounds each per day. During the entire contest charcoal, wood ashes, and salt were kept before them. The first 3½ months the pigs were given plenty of exercise; the last month and a half they were enclosed in a small pen. Several times during the contest the pigs were washed in sheep dip to keep them free from lice. The pen was kept as clean as possible and the pigs did nothing but eat and grow."

Miller and Lux have contracted for over 20 reinforced concrete silos for their San Joaquin valley ranches.

FREE

to all owners of cows

If you keep cows you ought to write for this book

THIS book was written for the man with only two cows just as much as for the man with twenty. In it has been gathered together a great fund of valuable information on subjects which are of vital interest to every cow owner. And while the various phases of dairying are treated by the best and highest authorities, it is not a technical treatise but is written in plain every-day language so that even the children can understand it. Here are just a few topics that will give you an idea of the practical nature of its contents:

"How a Dairyman Made Good"—a real story of a real farmer, who started with almost nothing, built up a fine dairy herd and made a big success.

"Year Around Feeding of Dairy Cows"—by an authority whose advice is well worth heeding. The importance of proper feeding deserves more attention from every cow owner.

"How to Judge a Dairy Cow."—shows by illustrations what points to look for in a dairy producer—explains the essential qualifications of a good dairy cow.

"Building Up a Dairy Herd"—a practical breeder gives some sound advice on this important subject.

"The Farm that Won't Wear Out"—shows that the farm where cows are kept, and the fertility returned to the soil, improves instead of deteriorates.

"The Care of Cream on the Farm"—quality is as important as quantity. It costs little and brings big returns.

"Silos and Silage"—one of the best chapters in the book. Full of silage facts that every farmer ought to know.

Then there are splendid articles on "Alfalfa," "Ventilation of Dairy Barns," "Breeds of Dairy Cattle," "Improving the Herd with a Good Bull," "Care of Freshening Cows," "How to Test Cows," etc. Numerous dairy rations, suitable for various sections of the country, are given, and various milk and dairy tables as well as tables of weights and measures, silo capacities, etc. that every farmer has occasion, at some time or other, to refer to.

Thousands of dollars have been spent in the preparation of this book, and if you keep cows you certainly ought to write for a copy and read it from cover to cover. The book is absolutely free. Just fill out the coupon or send the information requested on a post card, mentioning this paper.

A CALF NURSERY.

[Written for Pacific Rural Press.]

Calf-raising is one of the important considerations on the Escalon branch of Grapewild Farms because it is the belief of A. B. Humphrey, owner of the ranch, that the value of a cow depends largely on the manner she is cared for as a calf.

On this ranch a calf nursery is maintained through which every calf must pass before being turned onto pasture. This nursery is an addition to one of the feed barns, being enclosed on all sides and overhead but well ventilated and lighted.

The nursery is divided into four pens, all of which open into outdoor runways. Pen number one is for the calves directly after being born. Here they are allowed to suckle cows, kept especially for that purpose, for two or three weeks. After this they are gradually put onto skim milk and grain.

In pen number two the milk is cut down gradually and some hay provided. By the time they have gotten to the right size for pen number three they are on a grain and alfalfa ration entirely.

In the fourth pen they are also fed alfalfa hay and grain, but the latter is gradually reduced here, and when they finally leave this pen they are good growthy animals, in suitable condition to turn onto good pasture.

VIGOROUS SIRE NEEDED.

[Written for Pacific Rural Press.]

Does pampering the dairy bull make him a less vigorous and sure breeding animal? It is the opinion of F. Stenzel of San Leandro that it does; and because of that belief, his purebred Holstein bulls are not handled more than necessary, nor are they kept housed up and fed a lot of rich concentrated feeds.

They are turned into pastures by themselves, away from all of the females in the herd, where they are exposed to the weather, and fed pasture with a small amount of mill feed.

As a result of this system, every bull raised on the place for the past five years has been strong and vigorous and well able to take care of himself under the most adverse conditions that can be found on California dairies.

Quite the contrary to this was the experience of Mr. Stenzel in purchasing a bull for use on his own herd. This bull had been abundantly fed in a box stall in the East before shipment and upon arrival was sleek and fat enough for the show ring. But after repeated attempts to get cows in calf to him during a six months period he had to be finally replaced with another bull combining more stamina with his good breeding.

The first issue of the Imperial County Farm Bureau Monthly Sept. 1916 contains an article advising chloroform for calves which exhibit lung worm symptoms by hard coughing in early stages, softer coughing later, frothing at the mouth, necks extended, and rapid loss of flesh. The chloroformed worms are expelled by coughing, swallowing, and use of a purgative two hours after giving chloroform. Calves must be given only enough of the anaesthetic, through the nostrils, to make them act dozey.

REMCO

Air-Dried Redwood

PIPE

For Irrigation—Water Supply—Power. Sizes 2 inches to 12 feet. For pressures up to 400 feet head. Guaranteed for 100 per cent overload.

Costs less than any other pipe of equal capacity, efficiency and endurance.

Not affected by worms or insects, acid or alkaline soils, electrolysis or roots.

Withstands extremes of heat and cold, dryness and moisture.

Outlasts any pipe except cast iron, and maintains its full flow capacity to the end.

TANKS

for Water—Wine—Vinegar—Oil—Acids—Solutions. For Storage—Mixing—Fermenting—Pickling—Leaching. In all shapes and sizes—500 gals. to 500,000 gals.

SILOS

for Dairymen—Stockmen—Feeders. Sizes, 25 tons to 300 tons. THE BEST.

ALL REMCO PRODUCTS are manufactured to your order from CLEAR, AIR-DRIED REDWOOD.

Selected from our stock of forty million feet.

Their outstanding features are HIGHEST GRADE MATERIAL—MECHANICAL PERFECTION—SUPERIOR EFFICIENCY and MAXIMUM DURABILITY. Catalog sent on request.

Three Hundred Million Bushel Crop in 1915

Farmers pay for their land with one year's crop and prosperity was never so great.

Regarding Western Canada as a grain producer, a prominent business man says: "Canada's position today is sounder than ever. There is more wheat, more oats, more grain for feed, 20% more cattle than last year and more hogs. The war market in Europe needs our surplus. As for the wheat crop, it is marvelous and a monument of strength for business confidence to build upon, exceeding the most optimistic predictions."

Wheat averaged in 1915 over 25 bushels per acre
Oats averaged in 1915 over 45 bushels per acre
Barley averaged in 1915 over 40 bushels per acre
Prices are high, markets convenient, excellent land low in price either improved or otherwise, ranging from \$12 to \$30 per acre. Free homestead lands are plentiful and not far from railway lines and convenient to good schools and churches. The climate is healthful. There is no war tax on land, nor is there any conscription. For complete information as to best locations for settlement, reduced railroad rates and descriptive illustrated pamphlet, address
Superintendent of Immigration, Ottawa, Canada, or apply to Gilbert Roche, Canadian Government Agent, Canadian Bldg., Exhibition Grounds, San Diego, Cal.

Canadian Government Agent.

Raising Poultry for Profit

SELECTING AND HOUSING HENS FOR WINTER EGGS.

[Written for Pacific Rural Press by Susan Swaysgood, Pomona.]

The person with a judgment for chickens can select the good laying hen now without waiting for the trap-nest. There are four points that nearly everybody can detect, namely, indications of sex development by the head, which is round and fine rather than long, eye alert and quick to notice, beak rather short; the pelvic bones must give room for the passage of eggs; if narrow and bones are crooked the hen will not be a heavy layer; vigor and good respiration always go with good layers; they must have a good appetite and capacity to digest and use the food eaten. A poor layer is never a big eater; she stands on the fringe of the flock at feeding time and picks food as if looking for dainties. Beware of the dainty hen; she is not worth the salt to season the feed you give her. To select pullets requires better judgment than to select hens, because it may be that one you would condemn as worthless might simply be a trifle less undeveloped than the rest, and time will change that.

Next to having the right hen for winter egg production, comes housing.

The Right House.—The right house for California, any section, must be open front without any fancy trimming by way of curtains. Leave the curtains for colder countries—they probably need them, but positively we do not. No matter where you live, place your houses with back to the storm direction; never have them so that rain and wind beat in on the fowls. It was wrong placing of poultry houses that led to closed houses, the most unhealthy thing for chickens of any age or kind. After placing the houses back to storm direction, comes the idea of depth, or width. I know several people that have real good houses, apparently; that means they are built of good lumber, placed right and have good roofs on; but are built long and narrow from front to back. In this case the wind whips around the ends of the building and causes a draft on the chickens as they roost. If the house had been two to four feet deeper, the roosts would have gotten the benefit of the

fresh air without the draft.

Drafts cause all sorts of catarrhal colds, roup, and sometimes pneumonia, because when a hen is on the roost her circulation is not as active as when on foot. So let the perches be at least six or eight feet from the front of the house. If you do this you will have no colds, no roup, pneumonia, or bronchitis—in fact all these things come from the one cause. But don't forget that your house must have a roof no matter where else it falls short.

QUESTIONS AND ANSWERS.

[Written for Pacific Rural Press by Susan Swaysgood, Pomona.]

Chicks Lose Feathers.—I hatched 125 Rhode Island Red chicks June 1, and have fed them the same as all other chicks I have hatched. They seem to lose all their feathers. Some have no feathers at all, but all seem healthy.—A. F. S.

The R. I. R. do not grow feathers as quickly as the small breeds like Leghorns. Sometimes one or two chicks will be almost nude, just growing a few wing feathers; then all at once they commence to feather and are generally among the nicest chicks. If your brooder was kept too hot that would account for it, but I have seen the same thing occur in hen-raised chicks, the heat from the hen's body proving too strong for the feathering. There is no disease and nothing can be done except to see that the chicks do not over-crowd. Keep their quarters clean.

Hens Stagger and Hang Wings.—One or two of my chickens have died. They are fed sprouted oats for morning feed. Egyptian corn and wheat at night, and a good mash before them all the time as well as grit, charcoal, etc. Their combs get dark red or bluish, they stagger and droop wings, are very thirsty and in two or three days they die.—J. G. A.

Your hens have inflammation of the liver. The best thing you can do is to cut out some of the mash, mix it with chopped alfalfa or clover and feed a certain amount each day. Don't leave it before them all the time. Put a little sulphate of magnesia in the drinking water for several days to clear out the bowels and regulate the feed. It is a case of too much mash.

Pullet Feed for Development.—Have about 300 pullets four and five months old; have plenty of green feed and twenty gallons skimmed milk a day. Would like to know the proper grain ration to feed.—J. E. B., Modesto.

You are a lucky man: plenty of green feed and milk; now if you will give those pullets one good meal of sprouted oats or barley a day, say in the morning,—it is easy to digest, so give them all they want—then let them have wheat and gyp corn in hoppers to run at all day whenever they feel like it, those pullets will pay you back in coin of the realm in a month or six weeks' time. Just be as generous with the grain as you can be and you will not hurt them no matter how generous you are. Don't stint them to any certain amount; if you do they will not develop near as soon nor lay near so well.

WINCHESTER

HAMMERLESS SHOTGUNS

MODEL 1912

Extra Light Weight

Made in 12, 16 and 20 Gauges

There's no need of carrying a heavy gun. The use of Nickel Steel makes it possible to get extreme light weight with great strength. But it costs more, and so is not generally used. Winchester Model 1912 shot-guns are constructed entirely of nickel steel, which makes it the lightest and strongest gun on the market. It is very handsome besides, and a reliable, fine-shooting gun. Be sure to see one before buying. Sold by all dealers.

THE REPEATER PAR EXCELLENCE

Keep Their Houses Clean

Mites and lice breed by the millions these early fall days. Don't let them get a foothold in your growing flock—the birds you expect to lay high-priced eggs this winter. Make their houses bright cheerful and sanitary and prevent the existence of all vermin and disease germs by painting and disinfecting at one operation with

CARBOLA

A snow-white mineral paint combined with the world's most powerful germicide. Rids the premises of vermin, yet cannot harm the birds. Comes in powder form. Mix with water and it is ready to use. Can be put onto any surface with brush or sprayer.

Use It Instead of Whitewash

in poultry houses, dairies, barns, cellars and piggeries. Will not blister, flake or peel. Used and endorsed by experiment stations and many of the largest poultry and dairy farms.
10 lbs. (10 gals.) for \$1 plus postage. 20 lbs. (20 gals.) for \$2 delivered free. 50 lbs. (50 gals.) for \$4 delivered free.

WESTERN YALOW CO.
SAN FRANCISCO
ABSOLUTELY NO FISH FLAVOR

Turks Have Swelled Heads.—Have 30 young turks two to three months old. About two weeks ago half of them began running at the nose and a few days later swelling around the eyes. They eat hearty but do not forage much. They have well-ventilated coops, kept clean by spraying. Feed plenty of greens, lettuce, onions, cabbage, kale mixed with ground grains, feed plenty of whole wheat. We have 640 acres for range. Have used coal oil and lard on the heads, wiping it off; also used peroxide half and half. Gave permanganate of potash in water, but see no improvement.—R. S. U.

Turn your coops over and let the turks roost on top, cut out the feed and let them rustle. Turks two to three months old don't need coops; and a very little feed, night and morning, is enough. Put the coal oil on top of the drinking water so that every time they get a drink the oil cleanses the nostrils. Dosing will do little good now. It is too late. Let nature try.

POULTRY ITEMS.

Fresno county has a co-operative non-profit poultry association organized last May.

About 175 tons of chickens and 361 tons of turkeys were shipped out of Imperial Valley by express during the past 12 months.

The Oregon Agricultural College pen of hens at the Storrs (Conn.) Egg Laying Contest laid 61 eggs in the week ending Aug. 5, being the best pen record that week.

How to feed hens is to be taught in a six-weeks Short Course in Poultry to be given by the University of California at the University Farm, Davis, October 2 to November 14, short courses being in progress at the same time in Agriculture, Horticulture, and Dairy Manufactures.

Poultry Breeders' Directory.

RAISING FALL CHICKS PAYS.—If you know how. Write for particulars and our circular and prices, for it will interest you. Barred Rocks, Rhode Island Reds, Black Minorcas, White, Brown Leghorns—any quantity. Our breeding stock is in fine condition, and our hatching and shipping facilities are the best. We quote express-paid prices on request. Roodeen Poultry Ranch and Hatchery, Campbell, Cal.

BARRED PLYMOUTH ROCKS.—"The kind that Wins and Lays." Eggs for hatching and choice stock for sale. Have bred Barred Rocks for over nineteen years exclusively. Write for catalog showing winnings at California's leading shows. Chas. H. Vadden, Box 396, Los Gatos, Cal.

MAKE AN EARLY START with your Fall chicks and get them right now. We have Baby chicks as well as chicks one and two weeks old with price same as baby chicks. No weak ones. All strong chicks—all varieties. Santa Clara Valley Hatchery, San Jose, Cal.

PIGEONS AND TURKEYS ON SIX ACRES.

[Written for Pacific Rural Press by Bert S. Wolf.]

Purebred pigeons and turkeys on six acres have proved profitable for W. T. Kestell of Reno, Nevada. Mr. Kestell began breeding fancy pigeons in England more than 20 years ago; but has been in this country many years and has as lovely a collection of birds as the writer ever saw. They are Drogoon, Fantail, and English Pouters.

One of the carriers recently flew

from Virginia City to Reno in 20 minutes.

The Kestells have a collection of medals and blue ribbons won in Fairs even so far away as New Jersey; and many have been won in California at Sacramento and P. P. I. E. His birds won sweepstakes at Nevada State Fair a few years ago.

Turkeys.—In spite of wind and cold Mr. Kestell has now about 500 Mammoth Bronze turkeys. Three of these weighed 105 pounds.

All eggs are hatched by hens. In the past year 97½ per cent of

them were hatched and 90% raised. **Nests for Sitting.**—The turkey house is 80 feet long and contains 30 separated nests. Each one has a hinged cover so the sitting birds can get out 15 minutes at a time each day. The front of each nest is covered with a locked picket gate. Six inches of sand are used for the eggs to lie on.

Feed consists largely of two panfuls of grit, two handfuls of fine oyster shells to three gallons of bran mash once per day and frequent feeds of greens and grit.

26 Extra Features

MID-YEAR MODEL

73 New Conceptions

A Better Type of Car

The Result of 700 Improvements Made by John W. Bate

We ask you to see—for your own sake—a car vastly different from others. A car built by John W. Bate, the efficiency engineer, after 13 years of constant betterment.

We brought John W. Bate to the Mitchell plant to work out a lifetime car. And to build a plant and equip it so such a car could be built at the lowest cost.

He has built that plant—a model factory. It has cut our factory costs in two. And he has built the car. This Mid-Year Mitchell—his 17th model—shows the final result of his efforts. It shows the result of 700 improvements made since he started with us.

Don't make the mistake of buying a fine car without knowing this Bate-built type.

Every Part Perfected

Every part in this Mid-Year Mitchell has been studied, tested and revised until Mr. Bate pronounced it perfect.

The car is almost without castings. There are 440 parts—drop forged or steel stamped—which are three times as strong as castings.

In every part at least 50 per cent is added to the needed strength.

All important parts are oversize. The parts which meet the major strains are of Chrome-Vanadium steel. No Bate cantilever spring—which we use—has ever yet been broken.

The result seems to be a lifetime car—what Mr. Bate has aimed at. Six of these Bate-built cars have averaged

164,372 miles each—over 30 years of ordinary service. One has run 218,734 miles.

26 Extras—73 New Ideas

The next step was to make this a complete car—a car with every wanted feature. This Mid-Year Mitchell has 26 extras, all of which most other cars omit. Each is something you will want.

Then we combine in this one car all the new ideas and touches. In designing this model our experts examined 257 new models. This model embodies 73 new conceptions, all of which add beauty, luxury, comfort or convenience. So you will find in this Mitchell the most complete car built. And you will find all the new ideas.

No Extra Cost

The result is a car of wondrous endurance, a car of low upkeep, an almost trouble-proof car. It is the car which great engineers are buying. Your dealer will show you a list of them.

The extras alone—things other cars omit—will cost us this season over \$2,000,000.

Such a car at the Mitchell price would be impossible, save for our factory efficiency. About 98 per cent of this car is built in this plant, under Mr. Bate's efficiency methods. And all those savings go into extra value.

If you don't know the nearest Mitchell dealer, ask us his name. Let him show you all that John W. Bate has done. It will win your admiration.

THE HOME CIRCLE PAGE

IT'S ANONYMOUS.

The socks I darn for thee, dear heart
Mean quite a pile of work for me;
I count them over every one apart,
Thy hosiery;
Each sock a mate, two mates a pair,
To clothe thy feet in storm and
cold,
I count each sock unto the end, and
find
I've skipped a hole.
O carelessness, this is thy reproof;
See how it looms across thy sole;
I grind my teeth, and then in very
truth
I darn that hole, sweetheart,
I darn that hole!

'MANDA JANE.

None of us liked Manda Jane. We all said so the first day she came to school. Her dress was sort of old-fashioned, and too long for her; but it wasn't just how she looked that was the matter. I guess we thought there were enough of us without her, and we didn't want any more. You see, there were nine of us girls who brought our dinners,—just enough for the three playhouses out under the 'roop' and, besides, we all knew each other, and it's so much trouble to get acquainted with strangers.

"Well, we don't need to have her," said Delia Kelly. "We didn't ask her to come to our school, and we can go on just the same as if she wasn't here."

So when noontime came, and the teacher and the other little children went home, we hurried off and left 'Manda Jane to herself. She looked up as if she expected we'd ask her to come, too; but we didn't, and after a few minutes she sat down on the steps and opened her basket. She sat there nearly all noontime, and we couldn't help seeing her while we played. Little Kitty—she's always so tender-hearted—wanted to ask her to come.

"Whose playhouse can she have a part of, then?" asked Marie. "There are only three places, and it'll make one of 'em all crowded up to have four girls in it."

Well, none of us wanted her; and Kitty couldn't do anything without the rest of us, though she looked sorry. That's the way it went for four or five days. We found 'Manda Jane knew as much about her lessons as any of us, though her dresses were too long, and the other children liked her in games at recess; but we girls wouldn't pay her any attention. Our schoolhouse is in the country, in a nice woody place; and so we thought 'Manda Jane was going to look for wild flowers when she didn't stop on the steps one day, but walked right past where we were, farther in the grove. By and by we saw her moving about as busy as she could be, as if she was making a playhouse all by herself.

"I think that would be awfully lonesome," said Kitty; and I think we all felt a little sorry and sort of mean, only we wouldn't say so.

The next day 'Manda Jane hurried off just the same way, and the day after that, too; and we could see her flying about and fixing something. We pretended we didn't care what it

was; but, really, we could hardly play at all for watching her. But the next noon, when we were getting ready to go for our baskets, she stopped us.

"There's a new store started down near where you folks keep house," she said; "and, if you want tea, sugar, soap, or—or anything, the woman that keeps it'll give good measure and sell cheap."

"Store?" we all said at once.

She was leaning against the teacher's table, her eyes all twinkly and laughing; and she looked almost pretty,—ever so much prettier than Marie, who jumped up on the table beside her.

"Yes, I've started a store," she said, "and I should think you housekeepers would need to buy lots of things."

We began to crowd round her; but she wouldn't tell us much, only to "come and see," and we didn't wait to have her ask us twice. She had fixed up the prettiest place with moss and green branches!

There was a nice, smooth stump for a counter, and scales made of strings and birch bark. There was white sand for sugar and pebbles for coffee, and she had made, cunning little paper bags to put things in. Oh, it was such fun! We bought and

bought; and she gave us some real gingerbread—such good gingerbread that her grandmother made,—because, she said, storekeepers gave things when they had an "opening." We forgot all about not wanting her, and almost forgot to play house at all, because we were all the time running to the store. She had so much custom that she said one of us might be a clerk; but everybody spoke for the place, and so we had to take turns. It was the very nicest noontime we had, and nobody ever thought of leaving 'Manda Jane out after that: we couldn't do without her.

"How did you ever come to think of anything like that?" Delia asked her one day.

"Grandma made me think of it," she said. "You see, I felt a little bit lonesome, and I thought"—her face grew red and sober, and she stopped a minute; then she said the words right out—"I thought you girls didn't like me, and wouldn't ever be friends; and I told grandma there wasn't any place for me. 'Make a place, then,' she said. 'All the world wants the ones that are willing to make themselves wanted.' So then I stopped thinking how you ought to make it pleasanter for me, and began to plan how I could make things nicer for you."—Kate Hamilton, in Sabbath School Visitor.

Use a teaspoonful of ammonia in the water in which dishcloths are to be washed and the dingy look will soon disappear.

MRS. BEST'S LETTER.

My dear Friends:

Practically all summer garments have disappeared from the shop windows and each week brings a new and fresh supply of articles for winter wear.

One store had a whole window full of blouses made of Georgette crepe in the new fall shades of Roman Gold and Grey. These were very stunning looking, but of course are suitable only for wear with certain colors. Much more utilitarian and almost equally as pretty are the crepe blouses of dark blue and green. These are made with clusters of fine tucks and have white collars and cuffs with a touch of colored embroidery on them.

But nothing could be more dainty than the white ones, of which there is an ever-increasing number. Many of them have soft revers down the front and large, soft collars—a style particularly becoming to girls and slender women.

With the exception of a few net waists, practically all the dressy waists are made of Georgette crepe; and while it many times is wonderfully thin and sheer, it really wears pretty well. It launders well also, but if you have a nice garment, it pays to dry-clean it for awhile.

For street wear with tailored suits, the new striped silk waists are very modish. These silks are dark with lines of bright color and are strictly tailored—high neck with turn-over collar and long sleeves terminating in a tailored cuff. A pretty finish at the neck for these waists is a band of ribbon with a made bow in front.

It looks to me as though the soft full revers were the first step toward the old-fashioned jabot that did do wonders about dressing up a plain waist.

The white broadcloth collar and cuff sets are here in full force—some of them have a touch of embroidery and others are perfectly plain. They are finished with a picot edge usually, but I saw one set with the old-fashioned "pinked" edge and very pretty it was. Being a novelty, the price is correspondingly high, but they could be made at home. So far, they are worn mostly on dresses, but I was told they were to be used on tailor suits as well.

As to tailor suits, there seems to be considerable latitude as to style—some of the coats are long, others short and the same is true of skirts, so there seems to be a style for all ages and figures, and all any of us need to do, to be well dressed, is to find our style. Yours devotedly,
Rosabella Best.

EAST INDIA CHUTNEY.

Pare and core twelve sour apples. Peel one mild onion. Remove seeds and stems from three peppers, one of which should be red. Seed one cup raisins and extract the juice of four lemons. Chop the apples, peppers, raisins and onion very fine. Add one pint cider vinegar and one-half cup currant jelly and let simmer very gently for one hour, stirring often. Add one pint cider vinegar, two cups sugar, one tablespoon each salt, ground ginger and cayenne; cook another hour, stirring constantly. Store as canned fruit.

"Young man, the best tonic for you is the right kind of food. I suggest for Breakfast

Ghirardelli's Ground Chocolate

It's easily assimilated — it's extraordinarily nutritious — and it is supremely delicious."

It comes PROTECTED—as all chocolate should—in ½-lb., 1-lb. and 3-lb. hermetically sealed cans.

Since 1852

GOOD HEALTH.

[By H. E. Pastor, M.D.]

Power On The Farm—Of Two Kinds.

It was gratifying to read in a recent issue of the Pacific Rural Press of the growing popularity and expanding use of the tractor and other forms of farm machinery designed not only to accomplish the maximum of work, at the minimum of cost, but to lessen, also, the exhausting physical drudgery of farm labor. The writer spent twelve to fourteen hours many a day trudging along the furrow behind a single moldboard plow on the prairies of Illinois, and again later in the season dreamed away the hours of an Indian summer day on the soft cast-iron seat of a mowing machine. He remembers well the aching toil of the one, and the pleasurable exercise afforded by the other in contrast. The expenditure of physical energy called for on the old farm was heart-breaking as well as suicidal. Little wonder that the grown-up boy and girl fled the farm home at the first opportunity. Many a man, and woman too, succumbed prematurely to this exhausting round of daily drudgery. Such work leaves no reserve force to withstand the invasion of germ diseases and other varieties. Every man should accumulate a store of reserve energy for emergency occasions, which occur in the lives of us all. When some part of our internal gearing goes wrong, or a swarm of disease-generating germs have stolen into our interior unawares, it behooves us to be in a state of physical preparedness to repel the invader, or to promptly readjust the disturbed mechanism. This a store of reserve strength will do most effectually, and anything that lightens labor on the farm contributes to this end.

The Cold Sore.

An esteemed correspondent hands in the following useful item: "The

cold sore, or fever blister, in its early stages, will yield to an application of baking soda. As soon as the swelling is noticed moisten the spot and apply as much soda as will stick; repeat frequently, and after the swelling has subsided use a good cold cream. Spirits of camphor will overcome a cold sore, also, if applied before the skin has a chance to break."

Brieflets.

Alcohol, strong coffee, tobacco, and a too full diet are common causes of heat prostration.

Give the baby plenty of good, pure water, but don't give it too much food, nor give it too often.

If the baby is troubled with a persistent colic and diarrhoea, with greenish stools, and you are using cow's milk, try stopping the milk and substituting a good condensed milk, with some reliable cereal food prepared expressly for babies.

Don't use cracked or chipped crockery or glassware; these broken places afford a nidus for all sorts of disease germs, often the cause of serious ailments.

NOVELTIES IN THE SHOPS.

Ostrich feather capes about 18 inches long, with high collars, are shown in one of the exclusive shops.

Baskets covered with fancy cloth and trimmed with gilt braid are being shown for candy receptacles.

The "Lucky Dog" fad seems still to flourish. These are little figures of dogs worn on a ribbon and supposed to bring good luck to the wearer.

The new silk hosiery has a drop stitch pattern that makes the stocking appear to be full of runs.

A new card table cover is of white linen, with a flet square in each corner, with a spade, club, diamond and heart design and a flet square in the center of the cloth has the number of the table in it.

Bordered wool challie is one of the new attractive materials. It comes mostly in light grounds with designs in colors.

Hand-crocheted yokes for night-gowns and chemises are shown in the needle shops.

CAULIFLOWER PICKLE.

Cut two heads cauliflower, one pint small onions and three red peppers into small pieces. Dissolve one-half pint salt in enough water to cover and let all stand over night. In the morning, drain off brine. Heat two quarts vinegar and add slowly four tablespoons mustard and one tablespoon flour. Add enough tumeric to color and boil fifteen minutes. Then pour over vegetables and seal.

HINT FOR PIE SHELLS.

In baking crust for lemon pie, invert the pie tin and put the crust on the bottom of the pan. This way it never puffs or crawls down as it is apt to do if baked inside the pan. After baking, it is easily slipped off.

Even Your Wear Can't Faze These Socks

If there's any work that makes a man's socks look "all-shot-to-pieces," it's farm work. You're on your feet most of the time, doing the jobs that are hard on shoes and even harder on socks. Don't put up with sore feet and quickly worn-out hose. Buy socks that are built strongest where the wear is hardest.

DURABLE DURHAM HOSIERY

has heavily reinforced heels, soles and toes—securely knit-on tops. Buy Durable Durham Hosiery for the whole family. It gives everybody longer wear because it is made from the stretchiest, sturdiest yarn we can make. It sells for 10, 15 and 25 cents. If your dealer hasn't Durable Durham Hosiery, ask him to get it.

When you're in town have the storekeeper show you the 25-cent Mercerized Durable Durham Hosiery.

Pacific Rural Press Market Report

PRICES QUOTED
AS PAID TO
PRODUCERS

San Francisco, Aug. 30, 1916.

Wheat.

Changes in the war situation have caused a very nervous and irregular market in the East, reflected to some extent on the Coast. Notwithstanding this, prices are still rather firm, and sharp advances are noted in Sonora, Northern red, and bluestem, the latter being very scarce.

[f. o. b. San Francisco.]

Sonora wheat \$2.07 1/2 @ 2.10
Northern club 2.07 1/2 @ 2.10
Calif. club, ctl. 2.05 @ 2.10
Northern Bluestem. 2.30 @ 2.35
Northern Red 2.10 @ 2.30

Barley.

Barley is much easier than last week, as regards both spot and future grain, and feed is quoted somewhat lower. The prospect of delay in shipping to the East is curtailing business, and export business is very light.

[f. o. b. San Francisco.]

Shipping, ctl. \$1.75 @ 1.80
Choice seed, ctl. 1.67 1/2 @ 1.70

Oats.

The only change is a slight advance in Texas red seed. The movement of feed is of moderate proportions, but seed is in good demand, with offerings rather limited.

[f. o. b. San Francisco.]

Red feed \$1.75 @ 1.80
Red seed 1.95 @ 2.05
White 1.70 @ 1.75
Black seed 3.00 @ 3.25
Texas Red seed 2.25 @ 2.35

Corn.

Eastern corn is little more than nominal, with little demand, and not much offered here. A railroad strike would of course prevent further shipments. This would probably strengthen the sorghum grains, but has not yet had that effect.

[f. o. b. San Francisco.]

Eastern Yellow, ctl. \$2.05 @ 2.10
Milo Maize 1.75 @ 1.80
Egyptian 1.90 @ 1.95

Beans.

With the old season about at an end, and stocks getting down to very narrow limits in most lines, the bean market is little more than nominal.

[On wharf, San Francisco.]

Bayos, per ctl \$5.40 @ 5.50
Blackeyes 3.50 @ 3.60
Cranberry beans 5.25 @ 5.40
Horse beans 4.25 @ 4.50
Small Whites (south) ... Nominal
Large Whites Nominal
Pinks 5.70 @ 6.00
Limas (south) 5.30 @ 5.40
Red Kidney 8.00
Mexican Reds 5.25 @ 5.40
Tepary beans 4.50 @ 4.75

Seeds.

Old stock scarce, with not enough new offered to justify change in quotations. Larger offerings expected shortly.

[Wholesale prices, S. F.]

Alfalfa, per lb. 23 1/2 c
Oregon Vetch 6 c
Mellilotus Indica 8 c
Mellilotus Alba 12 1/2 c
Bur clover, re-cleaned 10 1/2 c
Canada Field Peas 5 1/2 c

Hay.

Local offerings are still light, with few cars to be had, and impending railroad troubles threaten a shortage in the city market. Arrivals are mostly of common and inferior stock, but clean up quickly at well sustained prices. Local dealers report some sales in the country at a little easier prices than have been asked, owing to the desire of growers to clean up the fields before the rains begin; though a great deal of hay has been stored in the country and will be held back until needed.

[Wholesale prices per ton, carload lots, San Francisco.]

Wheat, No. 1 \$13.00 @ 14.50
No. 2 10.00 @ 12.00
Tame oats 11.50 @ 15.50
Wild oats 10.50 @ 13.00
Barley 10.50 @ 13.00
Alfalfa 10.00 @ 14.50
Stock hay 8.50 @ 9.50
Straw, per bale 35 @ .50

Quotations furnished by Nicholls-Loomis Co., Los Angeles, under date

of August 29th.

Barley hay \$10.00 @ 14.00
Wheat hay 10.00 @ 14.00
Tame oat hay 12.00 @ 16.00
Northern Alfalfa 11.00 @ 13.00
Local Alfalfa 12.00 @ 15.00
Stock hay 6.00 @ 9.00
Straw 5.00

Feedstuffs.

All lines as last quoted, with an active demand in the jobbing trade. [Wholesale prices, per ton, carload lots, San Francisco.]

Beet pulp, per ton. Nominal
Alfalfa meal, per ton. \$18.00 @ 19.00
Bran, per ton 28.00 @ 29.00
Oil Cake Nominal
Cocoanut cake or meal 23.00 @ 25.00
Cracked corn 44.00 @ 45.00
Middlings 35.00 @ 38.00
Rolled barley 34.00 @ 35.00
Tankage 45.00
Rolled oats 34.00 @ 35.00

Vegetables.

Arrivals in several lines have been far in excess of local needs, resulting in weak prices. Cucumbers are practically given away, large lugs going as low as 15c; tomatoes not much better, though cannery demand helps out. Bell peppers weak and hard to clean up, eggplant is cheap. Summer squash and okra holding up comparatively well, green corn rather firm, little good stock offered.

Celery, Alameda, bunch. 20c
Cucumbers, lug 15 @ 30c
String Beans 2 @ 4c
Summer Squash, lugs 30 @ 40c
Peppers, bell, box 25 @ 30c
Eggplant, lugs 30 @ 40c
Peas, lb. 4 @ 5c
Tomatoes, lugs 25 @ 50c
Green Corn, sack 50 @ 1.50
Okra, box 40 @ 60c

Potatoes and Onions.

The potato market is easing off a little, with prospect of shipments to outside markets being stopped and River surplus being turned this way. Onions have stiffened up a little,

with moderate supplies. Sweet potatoes dropping on larger receipts.

[On wharf, San Francisco.]

Potatoes, ctl., Delta \$1.25 @ 1.75
No. 250 @ 1.00
Salinas 2.25 @ 2.35
Sweet Potatoes, per lb. . 2 1/2 @ 2 3/4 c
Onions, yellow 1.05 @ 1.30
Garlic, new crop, per lb. . 4 @ 5c

Poultry.

A good many turkeys are arriving, moving readily. Receipts of chickens eased up at close of last week, but some were carried over; with increased offerings this week values show little strength. Young stock is doing a little better, as the flood of chickens from nearby points seems to be about over.

[Wholesale prices, S. F.]

Turkeys, live, lb 22 @ 25c
Broilers, 18 lbs. to doz. and less, lb. 23 @ 25c
do, over 18 lbs. to doz. 22c
Fryers 22c
Hens, extra, per lb, colored 18 @ 19c
Small leghorn 15 @ 17c
Smooth Young Roosters, per lb. (3 lbs. and over) . . . 23 @ 24c
Squabs, per doz 2.00 @ 3.50
Geese, per pair 2.25 @ 3.00
Ducks 13c
Old 12 @ 13c
Belgian hares 10c

Butter.

Arrivals have slowed up considerably; with Los Angeles bidding for supplies prices have jumped 2c for extras, lower grades being unchanged.

Thu. Fri. Sat. Mon. Tu. Wed.

Special Deciduous Market Report.

By J. L. Nagle.

Sacramento, Cal., Aug. 28, 1916.

[The following letter was written before the railway strike situation became acute. On Tuesday the western railroads placed an embargo on eastern fruit shipments.—Editors.]

As previously reported the movement of Malaga grapes continues heavy, in fact unnecessarily so, with the result of depressed markets. The quality also is inferior, due to unseasonable weather during the ripening period. The demand, however, in the smaller markets is greater than was anticipated, but prices at private sale are more or less regulated by the auctions.

The shipment of Tokays is moving at the rate of twenty cars and will probably increase to forty cars daily by the latter part of this week.

Mountain Bartletts are moving in light supply and crop will be practically cleaned up this week.

tically cleaned up this week.

Some few cars of clings are being shipped East but the majority of the stock is going to the canners.

The following prices have ruled for the week:

Chicago.—Bartlett pears averaged \$2.56; B. Hardy, \$1.70; Grand Duke Plums, \$2.06; Kelsey, \$1.48; Lovell peaches, 88c; Phillips cling, \$1.20; Malaga grapes, \$1.08; Tokays, \$2.16.

New York.—Malaga grapes averaged, \$1.05; Thompson Seedless, 88c; Tokay, \$1.50; Bartlett pears, \$2.72; Elberta peaches, 98c; McDevitt clings, \$1.32; Orange clings, \$1.17; Lovells, 83c; Susquehanna, 96c; Crawford, \$1.07; Kelsey Plums, \$2.07; Grand Duke, \$2.10; Gross, \$2.12.

Total shipments to Aug. 29, 9817 cars; total shipments same date 1915, 7441 cars.

Special Livestock Market Report.

San Francisco, Cal., Aug. 30.

No change in local quotations this week, but the threatened railway strike will bring a shortage unless enough livestock can be obtained by river and sea.

All hogs purchased by Western Meat Company are subject to seller standing one-half of any loss occasioned by any of the hogs being condemned for disease.

This has been somewhat rigidly enforced since May 1 on account of the high percentage of tubercular hogs which come from dairies where they are fed unpasteurized skim milk. Arrivals lately have not been so tubercular, but growers still show wasteful haste in taking stock off from stubble.

Practically all lambs arriving here are from Nevada and are good stock.

Shipments from Nevada to Chicago were embargoed by the railroads Aug. 25.

Cattle dropped hard in central western markets last week, but the effect was not felt here.

Wool markets show no change.

North Portland, Ore., Aug. 28.

Cattle.—Steers in many cases somewhat lower. Cows slightly advanced. Steers \$6.25 to \$6.75; Cows \$5.25 to \$5.40.

Hogs.—The swine market was steady to at least ten cents better than last week's close. Receipts twenty-two hundred today. Prices \$9.75-\$9.85.

Sheep receipts small and no change recorded. They were only ordinary in quality. Lambs \$8, ewes \$4.50.

Cheese.

Demand is very light, current offerings are slow to clean up, though prices are maintained on about former level.

[S. F. Dairy Exchange prices.]

Deciduous Fruits.

Little change is noted in values at present writing, but a general demoralization of the market is expected before the end of the week, as the railroads have refused to accept eastbound shipments of perishable goods, and the fruit is already being diverted to this market, causing a rather panicky situation. Local dealers say they can take care of cling peaches in good shape, as canners are anxious for more stock; but there will be an excess of free-stones, and heavy glut of grapes expected.

[Wholesale prices, San Francisco.]

Huckleberries, fancy, lb. . . . 8 @ 10c
poor stock 5 @ 6c
Currants, chest \$3.00 @ 4.00
Blackberries, chest 2.50 @ 4.00

Muscat, small box 60 @ 75c
Grapes, Thompson, crate. . . 60 @ 75c
Tokay, crate 75 @ 90c

Dried Fruits.

Dried fruit market continues in lethargic condition, with some apprehension of a serious interruption of shipments through the railroad strike. With the outlook so uncertain, Eastern buyers have not been induced to change their waiting policy, local packers are lying low until ability to make deliveries is assured. Aside from this the situation looks favorable, as it is coming to be generally recognized that the growers are in a strong position, that their views must be met before much fruit is to be had. Apricots have been boosted a little from last week's figure, and the inside figure on prunes quoted last week is also omitted, as it is impossible to get anything at that price. Figs retain former firmness, with great shortage in country's supply.

Apples, new crop 4 1/2 @ 5 1/2 c
Apricots, per lb. 1916.11 @ 12 c
Figs, white, 1916 5 @ 5 1/2 c
Figs, blk, 1916 4 @ 4 1/2 c
Calimyrna, 1916 9 @ 10 c
Prunes, 4-size basis, '16 5 @ 5 1/2 c
Peaches, old 5 @ 5 1/2 c
1916 5 1/2 @ 6 c
Pears 6 1/2 @ 7 c

[Associated Raisin Co. prices]

Fancy Seeded, 16 oz. 7 1/2 c
London Layers, 3-crown, 20-lb. box, 1916 \$1.35
Imperial Clusters, 6-crown, 20-lb. box, 1916 2.50
1 crown loose muscatels, 50-lb. box, per lb. 7 1/2 c
Sultanas, 50-lb. cases, per lb. . 8 c

Citrus Fruits.

The Eastern auctions are still paying fine prices for California oranges and lemons, ranging from \$6.90 down to \$3.90 for valencias, and \$7.15 to \$5.50 for lemons per box. Shipments have been going East at the rate of 60 cars of oranges and 10 cars of lemons daily. So far this

is conceded to be the best price year for several last passed, and if the railroad strike does not interfere, the rest of the season will be very good. There are about 2,500 cars of valencias yet to be shipped, with practically no holdover stock of lemons on hand.

San Francisco movement rather slow, but oranges show a slight advance in sympathy with primary markets. Lemonettes are slightly lower.

Oranges, Valencia, fancy, box	\$3.75 @ 4.00
choice	3.35 @ 3.50
Grapefruit, fancy	3.25 @ 3.50
choice	2.50 @ 2.75
Lemons, fancy	6.50 @ 7.00
choice	5.75 @ 6.25
standard	4.00 @ 4.50
Lemonettes	3.50 @ 4.00

Honey.
Values firm but unchanged, with stocks light and a very fair demand both locally and for shipment.

[Wholesale prices, San Francisco.]

country points	\$5.00 @ 5.50

Horses.
Local market in poor shape. This week brought another auction, closing out entire outfit of a big stable; many firms that have been using horses are gradually substituting motor power. The week's offerings include several cars of wagon horses and drafters from the country, many of them very attractive animals. Local prices have been up to the range quoted, but sales are not easy to close. Outside demand is good, further military buying is reported around the country.

[Approximate values in San Francisco, based on auction sales.]

Drafters, 1700 lbs and up	\$ 250
Drafters, 1550 to 1650	150 @ 200
Chunks, 1350 to 1500 lbs	150 @ 175
Wagon horses, 1050 to 1350 lbs	110 @ 150
Green Mountain range horses, 950 to 1200 lbs	20 @ 75
Farm workers	50 @ 100

Hops.
Values the same for old and new crops, but hardly any sales.

Sacramento	7 1/2 @ 8 1/2 c
Mendocino	8 @ 10 1/2 c
Oregon	8 @ 10 1/2 c

Hides.
Market fairly strong, with all offerings cleaning up readily at range quoted.

Heavy Steers, wet salted, 56 lbs and over	18 @ 19c
Medium steers	18 @ 19c
Heavy cows, over 48 lbs.	18 @ 19c
Light hides, 25-48 lbs.	18 @ 19c
Kip	20 @ 21c
Veal	27 @ 28c
Bulls and Stags	16 @ 17c
Dry Hides, 15 lbs. and up	31 @ 32c
Kip	34 @ 35c
Calf	38 @ 40c
Long wool pelts, each	\$1.75 @ 2.00
Short wool pelts	.85 @ 1.10
Lamb skins, long wool	.90 @ 1.10
Horse hides, wet, large	5.00 @ 5.50
Horse hides, dry, large	3.00 @ 3.50

Groceries.
Coast milling interests have again made a 20c advance in flour, family extras being held at \$7.20 to \$7.40 per bbl. New prices on canned salmon from first hands are: Reds, \$1.50 per doz.; Medium Red, \$1.30; Pink, 90c. The first lot of new Alaska salt salmon has arrived. Cured meats firm.

Publishers' Department.

Two hundred and five new subscribers were added to our list the past week.

Writing from Hanford, Mr. F. M. Barney says: "I am enclosing check for one dollar for renewal of my subscription to the Rural Press. Am highly pleased with same and so continue."

The following letter from Wm. A. French, the well known poultry fancier of Stockton, tells of his satisfaction in the use of our columns, also points out a new angle why it is successful. Here it is: "Mr. Frank Honeywell: They can talk all they want to about a poultry paper for advertising in, but give me an agricultural paper. I have tried them all and I find nothing to quite equal the Pacific Rural Press. More than 75 per cent of my inquiries say 'I saw your ad in the P. R. P.' Outside of what fowls I sell at shows, a large per cent of my orders come from your paper. My ad. will not be stopped. It will go right on another year just the same as the past. I am very busy getting 75 birds ready for the State Fair, or I would write a longer letter. Will I have the pleasure of meeting you there? Wishing the good old Press a very prosperous year."

In a recent issue of the Santa Rosa Democrat the following fine endorsement appeared of our old friend Yandle's prune grader and dipper: "Made in California, right here in Santa Rosa, home product, no getting around that! Yandle's prune grader and dipper, a revelation and revolution in prune-drying methods. Yandle's new machine puts the old time methods on the scrap-heap. Even 'craping,' uniform grading, greatly increased speed in handling, are the main attributes of Yandle's

new machine. So says Charles Ware, one of Bennett Valley's most enterprising horticulturists and foremost prune growers. Mr. Ware is highly pleased with this new twentieth century innovation in prune handling methods and labor-saving invention of Mr. Yandle, the local foundryman. You can pass this word around to the Sonoma county prune growers."

MISCELLANEOUS.

BUY DIRECT AND SAVE SEVERAL PROFITS.—Lumber, lath, shingles, moldings, doors, windows, frames, and finish at rock-bottom prices. Quality and satisfaction guaranteed. Send your lists for estimates. Sam Connell Lumber Company, Portland, Oregon.

GAS ENGINES.—I can furnish rebuilt Fairbanks, Morse, Otto, Peerless, Samson, Union and other good makes in all sizes. All investigators buy and all buyers are delighted. Pay when satisfied. J. J. Pottinger, 189 2nd St., San Francisco.

LIVING EXPENSES REDUCED THROUGH CO-OPERATIVE BUYING.—Write for catalogue and particulars. Pacific Co-operative League, D236 Commercial St., S. F.

BUY ROASTED COFFEE WHOLESALE.—Best, 10 pounds, \$3.00 delivered. Order with remittance. WM. J. SCHROTH CO., 112-B Market St., San Francisco.

REBUILT GAS ENGINES from 3 to 50 h. p. Thoroughly overhauled and guaranteed. We handle only high grade engines. Write us your requirements. Motors, Gas Engines bought, sold and exchanged. Mechanical Installation Company, 181-89 Second St., San Francisco.

SECOND HAND WATER PIPE and Screw Casing. New threads and couplings dipped in hot asphaltum. All guaranteed. Send us your inquiry. SPECTER PIPE WORKS, 306-8 Howard St., San Francisco.

FOR SALE—EXCHANGE.—Forty acres Chowchilla, California, improved level land. No waste. Well watered. Price of raw land. No alkali. Owner, Box 47, Rural Press.

PATENTS THAT PROTECT are procured through Pacific Coast Patent Agency, Savings and Loan Building, Stockton, California. Established fifty years.

TO REDUCE THE HIGH COST OF LIVING, send for our Wholesaler to Consumer Catalog. SMITHS' CASH STORE, 106 Cay St., San Francisco.

FOR SALE.—A good, strong surrey, almost new. \$75. Address Mrs. J. C. Larsen, Rt. 2, Box 80, Napa, Cal.

EVERY SIZE WROUGHT IRON WATER PIPE and screw casing water pipe, guaranteed as good as new. Prices right. Send for catalogue. We beat no one; everybody gets a SQUARE DEAL. Weissbaum Pipe Works, 160 Eleventh Street, San Francisco.

WANTED.

WANTED—ABOUT SIXTY YOUNG MEN and women to enter WESTERN NORMAL on August 28, 1916, to prepare for teaching. Western Normal graduates secure and hold good positions. We assist graduates to secure good positions and promotion. We also give a two-year high school course. For information, address WESTERN NORMAL, J. B. Humphreys, Principal, Record Bldg., Stockton, Cal.

WE WILL PAY YOU \$120.00 for congenial work in your own community. 60 days or less. Man or woman. No capital required. Opportunity for promotion. Spare time may be used. Full particulars free. International Press, 302 Winston Bldg., Philadelphia.

AGRICULTURAL COLLEGE GRADUATE.—three years' experience, two as foreman in large deciduous fruit orchard, open for engagement after Nov. 1, 1916. Box 228, Pacific Rural Press.

WANTED.—Reliable solicitors for country paper. Must furnish bond. 217 Underwood Building, San Francisco.

COUNTRY LANDS.

RANCH FOR SALE.—50 head of horses and machinery. 2000 acres of rich, sandy loam land for sale, on the east shore of Washoe Lake, Nevada, between Reno and Carson City, 1000 acres being cultivated, in alfalfa, grain and potatoes. The land is irrigated by a 400 H. P. Hydro Electric Pumping Plant, which belongs to the property, and the cost of pumping is less than 60 cents per acre. Fine cattle and sheep range outside of ranch property. Will sell this property as a whole or in small lots. Water right of 2000 inches goes with the land. Address W. G. Douglass, Virginia City, Nevada.

FOR SALE.—In the heart of California, 560 acres eighteen miles from Sacramento; no bed rock or gravel proposition; but deep, light adobe and red soil. The choicest of upland, finely situated for subdivision. Very little leveling to plant alfalfa; water never lower than 14 feet in driest season. Address Box 533, R. F. D., Route 3, Elk Grove.

WANTED.—Farms, large and small, in all parts of the State. Our system of placing owners in direct communication with buyers has brought us hundreds of applications for farms. What have you to offer? Write for our listing blanks. Western Farms Bureau, 680 Market St., San Francisco.

STATE SCHOOL LAND MAP, \$2.50.—County Sectional Map, showing Government land, any county, \$2.50. Free New August Booklet. Write Joseph Clark, Experienced Record Searcher, Sacramento.

FOR SALE.—36 acre ranch, well improved. For particulars, address W. K. Wheeler, Knight's Ferry, Stanislaus Co., Cal.

Leadership

Savage Tires, as did the old-time chieftains, won their leadership through honest worth. Their success is due to the miles of service and to the satisfaction they give their users.

Demonstrate Savage Leadership—you'll do it if you try only a single tire. Make any test you like and you will prove that the "Savage" is far in the lead.

Savage Grafinite Tubes are leaders, too. Examine one and you will see why. Try one and be fully convinced.

Opening Day at the State Fair.

[Written for Pacific Rural Press.]

IT'S the largest, most enthusiastic crowd I ever saw on the opening day of a California State Fair," said Director Chenu last Saturday. Women's and children's interests received unusual attention. Over 5,000 children are estimated to have been admitted free. They overflowed the grounds and made the day bright for everyone. A chorus of perhaps 200 of them sang for the large audience at the dedication of the Women's Building. A great tent was devoted to the handiwork of children—cooking, sewing, metal working, drawing and painting, wood work, etc. The large attendance of adults at this tent, as well as of children, indicated its popularity.

The significant event of opening day was the dedication of the Women's building. During the ceremonies Governor Johnson paid tribute to the women of California, and certain of their leaders in particular. It was open house for all visitors, and a constant stream of men as well as women expressed admiration of its conveniences for the comfort of woman visitors at the Fair. A nursery for babies, a kitchen, an emergency hospital, an art gallery, easy chairs, piano, etc., are features of the building. It is hoped to dedicate at least one new building at each State Fair.

Much to See.—If you should climb the big tower, which makes a blaze of light, to be seen far and wide at night, you might look over the Fair Grounds, and think that you could see it all in a day. Then you begin to go the rounds, stopping to ask questions about things that are interesting, and the day is gone before you are well started.

With all the extraordinarily increased exhibit space afforded by new buildings, big tents, and improvised shelters, there was scarce room for any more exhibits. The awards must be printed in next week's issue since we go to press too soon this week.

The Manufactures Building and the big tent behind it were filled with the latest and best things, of absorbing interest principally to our home-makers; but including also cement, irrigation pipe and well casings, exhibits by half a dozen State Departments, and other things too numerous to mention. There was a "haystack" of condemned short-weight scales which have been cheating the public. There was an exhibit on the care of the baby, and another on accidents to adults.

The Machinery Building was scarcely filled, but its big deep floor-tank was surrounded by pumps of great variety varying from pygmies to giants. The roofed and floored open-air addition to this building con-

tained silage-and-alfalfa-machinery, dairy equipment, concrete mixers, cultivation machinery, etc. Along the Fair Grounds fence was a very complete exhibit of dairy separators, engines, silage cutters, testers, etc. A 16x32 silo was newly erected, and a silage cutter was run by an auto. The automobile tent nearly 100 yards long, was comfortably filled the first day, and a special tent for auto trucks contained four different makes.

Tractors and tractor machinery had an exhibit field for themselves, and a demonstration field outside the grounds. On the opening day there

were about 20 tractors of eight or ten makes, besides cultivating machinery, tractor land levelers; a combined harvester, which would cut a 16-foot swath and contained a 45 h.p. motor to operate it besides a tractor which was to pull it. An olive grader and almond huller were also shown here. Two inclined platforms were ready to show what tractors could do. One was pivoted across center, so the tractor could tip it and then come down the other side. Several of the tractors were busy on the race track field.

The Agricultural Building could not contain all the magnificent county exhibits, which overflowed into the annex. Names of fruits exhibited did much to improve their educational value. These were not complete on the opening day, but Fresno had perhaps the finest fruit display, besides alfalfa and grains. Placer had a long panorama of its fruit districts made at infinite pains, and a good bit of fresh fruit under a pergola. Nevada had some pears, plums, apples and peaches so brightly colored that they seemed painted. Butte featured rice growing, having small fields growing in the customary water, at differing stages of maturity. Yolo featured fresh and dried fruit, butter, and nuts. The High School at Winters was finely reproduced in four or five kinds of dried fruit. Alfalfa, bees, grains and vegetables were also prominent. Colusa featured grains and nuts. Sacramento emphasized fresh and canned fruit, grains, and bees. Sutter displayed hemp fiber and plants, grapes, fruit and grain. Alameda had probably the greatest area and variety of exhibits, including fruit, vegetables, model poultry farm, and municipal and school displays. The Fancher

Creek Nurseries decorated a booth with ferns, palms, moss, and subtropical plants that made the air smell fresh, moist, and woodsy. There were a number of other agricultural and industrial displays more or less complete on opening day.

The Poultry Building, commodious as it was before, was well filled to the capacity of its large addition and was resonant into the night with praises sung by waterfowl in their new cement tank.

EDITORIALS

THE WEEK.

CALIFORNIA is making a new record this week by going on at full speed with her State Fair after the center was burned out of it by a conflagration which destroyed the main pavilion and its rich collection of exhibits, just as the fair was opening. To go on with the fair; to refill the place of a half a million dollar loss as far as possible; to throw more emphasis on other features of the fair, of which comments are given in other columns; and to use the fact of the great fire as unique advertising for the exhibition—all these acts betoken the California spirit in its force and buoyancy.

Otherwise also the State is wide-awake this week. The lifting of the rail embargoes on perishables set the fruit cars to moving even before Congress had actually shunted the trainmen's strike upon a siding. The expectation to make a record with fresh deciduous shipments for the whole season is likely to be realized, and average return of \$200 or \$300 per car beyond the normal of \$1200 will have a tendency to hold confidence and interest in fruit planting this fall and winter. It is announced that on the evening of Monday, the day the strike was to have taken place, between 600 and 700 cars of fruit and vegetables were started East by rail over three railways. This is 50 to 75 per cent more than the daily average of about 400 cars, which was maintained up to the time that the railroad companies laid their embargoes on perishable freight last week.

Assurance of railways wide open also comforts nearly half a million tourists who, it is said, are summering in our State—climbing the Alps of California instead of Europe. Continued flush times at the East not only make a capacious market for our fruits and fruit products, but stimulate the interest of Eastern people to see where they come from. And so it appears that not only during this summer but during the winter just ahead of us, California will shine large in the eyes of the country.

LAWS MADE WHILE YOU WAIT.

THE threat of railway operatives to arrest transportation unless their demands were complied with, has been appeased by the congressional enactment of their chief contention into the law of the country. It has been a phenomenon new and strange in human experience. A certain number of men, generally held to be less than one-half of one per cent of the population of the country, has, by organization, alertness and insight, grasped and wielded an industrial and political situation, through which it could coerce the supreme power of the nation to enforce its claim. Whether its claim was just, relatively to rights of others who are also operators in transportation, and to still others who are patrons of it, directly or indirectly, no one can really know—though all may have strong convictions, one way or the other. Therefore one cannot know whether the new act of congress, made while those who ordered it waited, will be in the end a blessing or a curse to this country. It had the obvious aspect of a na-

tional hold-up with an act of intimidation, which is usually accessory before the fact to a hold-up. In our judgment, as stated last week, it should be made a crime to menace the operation of a great public utility, but of course some other recourse or direction of appeal should be provided, for consideration of alleged grievances and final action thereon. This would seem to have been the rational thing to do when first sign of the recent menace appeared, but that was overlooked and the trouble allowed to drift until it became a matter of political life and death to the party having legislative power, to close the struggle with an anesthetic.

DOES THE END JUSTIFY THE MEANS?

EVERYONE is glad indeed that the railway strike has been averted, millions of value saved from destruction and millions of people saved from misery. But that does not at all signify that all people justify the menace nor the means by which it has been silenced. Both may have been necessary to arouse people from their lethargy to a consciousness of the fact that public rights require fuller regulation of both ownership and operation of public utilities and that reasonable regulation does not consist in invoking hasty legislation to quell threatened disturbance, but in discovering both absolute and relative rights and in requiring every man, and every organization of men, to walk in proper pursuit of its own rights without encroachment upon rights of others and without menace to the public interest. Whether the enactment of the proposed railway strikers' claim into a law is fair to their employers, to the patrons of the roads, who must ultimately pay the bill, or to other laborers in other fields who will get no advantage from the new law, has still to be determined. It is now stated that the trainmen will rally their forces to help their employers get an increase of rates and that puts the public in the position of being bitten by both. We are frankly glad that the strike was prevented. It now is a national duty to find out exactly what it cost everybody's rights to prevent it, in the way it was done, and to safeguard the country against ever having to buy its rights again in that way. "Eternal vigilance is the price of liberty!"

FARMING AND FIGHTING.

IT IS both interesting and important that a world which is constantly increasing in population should become more conscious and appreciative of its growing need of food supply. Now and then, for the last half century, chemists with statistical tastes have warned us that the world is fast approaching the time when its population must live on rocks which chemistry could make nutritive—but people have not been much scared by such announcements. But now we have assurance that the world is waking up and that war, not chemistry, is the alarmist. Marquis Capelli, president of the International Institute of Agriculture at Rome, is cabled as saying:

I look for development of agriculture similar to that which the world has seen in industry during the past quarter of a century. The war has educated the world and has made it realize the immensity of the problems connected with food supply. In my opinion, among the ultimate results of this war will be the increasing interest taken by governments in the development of agricultural wealth, namely, by the encouragement of co-operation and association, by promotion of instruction in agricultural matters, by the creation of many model farms and agricultural intelligence bureaus. So may this vital national industry be built up at last, on its legitimate foundation, on a really scientific basis.

And a fair conclusion is that when all these agencies are developed to the ends, which may now be fairly anticipated, we shall have food production and distribution on such a foundation of efficiency and fairness, through the application of the sciences, natural and economic, that those who are engaged in these lines of ministration to world needs will embody such spirit and influence that the war-making classes will be under their control. Then there will come the test of the truth of the claim that there always will be war. It is a fact that in all the warring ages of the world, food producers and distributors have been held in slavery by political or religious dominators. Kings and priests have made the wars for the sake

of dominion, temporal or spiritual, or both combined, and have sacrificed food producers in the making of it. If food producers, through science and economics, gain ascendancy, they will be likely to insist that if kings and priests declare war they must fight it for themselves.

ATTRACTIVE, BUT NOT YET SAVING.

IT IS perhaps not strange that in undertaking to establish a thesis that agricultural education is the crowning need of mankind, we should encounter some difficulties and apparent contradictions. For example they have a course of agricultural instruction in San Quentin prison and the agricultural pupils publish a very interesting agricultural journal. To establish the uplift in the farming study it would be necessary to show that graduates of San Quentin fly to rural scenes and never appear again in prison precincts. But in Judge Ogden's court in Oakland the other day three men were convicted of burglary and sentenced to Folsom prison. The transcript of the transaction is in this wise:

When sentence was pronounced by Judge Ogden, the three arose and requested that they be sent to San Quentin instead.

"We have all been there before, your honor," they said, "and have taken up educational courses which we would like to finish. We would like to have a chance to complete our work while serving time."

"Well," said Judge Ogden, "when a man of the age of 23 or 24 honestly desires to take up school courses, I shall never refuse the request. You may have your request and go to San Quentin."

The judge evidently took the youths at their best and did not raise the question as to how far a burglar could be expected to cherish honest desires. We are quite willing to accept his avoidance of that question also, but it is more difficult to explain the efficiency of the reforming agency when it leads a man to commit crime so that he can get back under the influence of it. It is surely a glowing tribute to the charm of the process, but not so clear as to the uplifting power of it. Still we have admitted that we could hardly expect that everything should sustain our contention at first. It may come around that way later.

WORLD HUNGER MAY MAKE SEAS FREE.

OUR own very narrow escape from agricultural ruin, through arrested produce-movement by rail, ought to give us a more realizing sense of the enormity of the wrongs visited upon non-combatant populations by the manner in which the current European war is being waged. All the belligerents seem to have had a share in these wrongs, either by seizing food ships or proclaiming embargoes or by submarine explosions—to such extent that the seas have ceased to be a public highway and all peoples, both warring and peaceful, have been made to suffer wrongs new to the world's history. It is quite possible that the same development which lifts food producers from slavery to Mars may also make them rulers in the dominion of Neptune, to the end that warships shall fight their own kind and none others. In his announcement of the International Institute of Agriculture, to which we have just alluded, President Capelli says this:

The rate of freight for a ton of grain from Buenos Aires to Genoa, Italy, was in June, 1914, 9.98 francs, while a few weeks ago the rate was 245 francs or 25 times more. Every man interested in agricultural matters has become anxious as to the serious drawbacks caused by these enormous fluctuations in ocean freights, and at the initiative of David Lubin, the United States Congress has adopted resolutions requesting this Institute in Rome to study the matter in all its bearings and to invite the Governments of every country to participate in an international conference with the view of making suggestions on the stabilizing of ocean freights.

If the food-rights of the world's masses are maintained by such international effort under the auspices of agriculture, it may be very influential with tribunals summoned after the war to write a new law of nations. The old law of nations is at the bottom of the ocean. If the points of view of the new tribunals are simply drawn from airships and submarines as war tools, without due reference to their dreadful infringement of peaceful peoples' rights, the roots of current cruelty will not be reached. The high seas must be free for peaceful traffic.

QUERIES AND REPLIES

INQUIRERS MUST
GIVE FULL NAME
AND ADDRESS.

A Scourge of Wireworms.

To the Editor: I have about an acre of rich sandy loam, always damp enough to raise corn or any kind of garden truck without irrigation, but the land is infested with small, slick, yellow worms about an inch long which kill anything I plant. We tried corn, potatoes, melons, pumpkins and beans. They killed everything but the weeds. Please tell me if there is anything I can put on the ground that will kill the pests.—A. L. M., Elizabeth Lake.

Your description indicates that your land is alive with wireworms which continuous growth of vegetables which they like has induced to multiply. The best thing to do now is to plow up deeply (for the worms go down as far as eight inches) and expose the soil to autumn heat and drouth as much as possible. Leave it rough and let it bake and blister in the sun as much as it can, and fence the fowls on it, if you have fowls enough to work it over well. This winter put on grain, cut it early for hay and then plow up the stubble and disk it deeply at intervals next summer to continue the drying and burning process on the worms and keep on the fowls to do the catching also. If you keep at this for a year from this date, vegetables will be reasonably safe the year following. There is no application which can be trusted, though systematic use of carbon bisulphide, poured in holes made with a bar and then covered in, would probably kill a great many. This process would be reasonable, but we are not aware that it has been demonstrated. The best natural enemies of wireworms are frogs and toads, and the horned toad is particularly good at them. Possibly you could herd them on your patch from the adjacent Mojave regions to advantage.

Trees in Desert Conditions.

To the Editor: I have an orchard of about eight acres of different kinds of deciduous fruits. The soil is a sandy silt lacking in humus. Some of the trees grew for a time and then all of a sudden dried up and died. I could find nothing the matter with the roots, or any holes around them. On some there is a black line around the trunk just at the surface of the ground. We irrigate by hand and dig a trench around each tree. What is the best commercial fertilizer to put around the fruit trees when we irrigate?—C. B. H., Gray Mountain.

You are in the Mojave desert region and are encountering conditions which are probably pretty near the line of tolerance by fruit trees. Certainly in such a soil you are not likely to give the trees by hand nearly as much water as they need to keep them growing in fierce heat and drouth—especially as the dry soil-mass all around draws away so much of the water which you do pour on. The black line you speak of may be alkali-burning or a scald by the sun before the water sinks away. If we were trying trees under such conditions we should whitewash from the main roots upward and cover the ground four feet around the tree with a litter of fine brush or dry weeds so that the sun could not get at the soil, and then pour the water through this litter. In this way you will keep the soil cooler and protect the bark from reflected heat. Do not put any commercial fertilizer around the tree. The desert soil is rich enough to grow young trees, if you can keep it cool and moist enough—unless it is loaded with alkali, which is also possible.

About Manure Pits.

To the Editor: I note in a recent issue that one man uses a pit with false bottom to hold manure up out of the liquid. Why so? I find that manure even in small quantities, without sufficient moisture, heats and burns, thereby driving off ammonia and burning up humus, two of the most valuable parts of the manure. The problem with me is to have a pit that will hold all the liquid and manure, and I think a pump to pump the liquid over the solids would be of value. By keeping manure in this condition, would it not prevent the breeding of flies, also an important problem?—E. E. G., Merced.

It depends upon the amount of liquids which go to the pit. If this is increased by flushings, the

pit will fill with liquid and submerged solids. Submerged solids will not compost properly and the mass will be heavy and mean to get out of the pit. Therefore, under certain conditions, a false bottom and a pump would be very desirable to get out the excess liquids for spreading with a cart or an irrigation ditch over grass lands, etc. Where the amount of liquid is not relatively large, your plan of using a pump would be reasonable, but probably not necessary, for the coarse stuff would be likely to currently absorb and hold it. Keeping the solids submerged would prevent fly-breeding, but keeping it moist enough for slow fermentation would not bother the flies, but they do not operate usually in manure which is more than about ten days old.

Cutting Back Acacias.

To the Editor: This spring I planted acacia trees and they are inclined to grow very tall and spindly and have to be supported by tall stakes. I would like to know if it will do to head them back: to cut them off, say, seven or eight feet from the ground. If this is practicable, when is best time to cut them off?—A. W. M., Hughson.

Our experience indicates that acacia trees do not care how much they are cut back or when. We should cut as soon as it seemed to us desirable. But though the tree does not care the grower ought to. That, however, depends upon what kind of acacia it is. If it is a species which naturally makes a tall, pyramidal tree (like the melanoxylon or black-wood) it makes an ugly tree to cut back the leader. Perhaps the most grotesque trees we have ever seen are some street trees of black-wood acacia which were topped off by the electric light wiremen and then undercut by the street department for the protection of circumambient millinery. On the other hand there are other acacias which will stand forming like a peach tree and still look well. Leaving out all questions of taste, we should say: cut your acacias when you like and the sooner the better.

Sour Cherries for Elevations.

To the Editor: You recently said in answer to a question that sour cherries are good in frosty places. How will they do at elevations of 4000 feet which are good for grain and alfalfa but only make a fruit crop about twice in five years?—C. E. B., Petaluma.

Sour cherries are probably best for hard places because the trees have natural sense enough to remain dormant through the occasional warm spells in the winter. When such high temperature is followed by hard freezing many trees, both fruit and ornamental, are apt to be hurt. Trees which keep quiet then and start late in the spring are most likely to come through with fruit. But at elevations there are also, in some years, sharp frosts in late spring or early summer which kill young fruit which has started reasonably late. Apples sometimes are lost that way and when they go we should expect to lose sour cherries also. But it is still true that where there are hard winters you may get sour cherries when you have practically no chance with sweet cherries.

Action of Lime and Sub-soiling.

To the Editor: Will lime or anything else applied to red soil with clay near surface help toward making porous the underlying clay so as to keep trees from sour-sap? Will sub-soiling help drainage much?—L., Esparto.

Lime in solution will promote friability of clay so far as it comes into contact with it, near the surface or below, but the effect will be too slight to prevent sour sap from lack of drainage. Sub-soiling might help drainage very much if it reached below a thin hardpan layer and broke it up, admitting water to pervious layers below. Otherwise it would not help drainage much. It would, however, increase the water-storage capacity of the land.

Knobby Peaches.

To the Editor: I send a peach, showing a disease that has ruined one-fifth of my crop this season. It was worse on my Muir peaches than the Crawfords or Elbertas. This is a seedling peach I am sending you, and it is not so bad on them.

I sprayed for curl leaf last spring, and had very little of it, but this canker, or whatever it is, has spoiled a great many fine large peaches.—J. G. L., Arroyo Grande.

The knobby appearance is due to the fact that when the peach was very small it was bitten into or punctured here and there by some small insect. Wherever the bite or puncture was placed the flesh refused to grow—leaving pits here and there because the rest of the pulp enlarged naturally. The result is the knobby, warty, or pitted peaches. It is not known what insect does this, and until it is caught at work, cannot tell whether it is a "biter" or a "puncher," and therefore cannot say whether it can be poisoned, as is the codlin moth larva, or not. The spray for curled leaf naturally would not bother this pest.

Red Spider Makes a Clean Sweep.

To the Editor: A few days ago, one of my fine, healthful bean plants changed entirely to the condition of this leaf which I send. The next day they all went the same way. Since then everything, such as peas, tomatoes, turnips, lettuce, cabbage, etc., seem to have perished. The plants are in the midst of an orange grove; soil red and fertilized with horse manure and commercial fertilizer; irrigation regular and careful cultivation. If it is a disease, please let me know how it can be prevented or cured.—J. M., Oroville.

This bean plant has made large growth and the root is healthy. The foliage has gone yellowish white and is roughened or scarified. The injury is apparently due to red spider, which is abundantly present. In the interior this pest finds heat and dry air, which enables it to multiply marvelously. The protection of the plants can be secured by sulphuring the leaves just as almonds are sulphured for the same pest and grape-vines are sulphured for mildew. This must be begun much earlier in the season, as soon as the weather gets dry and hot, and continued at intervals as the plants make new leaves.

Grasses for Wet Land.

To the Editor: Will Italian rye grass do well on very wet ground, and what is its feeding value? Will it reseed itself and when is the best time to sow? The meadow now grows wild grasses; in the drier parts grasses such as mesquite, clover and wild timothy; on the wet part of the meadow all kinds of slough grass and plenty of it. Will rye grass do or is something else better?—W. W. B., Kelseyville.

We know nothing better than the rye grasses for such a place. They will grow on wet, cold ground; they will stand overflow and summer baking of a heavy soil also, if there is moisture underneath. We should sow Italian and English rye together, half and half, and add a little alsike and common red clover also, for sometimes they hold on well on land where water kills out alfalfa. Get in the seed in advance of the rains or very soon after they start, so as to start the plants well before there is enough cold water to rot the seed.

Woman Apricot Grower.

To the Editor: I am a woman farmer. I harvest over 7½ tons of dried apricots from eight acres, and 300 crates of green fruit. I do all the managing—have followed the farming business for over 15 years. The land seems well adapted to apricots, though they make a specialty of almonds here. It is going right ahead as a fruit country. This is my second year here. I hope to have a record crop next year by heavy pruning and spraying.—Mrs. P. J. M., Arbuckle.

How you prune and spray, and why, might make your story complete and of value to our readers.

Lime and Flies.

To the Editor: Would sprinkling the manure pile with lime keep flies from breeding? Would the lime injure the manure?—F. P. W., Soulsbyville.

Lime has no standing for treating manure to prevent fly-breeding. If it is caustic lime it will injure manure by setting free ammonia.

California Weather Record.

The following rainfall and temperature record is furnished the PACIFIC RURAL PRESS by the United States Department of Agriculture Weather Bureau, at San Francisco, for the week ending at 5 p. m., September 5, 1916.

STATIONS	Past Week	Rainfall Data		Temperature Data		
		Seasonal To Date	Normal To Date	Max'm	Min'm

California Fruit Growers' Exchange, 1916.

[Extracts from Annual Report by General Manager G. Harold Powell.]

During the year ending August 31, 1916, there were shipped from California 37,279 cars of oranges and 7,258 cars of lemons, making a total of 44,537 cars. The Exchange shipped 24,056 cars of oranges and grapefruit and 5,812 cars of lemons, consisting of 9,666,722 boxes of oranges, 75,533 boxes of grapefruit, and 2,363,173 boxes of lemons. The money returned by the Exchange to the shippers approximates \$27,500,000, which is nearly 7 million dollars more than the largest preceding year, or an increase of approximately 33 per cent. The delivered value of the fruit is approximately 38½ million dollars. Using the Exchange returns as a basis for computing the value of the crop, the amount returned to California for the citrus crop of 1915-16 equals \$41,000,000.

Figuring on a carload basis, Exchange growers forwarded 67 per cent of the total shipments, which is an increase of 4½ per cent over last year in the proportion of the crop handled. This increase represents the largest annual gain in membership in recent years and brings the proportion of the crop handled by the Exchange to the highest percentage in the history of the industry. Since the close of the shipping season several associations of growers whose fruit is not included in the proportion given have joined, while no association has withdrawn from the Exchange. There are more than 8,000 growers in the Exchange.

In thirteen years the Exchange has returned to California \$192,500,000 and during this period the losses from bad debts and from all other causes have amounted to only \$7,688.56, or two-fifths of one one-thousandth of one per cent of the total returns. This business represents transactions with 2,500 jobbers in the United States and foreign countries.

Cost of Exchange Service.—It cost Exchange shippers approximately 4½ cents per packed box to distribute and sell oranges, and 5¼ cents per packed box to sell lemons to 2,500 jobbers. This makes an average marketing cost of 4.65 cents per packed box. The growers also paid an average of 1 cent per box for the District Exchange service, making the total average distributing and selling cost 5.65 cents per box, or 1.73 per cent of the delivered value of the fruit.

In addition to the above approximately 2½ cents for every box of oranges and 4 cents per box for lemons was invested in national advertising and in the dealer service work through which the publicity is made more effective and the jobber and retailer are brought into closer relationship with the Exchange. The Exchange service, including that of the central office and the 77 sales agencies in the United States and foreign countries, is not only the most comprehensive that has been developed for any agricultural crop, but it is also less expensive than any other general marketing service, even when the cost of the "Sunkist" advertising is included.

Exceptional Conditions.—There has been a wide difference between the conditions under which the cit-

rus fruit crops were marketed in 1915-16 and in 1914-15. Abnormal prosperity has been general this year. Men were unemployed, buying power was low, and the demand for citrus fruits was at low ebb. Weather conditions throughout the United States and Canada have been favorable for the movement of the crop. Excessively hot weather in July and the first half of August, which contrasted with the abnormally cold summer in 1915, created a strong market for lemons and Valencia oranges, both of which are used in large quantities during hot weather in cold drinks. There has been little frosted fruit to market, the quality of the navels, Valencias, and lemons has been good, and the distribution backed by the accumulative effect of national advertising has been wider and more uniform than in any previous year. The high point in the country's prosperity which has caused extraordinary demand for food products by the laboring classes should not be considered an index of what the industry may expect when trade conditions again become normal.

Navel Conditions.—There are in California 40,000 acres of Washington Navel orange trees below the bearing age. The crop must be marketed in the face of rains in California and cold weather in the East, which interfere with the most uniform daily distribution. It must also be marketed in competition with the Florida crop which is slightly more advanced in maturity. The shipment of only mature oranges early in the season, coupled with national advertising, is fundamental in increasing the consumption of the fruit and successfully meeting Florida competition. Improvement in cultural methods will bring about better oranges, the control of brown rot by orchard treatment and a more careful handling of the fruit to prevent blue mold will help raise the low prices generally realized in February, while the growth of the Exchange will make it possible to market a larger proportion of the crop under the most desirable conditions.

The 1916 Valencia Crop will be the largest in the history of the industry and will aggregate between 13,000 and 14,000 carloads. In 1915, the Valencia shipments equalled 9,500 carloads, and in 1914, 12,000 carloads. The crop as a whole is of excellent quality. Notwithstanding an increase of over 40 per cent over the crop of 1915 and a predominance of small sizes, the Valencia grower's average return has been equalled only once in recent years. This is due to the unusual prosperity of the country, the national advertising of the Valencia as a summer fruit, the development of a very large consumption of orange juice as a result of the Exchange's advertising and promotion work, and to the uniform distribution of the crop week by week. Hundreds of orange juice stands have been established throughout the country during the last two years, fresh orange juice as a beverage has been pushed by drug stores, soda fountains and restaurants, and the

custom of drinking orange juice in the home has been established by a campaign inaugurated by the Exchange three years ago.

The Lemon Crop shipped by the Exchange growers, amounting to 2,363,173 boxes, is larger than that of any previous season. The number of lemon shippers who have joined the Exchange this year is the largest in the last ten years. The demand made it possible to ship freshly picked fruit throughout the season, and as a consequence it has been received with general satisfaction. The year-round distribution has never been so wide or so uniform. There has been an unprecedented demand for lemons during July and the first half of August as a result of the extreme heat east of the Rockies. Exchange shipments during the period of high

prices were the heaviest of the season.

The demand for lemons in the summer time depends primarily on weather conditions because the fruit is used largely in making cold beverages. When the summer is cold, as in 1915, the demand for cold drinks is lessened and a large crop cannot be moved at satisfactory prices. In 1916, the total supply of California and foreign lemons sold in June, July and August was approximately 192,907 boxes above the average of the last five years, notwithstanding the higher prices. The receipts of foreign lemons have been lower than the average of the last five years.

Note: As this report was prepared a few days prior to the end of the fiscal year, data regarding shipments may be slightly changed.

Fall Irrigation Helped Peaches.

[Written for Pacific Rural Press by J. P. Duff, Fowler.]

[Mr. Duff got fall growth four inches long on two acres of his seven-year Muir peach trees, by flood irrigating them Sept. 1, 1914, after the light crop had been off about 10 days. The soil is sand twelve feet down to water. The trees had stopped growth, not having been irrigated since June. The four-inch 1914 shoots grew thriftily through 1915. They were located along the main limbs, protecting them from sunburn, and where the fruit did not exert destructive leverage on the limbs. The irrigated trees were in 1915 noticeably thriftier in growth and greener in foliage than those nearby which had not been fall irrigated.]

"Two years ago I irrigated two

acres of peach trees after the fruit had been picked. I got a good crop last year and this year too. The trees look fine—no red spider or little-leaf on them as on a good many trees that have not had plenty of water.

"This summer I intended to irrigate my entire orchard after the fruit was off, but help was so scarce that I didn't get it done till the water was gone.

"I certainly would advise any one to irrigate in late summer if at all possible.

"Summer Pruning.—We thin out the inside branches on young peach trees and avoid much heavy pruning in winter. Also prune apricot trees in July after the fruit has been picked.

THOSE DATE PRICES.

There seems to have been something fearfully wrong with our date price figures in the issue of Aug. 19. We print below, extracts from a letter written by Carl R. Loop, Deputy Consul General at London, England, to Prof. J. Eliot Coit of the University of California under date of April, 1914.

"The quantities of dates imported into the United Kingdom in 1912, the latest year of which statistics are available, were as follows:

	Cwt.	Value
From France	37,052	\$ 351,785
From Turkey, Asiatic	525,012	1,574,006
From Egypt	11,381	64,451
From Tunis	90	720
From Persia	30,887	84,535
From Other Foreign Countries	2,756	8,234..
From Gibraltar	868	12,653
From British India	10,774	31,545
From Other British Possessions	331	881
	619,158	\$2,128,810

1 cwt equals 112 lbs.

The quantity received from year to year, however, shows considerable fluctuation; in 1911 only about a quarter of the above total was imported. In years when the crop is small, and the imports correspondingly low, prices necessarily rise. At the present time whole sale prices of dates range as follows:

Sayir (Persian) ...	\$2.43 to \$2.67 per cwt.
Khadrawi (Persian) ...	3.18 to 3.65 per cwt.
Halawi (Persian) ..	3.77 to 4.02 per swt.
Tunis (in boxes or cartons, each containing 1 lb.)	2.92 per case of 50
Dates from Asiatic Turkey averaged about	\$3.00 per cwt

In 1913, for the first time, dates were imported into London from the

United States to the extent of 4,237 cwt., valued at importation at \$7,971, or approximately \$1.88 per cwt.

The Deglet Nur date, I am informed, is not known in this country. It is stated that the market here is very well supplied with Algerian and Persian and other dates, and there is not a very good demand for a high class article such as the Deglet Nur date is understood to be.

MALAGAS GOING WRONG.

To the Editor: I have Malaga grapes and fear that something is lacking in the soil. Stable and green manure they have had quite a good deal each year. Vine growth is usually heavy but there is not sufficient setting of fruit, and so much of the fruit this year softens, shrivels and has a sour, bitter taste. Some berries do not develop and mature in size and quality as they should—M. H. M., Reedley.

[Answered by Prof. E. T. Bieletti.]

As the vines are making good growth this fact may be taken to indicate that the soil is probably all right. The failure of the fruit to set may be due to spring frosts or to improper pruning. Strong growing Malaga vines require spurs of three or four buds. The poor quality of the grapes which do grow, however, cannot be accounted for in this way. It may be that there is some disease present, but I am unable to say from the writer's description. If he will send me a small sample of the grapes, leaves and canes I may be able to determine whether any disease exists.

Cover Crops for Soil, Fruit and Livestock.

Alfalfa and Oats Have Softened a Cementy Soil, Helped Rejuvenate the Apricot and Prune Orchard, and Furnished Hay for Livestock on the Ranch.

(Written for Pacific Rural Press.)

The soil in F. R. Shafter's apricot and prune orchard six years ago "would cement together like a road after every rain." The trees of both kinds of fruit were in bad shape, half dead. He took out half of them. They had been 20 feet apart. The rest are in fine shape now, and the soil takes water better and works finer.

There are 25 tons of red oat hay in the barn now, which will feed the livestock. It was taken from the 10 acres of prunes; and he expects two tons per acre of dried prunes this season from the trees, which were planted some 30 years ago.

From five acres of apricots, he was taking the fourth cutting of alfalfa about the middle of July. Some of the alfalfa not yet cut stood over hip tall and in full bloom, with new growth from the crown 6 to 12 inches tall; and a good stand close to trees as well as in the middles. This was fed to the cows through summer and winter.

For six years this alfalfa has furnished hay, shaded the ground, and subsoiled it without injuring the tree roots. The trees are vigorous, healthy, and clean with plenty of big dark leaves and good wood growth.

A heavy crop of fruit set last spring, but the rains rotted it, so the crop is light, in common with the rest of the State.

An uncultivated orchard in Santa Clara Valley is rare in summer. It seemed a sign of shiftlessness to neighbors, who prophesied ruin of the orchard when they saw Mr. Shafter's alfalfa and oats growing after they had plowed their orchards.

Alfalfa in the orchard was not an experiment with Mr. Shafter six years ago, for he had been growing it on a half-acre back of the farm buildings for five years before. This half-acre was not plowed up until 1914. It was sowed again, and pastured too close for hay. In the 5-acre piece, alternate rows of trees are checked, with trees in the levees. The first irrigation in spring takes

three days. The soil is not yet sufficiently improved; for later irrigations require only two days. Probably this is due to use of the hay instead of disking it in. It takes five or six hours for water to reach the lower end in spring when winter rains have softened the plowpan; but in summer it gets there in three hours. Every cutting of alfalfa is irrigated twice, with some variation in both irrigation and cutting at apricot picking time.

Alfalfa among prunes, looked to Mr. Shafter like too much unnecessary work and injury to fruit at harvest.

Oats Among Prunes.—When oats were first sowed among the prunes six years ago, Mr. Shafter hadn't gotten a crop in two years from the trees, and the ground was so poor and hard that even oats wouldn't grow well. They had to be sowed two or three times.

Now they yield so well that the hay stored in the barn will last two years; and this fall a legume cover crop will be planted to turn under in the spring.

Last winter, 12 sacks of red oats were planted on the 10-acre prune orchard after the first rains, Dec. 23. They were cut just before May 25, 1916.

This ground was then irrigated in the three days ending June 20, and as soon as dry enough it was plowed. Then it was worked down fine, finishing the cultivation July 18 with a clod-masher, ready for fruit to fall on the smoothed ground. Plowing was charged to the hay, so only cultivation was charged to the fruit.

Horticultural Commissioner Day of San Benito county reports the total bearing acreage of fruits in his county as follows: prunes 2400 acres, apricots 1500, peaches 525, apples 325, pears 250, almonds 125, cherries 70 and walnuts 25. There are 1100 acres of non-bearing prunes in the county and 1258 acres of non-bearing apricots. Last spring there were planted 42,153 prune trees, 28,100 apricot trees, and 20,066 pear trees, besides a smaller acreage of walnuts and almonds.

ACREAGE, YIELD, AND VALUE OF HORTICULTURAL AND AGRICULTURAL PRODUCTS OF RIVERSIDE COUNTY, 1915. (Compiled by County Horticultural Commissioner D. D. Sharp.)

DECIDUOUS.				
Variety	Acreage	Bearing Percent	Yield (Tons)	Price
Almonds	1,405	60	225 1/2	14c per lb.
Apples	3,330	24	487 3/4	3c per lb.
Apricots	6,011	44	8,430 1/2	\$36 per ton
Cherries	363	8	13	10c per lb.
Dates	600 trees		12 1/2	\$1 per lb.
Grapes	2,448	96	15,102	\$10 per ton
Olives	2,062	75	1,664	\$50 per ton
Peaches	2,894	63	6,152	\$22 per ton
Prunes	615	79	504 dry	\$80 per ton
Pears	948	32	825 1/2	\$30 per ton
Walnuts	2,002	20	91 1/2	12 1/2c per lb.
Totals	22,087	51	34,260 1/2	
Value				
				\$871,612
CITRUS				
Lemons	4,954	52	486,972 boxes	\$2 per box
Oranges	19,475	84	1,636,830 boxes	\$1 per box
Citrus	24,429	77	2,123,802 boxes	
				\$2,610,774
AGRICULTURAL				
Alfalfa	25,384		118,897 tons	\$12 per ton
Cotton	1,700		1,631 bales	12c per lb.
Beans	1,111		234 1/2 tons	\$100 per ton
Beets	750		9,000 tons	\$6 per ton
Potatoes	856		29,960 sacks	\$1.56 per sack
Grain & Hay	78,620		628,960 sacks	\$1.15 per sack
				\$2,372,115
Total value of Products				\$5,854,501

*The yield and value of the Hay and Grain crop is computed as entirely of grain, as it is not possible to segregate the two, but estimating the yield of hay for the entire acreage at 1 1/2 tons to the acre and the value at \$10 per ton, the result is not materially altered, the returns being approximately the same, with slight favor to grain.

Should Find You Equipped With
WINCHESTER
RIFLES AND CARTRIDGES

They will insure your success as they have that of thousands of other hunters. Don't take the chance of spoiling your hunt by using other makes, but take along Winchester Rifles and Cartridges—the always-reliable kind. You can get them to suit your ideas, as Winchester Rifles are made in Single Shot, Repeating and Self-Loading (or so-called automatic) models, and in various calibers; and Winchester Cartridges are made in all the different sizes. Ask your dealer about them and he will tell you they are "O. K."

"DATE GROWING

in the
NEW AND OLD WORLDS."
BY PAUL B. FOPENOE.

The author has studied the DATE GROWING INDUSTRY where it has flourished forty centuries—in Northern Africa and Arabia. He has also studied it in California and Arizona, and shows there are sections in these States where certain varieties of dates may be much more commercially grown than now and with great profit.

Aspects of Fruit, Nut and Grape Crops.

[Written for Pacific Rural Press.]

Compiled on the basis of the estimated per cent of a total normal crop of those counties in which more than two per cent of the respective fruits, nuts, and grapes are grown, the September report of Geo. P. Weldon, Chief Deputy State Horticultural Commissioner, shows all of them with the exception of walnuts, to be a below normal yield.

Almonds in the 10 counties growing 76 per cent of the total acreage average 66.5 per cent of a full crop, Butte with 12 per cent of the total acreage having 15 per cent of a crop, Colusa 4 per cent acreage and 75 per cent crop, Contra Costa 11 per cent acreage and 70 per cent crop, Los Angeles 2 per cent acreage and 80 per cent crop, Riverside 3 per cent acreage and 90 per cent crop, Sacramento 6 per cent acreage and 65 per cent crop, San Joaquin 12 per cent acreage and 50 per cent crop, Stanislaus 6 per cent acreage and 80 per cent crop, Sutter 9 per cent acreage and 75 per cent crop, Yolo 11 per cent acreage and 65 per cent crop.

Apples in seven counties having 90 per cent of the total acreage average 85½ per cent of a full crop, Humboldt with 2 per cent acreage having 100 per cent crop, Los Angeles 2 per cent acreage and 100 per cent crop, Monterey 12 per cent acreage and 65 per cent crop, Nevada 3 per cent acreage and 100 per cent crop, San Bernardino 4 per cent acreage and 50 per cent crop, Santa Cruz 51 per cent acreage and 85 per cent crop, Sonoma 16 per cent acreage and 100 per cent crop.

Figs, in eight counties with 84 per cent of the total acreage averaging 90½ per cent of a normal crop, Butte with 3 per cent acreage having 100 per cent crop, Fresno 53 per cent acreage and 100 per cent crop, Madera 3 per cent acreage and 60 per cent crop, Merced 9 per cent acreage and 90 per cent crop, Stanislaus 5 per cent acreage and 90 per cent crop, Sutter 3 per cent acreage and 100 per cent crop, Tulare 6 per cent acreage and 95 per cent crop, Yuba 2 per cent acreage and 90 per cent crop.

Peaches, in 13 counties, with 85 per cent of the total acreage, average 66 per cent of a normal crop, Butte with 3 per cent of the acreage having 30 per cent of a crop, Fresno 29 per cent acreage and 60 per cent crop, Kings 6 per cent acreage and 90 per cent crop, Los Angeles 4 per cent acreage and 85 per cent crop, Merced 3 per cent acreage and 70 per cent crop, Placer 6 per cent acreage and 75 per cent crop, San Bernardino 5 per cent acreage and 60 per cent crop, San Joaquin 8 per cent acreage and 75 per cent crop, Santa Clara 5 per cent acreage and 75 per cent crop, Siskiyou 3 per cent acreage and 5 per cent crop, Sutter 2 per cent acreage and 75 per cent crop, Tulare 9 per cent acreage and 85 per cent crop, Yolo 2 per cent acreage and 75 per cent crop.

Pears, in 12 counties with 76 per cent of the total acreage average 66 2-3 per cent of a normal crop, Alameda with 2 per cent of acreage having 80 per cent of a crop, Butte 2 per cent acreage and 70 per cent

crop, Contra Costa 6 per cent acreage and 65 per cent crop, El Dorado 3 per cent acreage and 60 per cent crop, Lake 8 per cent acreage and 40 per cent crop, Napa 4 per cent acreage and 70 per cent crop, Placer 7 per cent acreage and 70 per cent crop, Sacramento 18 per cent acreage and 60 per cent crop, Santa Clara 9 per cent acreage and 50 per cent crop, Sonoma 6 per cent acreage and 80 per cent crop, Tehama 2 per cent acreage and 75 per cent crop, Yolo 9 per cent acreage and 80 per cent crop.

Prunes, in seven counties with 82 per cent of the total acreage average 55 per cent of a normal crop, Butte having 2 per cent of acreage and 35 per cent of a full crop, Napa 4 per cent acreage and 40 per cent crop, San Benito 3 per cent acreage and 60 per cent crop, Santa Clara 55 per cent acreage and 55 per cent crop, Sonoma 12 per cent acreage and 45 per cent crop, Tulare 4 per cent acreage and 95 per cent crop, Yolo 2 per cent acreage and 50 per cent crop.

Walnuts, in five counties having 100 per cent of total acreage average 78 per cent of a normal crop, Los Angeles having 30 per cent of the acreage and 70 per cent of a full crop, Orange 38 per cent acreage and 100 per cent crop, San Bernardino 2 per cent acreage and 90 per cent crop, Santa Barbara 10 per cent acreage and 65 per cent crop, Ventura 20 per cent acreage and 65 per cent crop.

Grapes.—Percentages of a full crop in the various varieties are given by counties as follows: Butte, 70 per cent raisin crop, 70 per cent table; Fresno, 100 per cent raisin, table and wine; Kings, 100 per cent raisin and table; Los Angeles, 100 per cent raisin, table and wine; Madera, 110 per cent raisin, 90 per cent table, 110 per cent wine; Merced, 100 per cent raisin, table and wine; Napa, 35 per cent wine; Sacramento, 25 per cent raisin, table and wine; San Diego, 100 per cent raisin, table and wine; San Joaquin, 50 per cent table, 70 per cent wine; Santa Cruz, 50 per cent table and wine; Sonoma, 70 per cent raisin, table and wine; Stanislaus, 125 per cent raisin and wine and 110 per cent table; Sutter, 100 per cent table and wine, 90 per cent raisin; Tulare, 100 per cent raisin, table and wine; Yolo, 80 per cent raisin, table and wine; Yuba, 100 per cent raisin, table and wine.

WHY THOMPSONS AND NOT MALAGAS?

To the Editor: I have some Malagas and Thompsons on so-called dry-bog land but which is mixed with the heavier red soil. Thompsons did finely this year, but the Malagas do not yield much. Is it the fault of the soil or can it be improved? Is it possible that the vines did not get enough water? Is the soil too rich? The vines make a lot of wood in the stem, but did not throw out the wood that yields the crop. Would you graft them, or can you assure me that the soil is good for that kind of grape?—S. W., Fresno.

[Answered by Prof. F. T. Bioletti.]

From the indications of your correspondent's letter there seem to be

two possible explanations of the failure of his Malaga grapes to bear well this year. The forcing out of a lot of water sprouts from the stems might be caused by a spring frost destroying the fruit shoots or by too short pruning. If the fruit wood of the Malagas is lower than that of the Thompsons the latter might be high enough to escape the frost, which would account for their bear-

ing when the Malagas do not. If the soil is good enough to give good crops of Sultanina (Thompson Seedless) there is no reason why Malagas should not do well also.

Yuba and Sutter counties are facing the total destruction of their vineyards by the root-louse, or phylloxera. No effective remedy has yet been found for this pest.

ORCHARD TILE IRRIGATION.

To the Editor: I wish to irrigate a side-hill orchard so steep that surface water will run off rapidly and cut. Is tile irrigation pipe practicable if laid well below the plow?—E. H. W., Escondido.

[Tile irrigation is practiced in Florida truck gardens, but we know of none in California. For your steep hillside orchard we see no reason, unless it is first cost, why you shouldn't tile it on gentle contours with a line of small tile above each or alternate rows. It would be much more economical in maintenance and operation than surface irrigation, and will be more effective in reaching the roots, as well as in preventing evaporation of the water and baking of the surface soil.

That roots would not interfere seriously seems indicated by orchard drainage experiences. Among these G. Bray of Santa Clara county, whose drain tile were placed about three feet deep in adobe soil among two-year prune trees in 1891. Alfalfa roots plugged the tile in a field through which it ran, but in the orchard, prune roots never bothered. You could not do a half-job of irrigation very long, however, for the roots would naturally concentrate around the tile if moisture is lacking elsewhere.]

NEW PROLIFIC ALMOND.

To the Editor: A successful orchardist near Knightsen, George Smith, has been propagating a new variety of almond having a remarkable combination of good qualities. It is called "Smith XL," resembling IXL, but somewhat rougher and darker, with a heavier kernel.

It is a most prolific bearer, beginning the year after grafting, and the parent tree, a seedling, has had bumper crops every year for 18 years.

I grafted about 150 trees to this variety in 1915 (January) and this season gathered from one unusually vigorous tree a sack and a quarter of almonds and hulls.

These almonds are far superior to Texas, being surer bearers of much larger and softer nuts. We should show some appreciation of the good work done by Mr. Smith, as he has distributed scions generously gratis.—E. W. R., Oakley.

BLACK BEETLES ON STRAWBERRIES.

To the Editor: I lost my berry patch every fall for six years and now have had a patch that can't be beat for two years. The first berries we had were Climax and the bugs just live on them. We then tried Klondike, Clarke's seedlings, Dollar, and Ettersburg No. 121. The bugs didn't affect Dollar and Ettersburg, but they took all the others, so we beat the bugs and planted nothing but Ettersburg and Dollar. Catch every black beetle you see, as they lay the eggs. Jack Moungovan. Point Arena.

GRAPES ON SPRING GRAFTS.

[Written for Pacific Rural Press.] "I know a number of growers who are planning to dry Zinfandels this year, because they can make more money out of the poor quality

raisins than by selling for wine making," says one of the De Lano Bros. of Fresno county. Not many are interplanting trees among vines, but many are grafting their wine varieties to table and raisin varieties. One of my neighbors grafted some last spring and has a few bunches on the new grafts this first season. Some vines now have as many as four fairly good sized bunches on each. The sooner the rest of our wine grapes are grafted over, the better it will be for our raisin market, by eliminating the

poor quality raisins that are being made from wine grapes."

SPANISH MEASLES ON MALAGAS.

To the Editor: I am sending you a bunch of diseased Malaga grapes. Kindly tell me the trouble and a remedy.—M. H., Livingston.

[Answered by Prof. F. T. Bioletti.]

The spotting and drying up of the berries is what is usually called Spanish measles and the cause is not well known. It seems in some cases

to be due to an injury to the trunk or roots of the vines. Plow wounds or severe pruning wounds will sometimes be followed by these symptoms. Also, too much water in the soil in summer causes this trouble.

The head of the Fresno Internal Revenue District has sent out 17 gaugers to as many wineries in that district where the crushing of grapes for the manufacture of sweet wine has started. It will be their chief duty to check the brandy used for fortifying the wines.

THE CAR AHEAD A Hudson Super-Six

When you buy a car in the Hudson class you buy that car to keep. So the question is a big one. What that car is or isn't matters much for years and years. Let us look facts in the face.

Always the Master

The Hudson Super-Six, under every condition, will or can be "The Car Ahead."

No other stock car ever went so fast. None ever went so far in one day. None ever climbed such hills on high gear. And none ever picked up so quickly.

Those are facts based on official tests. And no car built can successfully dispute them.

So the Super-Six owner, in traffic or on highways, on hills or on levels, feels himself the master of the road.

Why You Should Care

We hear men say, "Well, I don't care. I don't want speed. I don't need that power."

But you do want—don't you?—the best car in your class, when you pay about the price that gets it.

Let the extra capacity remain latent capacity. Keep the speed and the power in reserve.

You can out-distance your rivals without going faster, because of the quick pick-up. In traffic and in hill-climbing you have less change of gears. Everywhere you get effortless performance. And you rarely tax the motor to half its capacity. That means long life and economy.

80% More Efficiency

The Super-Six invention—patented by Hudson—has added 80 per cent to this motor's efficiency. It does this by reducing vibration, the cause of motor friction. So it adds just as much to motor smoothness. And it adds just as much to endurance.

Our radical tests—like those cited below—seem to prove that the Super-Six doubles endurance.

The motor is the heart of your car, and the life of it. The leaders of motordom have always led on motors. Why should any man buy a fine car now without demanding that motor supremacy?

14,000 Now Running

More than 14,000 Hudson Super-Sixes are now in the hands of owners. You can anywhere learn how men like them. Parts are ordered or on hand for 31,000 more. So there will be no change in the Super-Six so far as we can see ahead.

By quadrupling our output we are now, for the first time, keeping close to the demand. So fine car buyers can now get the car they want.

No Feats Like These Ever Before Performed

All made under A. A. A. supervision by a certified stock car or stock chassis, and exceeding all former stock cars in these tests.

100 miles in 80 min., 21.4 sec., averaging 74.67 miles per hour for a 7-passenger touring car with driver and passenger.

75.69 miles in one hour with driver and passenger in a 7-passenger touring car.

Standing start to 50 miles an hour in 16.2 sec.

One mile at the rate of 102.53 miles per hour.

1819 miles in 24 hours at average speed of 75.8 miles per hour.

Imperial Valley---A Land of Promise.

[Written for Pacific Rural Press by D. N. Morgan, Assistant Professor of Agriculture, Berkeley.]

Never before have prospects for the farmer appeared brighter in Imperial Valley than at present. The speculators have nearly all pulled up stakes and the farmers are commencing to really work their land. The speculator is not needed to keep prices of land up, but the productivity of various places is now the deciding factor when a sale is made.

Land that has been scraped with a disc for all these years is being plowed with almost unbelievable yields resulting. Bermuda grass is recognized as one of the serious problems and instead of trying to sell the land to one who did not realize its effects, the farmers are plowing their Bermuda-infested alfalfa fields and planting crops that require cultivation, thus overcoming its evil effects. This spreading of Bermuda grass has been aided by the system of renting land to dairy and stock men who would pasture exclusively. It is actually looked upon by some, however, as a blessing in disguise, inasmuch as it has forced a desirable crop rotation on the exclusive alfalfa farmer. For years many dairy cows did not receive any feed other than alfalfa in one of its forms. They were profitable in a measure, but now other crops are used in the rotation so that more cows to the acre are being run and the land is increasing in productivity.

Greatest Year Yet.—Cantaloupes have been shipped in greater quantities than ever before. The banner day saw 218 cars leave the valley. All cantaloupes were standardized under the supervision of the U. S. Department of Agriculture. Good prices have resulted. Grapes have been going forward. The frost injury to grapes in the northern part of the State increased the prices of Imperial Valley grapes. The asparagus growers had their most successful year this past winter and spring; and the increasing acreage being prepared for winter tomatoes indicates their profitability. There are more cattle and hogs in the valley than ever before. More sheep were fed this winter than in the history of the valley; despite this increase in livestock 100,000 acres were withdrawn from raising feed and fodder and planted to cotton. The cotton prospects were never better. This indicates that better farming is the order. The plow, once believed unnecessary for best results under desert conditions, is rapidly replacing the disc in preparing land for crops. The manager of one of the leading implement houses in the Valley states that his firm has done more business in the past six months than in any twelve months preceding; that their sales have consisted principally of better farm implements to the successful farmers.

Silos are appearing here and there. Better dwellings are building. The critical period for the man who pioneered in the Valley has passed. He is now able to provide comforts for his family and improve his livestock.

One man, who seven years ago found it necessary to work out for his neighbors in order to secure food for his family, has brought his prop-

erty to such high cultivation that its production has paid off large portions of his mortgage each year for the past three years. Next year he will be out of debt, with his three hundred and twenty acres clear. He, of course, secured his land from the government for practically nothing and it will have taken him thirteen years to pay up for land, improvements, and equipment.

Another case is that of a man who struggled a number of years raising barley and milo, and finally saw that alfalfa and the dairy cow were needed. So well has he planned and worked that today his three hundred and twenty acres is free from debt, his improvements amount to \$25,000, and his gross income from the sale of cheese and sweet cream is better than \$1000 a month. His calves, hogs, etc., are additional revenue. This man has taken twelve years to accomplish this remarkable feat. He, also, received his land almost as a gift from the government and required this time to make it so productive.

Farmers Largest Bank Depositors.

—There are many such successful cases coming to the front now. The bank deposits in the Valley exceed three million dollars and farmers are the largest depositors. Farmers are not trying to unload productive property, but are making long desired improvements, purchasing equipment, better stock, and increasing conveniences for their families. The banks of the Valley, with their very large deposits, are now amply able to take care of the needs of these men who have struggled through these years and have at last acquired property that can be offered for security.

Finances Needed for Strugglers.

But the bank laws do not permit their financing the small man over the critical period necessary to bring his land to full production. There are, however, in the Valley thousands of acres on which men are having a tremendous struggle against odds that did not appear when the first settlers came. They, like their predecessors, have come into the Valley with limited capital, and made the too frequent mistake of paying down on the land too large a percentage of it. Not having provided funds to live on until they could prepare their land and raise their crops, they have been forced to sacrifice their equities, move on to other places as renters or get out of the Valley. For men with adequate capital to purchase and stock their farms, an exceptional opportunity exists today.

Many renters who have had sufficient ability to acquire funds to buy stock after arriving in the Valley, have succeeded in building up their herds and saving a small amount of cash. They are the present buyers of Imperial land and would profit to the utmost if an adequate system of rural credits were put into effect. The community and the government would be farther ahead if these industrious men could be given financial encouragement in the acquiring of a farm home as soon as their thrift and honesty of purpose has been demonstrated. As it is, they

For Growing Bigger Crops

THE better your seed beds the more money you make from the same acreage. The best seed beds are made with **International Harvester** disk harrows, spring-tooth harrows, and peg-tooth harrows. Our tillage catalogues explain fully, but read here a few reasons why these machines give the best field service:

Disk harrows have adjustable snubbing blocks for making the gangs level, and bowed set-lever bars to keep them level when the angle of the gangs is changed. The bearings are especially designed to avoid all unnecessary friction, and make the harrows that much easier for the horses to pull.

Spring-tooth harrows have frames that slide on the ground and keep the cutting depth uniform. They can be used in sod, as well as in wet or stony land, which they are specially made to till.

The all-steel **peg-tooth harrows** are made up of stiff sections, that give the lumps strong action and leave the surface smooth.

These features, and many others that are money makers for farmers, are explained fully in our tillage catalogues, which we send promptly on request. Write for one, and read it over, before you go to the local dealer to see the implement you are interested in. The catalogue helps you to buy right.

must struggle along under conditions that are not conducive to the highest development of citizenship. Their families are not given equal opportunity with their brothers who are employed in the industrial plants of our cities.

Adequate assistance of this nature furnished the farmers of Imperial Valley at this opportune time will make of it an empire little dreamed of by its founders.

TRANSPLANTING BIG PALMS.

To the Editor: How should we transplant palm trees about two feet in diameter to a place three miles away, where the soil is red and gravelly? Can we do anything now to improve that soil for the palms? What time of year is it best to transplant?—E. F. L., Esparto.

[Answered by John McLaren, Supt. Golden Gate Park.]

[Following is the method pursued throughout our work in Golden Gate Park:]

Four to six months before the palm is to be moved, it is prepared for moving by digging a trench around the stem, three feet deep and about four feet from the stem, and the side roots are cut with a sharp instrument. After the roots have been trimmed, a box made of two-inch lumber is placed three inches from the ball of earth. Between the ball and the box this three-inch space is filled with light rich soil. The plant is then thoroughly watered and kept well watered until the time for removal.

In about four months' time the newly placed soil is filled with young roots. As soon as the box is well filled with roots we dig down outside and below the bottom of the box and cut the tap roots and then board up the bottom of the box. In order to protect the leaves of the palm from being broken in the course of its removal, we place four standards, one at each corner of the box, sufficiently long to protect the tallest leaves and place enough braces between the standards to protect the palm. When this work is thoroughly completed, the plant is ready for moving.

When planting in its new situation, the lower side boards of the box should be removed and the top board left on all four sides of the box, so that all water given the plant will be forced to go through the ball, thereby keeping the whole ball moist.

Great care is taken that water in abundance is given each palm for at least a year after transplanting, not only throughout the summer months, but also during the winter, as the space which the roots can reach is very limited and any rain water which can reach the soil through the leaves will be absorbed by the roots much faster than the rain can supply. After the first year, provided the plants are doing well, the new roots reach out and summer irrigation is sufficient.]

[Note.—We transplanted young palms into decomposed red granite soil in Placer county in February, 1914. When seen in June, 1916, the ones that had been watered were in fine shape while two or three not watered were very much dwarfed. We dug holes considerably larger and deeper than the balled roots,

mixed loose dirt with manure in the bottom of holes, set the plants so when settled they were no deeper in the ground than they grew, and protected them from cows with latticed frames.]

BASTARD HOPS.

To the Editor: Are bastard hops caused by improper fertilization, a disease, or are they a degenerate variety? A number of people claim that they are caused by planting upside down.—E. J. P., Los Molinos.

[Answered by H. C. Yandle.]

Bastard hops, sometimes called sport hops, are a cross between a

male and a female; same produce no hops, the bur never maturing. There seems to be no cause for this variety, simply being a freak. From what I can learn from our superintendent, fertilization or planting upside down would not produce this variety of hops.

LIME ON CLAY SUBSOIL.

To the Editor: Will lime of any kind help make underlying clay more porous, thereby helping to keep a young almond orchard from sour-sapping?—E. F. L., Esparto.

Air-slaked lime or ground lime-

stone will be most satisfactory for your purpose in general. Burnt lime or hydrated lime would act more quickly and powerfully, but is more dangerous to trees and burns out humus more. Apply two to four tons of ground limestone or air-slaked lime per acre, before the rains if convenient. It will open up the clay as far down as the water which dissolves it goes. If there is no natural or artificial drainage for the orchard, the granulating action of lime on clay will only open spaces for water and the last state of the soil will be worse than the first.

"I'll Drain that Swamp With Dynamite"

The man who is familiar with the use of dynamite on the ranch or farm finds that it serves many purposes. Not the least of these is the draining of swamp land.

If there is any low, wet land on your place, land that heretofore has been unproductive, drain it with Hercules Dynamite and make it pay its way. You will find that by using dynamite you can do the work more quickly, more thoroughly, and at less expense than by any other method.

HERCULES DYNAMITE

naturally gives as good results when used for running irrigation ditches as when used in drainage work. Until you have tried it yourself or seen it done it is impossible to imagine how quickly a ditch can be run with dynamite. There is no dig-dig-dig about it. A line of charges is planted—exploded by means of a blasting machine—and there's the ditch. Or if the land is very wet no blasting machine is necessary; simply fire the center charge with cap and fuse; it will fire the next one, and so on down the line.

Oftentimes wet places can be drained with one charge

of Hercules Dynamite by shattering the impervious subsoil. This involves even less trouble and expense than ditching.

If you have never used Hercules Dynamite in agricultural work write for our 64 page book "Progressive Cultivation". It is sent free on request. It tells in detail how to drain land; remove rocks, trees and stumps; subsoil; plant trees, etc., by the use of Hercules Dynamite. It is fully illustrated and is well worth reading. When you write please use the coupon below.

GRAIN AND FIELD CROPS.

There was a free-for-all melon fete at Turlock on Sept. 6.

A flour mill for the town of Orland is said to be assured.

The Alfalfa Meal Mill of Orland has practically completed its season. It plans big improvements.

Two new irrigation districts are planned for Glenn county which will water approximately 40,000 acres.

On a late trip the steamer Colusa took two carloads of rice harvesters consigned to rice growers of Colusa and Sutter counties.

Up to the 1st of this month there had been shipped away from the sugar factory of Oxnard 491 cars of sugar and 265 of beet pulp.

The Sacramento Valley Sugar Co. at Hamilton promises to reopen next season if adjacent landowners will put in sufficient acreage to justify the move.

A crop of 48,000 sacks of grain (wheat and barley), valued at \$85,000, has just been harvested by Myers & Kalfsbeek near Arbuckle, Colusa county.

Butte county wheat and barley are selling at record prices this year. Above \$1.63 has been paid for barley, and as high as \$1.85 for good wheat.

A St. Louis company is considering the erection of a \$40,000 kelp-treating plant at Summerland, Santa Barbara county, with a view to the production of potash.

New irrigation projects which would water about 250,000 acres will be taken up at the annual meeting of the Northern California Counties Association convening in Alturas Sept. 25.

The Visalia sugar factory is now running at full blast. The beet growth has been heavy, and the factory is anxious to clean up the crop, as ripe beets standing too long in the ground deteriorate.

The Whitehall Estates have offered to build a sugar beet factory in the vicinity of Tracy if the farmers there will co-operate in raising the necessary acreage of beets to justify the step.

The Yolo Co. rice growers have decided to sell their 1916 crop independently of the Pacific Rice Growers' Association. They have organized as the Yolo Co. Rice Growers' Association.

The Western Canal Co. has surveyors running lines from the present terminus of the ditch in the Dodge Rice Plantation to the Sacramento River near Butte City. Butte City land owners are eager to get water from the ditch.

The Spreckels Sugar Company is constructing at the town of Graves, near Salinas, a new type of beet dump for the benefit of beet farmers in that locality. The device is new there, and is worked by a system of balanced weights and controlled by levers.

The Pacific Rice Growers' Association will pool the rice this coming season, along the lines employed by the raisin growers' association and the California Fruit Growers' Exchange, and will co-operate with the mills of the State toward the standardization of a clean product.

Lima beans in this State are to be five cents a pound f. o. b. the coast until Jan. 1, 1917. This price is announced by the Lima Bean Growers' Association, which controls 1,000,000 of the 1,750,000 sacks estimated to be the State's crop this year.

The Pacific Rice Growers' Association, which maintained headquarters at Biggs last year, is to transfer its offices to Sacramento. It is expected that 2,500,000 sacks of rice will be marketed through this

office. The acreage of rice is estimated as follows: Butte, 30,000; Yolo, 14,000, Colusa, 14,000; Glenn, 10,000; Yuba and Sutter, 8,000; San Joaquin, 5,500.

DECIDUOUS FRUITS.

Buyers are now offering from 5 to 5 1/2 cents for prunes around Visalia.

Buyers for peach-canning interests are canvassing the vicinity of Visalia for next year's crop. They are feeling out the growers for prices.

The Stewart Fruit Company of Hanford has shipped \$80,000 worth of peaches from Hanford and Armona this season—the best since its organization thirteen years ago.

Currant culture in Northern California promises soon to rival rice-growing. Recently inspected samples compare favorably with the Greek importation.

On a single day last week the McNeill & Libby packing house at Selma canned 9,213 boxes of peaches, or about 15 carloads. The hot spell caused rapid ripening of the fruit.

The Sebastopol Berry Growers, Inc., reports that during the past season it handled a total of 2,725 tons of berries. Lawton berries sold for \$75 per ton, Loganberries for \$93, mammoth blackberries \$103, and raspberries \$163.

Horticultural Commissioner Fred P. Roullard of Fresno has filed his report relative to fruit conditions and inspections in his district. During the month 1,872 sugar beet tests were made; 254 samples were condemned owing to failure to reach the 17 per cent standard.

Apricots were light in some sections of Riverside county this year, peaches fair and apples promise to be a good crop according to Horticultural Commissioner D. D. Sharpe. About three-quarters of the peaches of that county are of the canning varieties and about one-quarter of the apricots are sold for that purpose.

Orchardists of New Zealand have formed an association with headquarters at Wellington. The following points have been suggested for increasing the consumption of fruit: (1) High-quality fruit; (2) attractive packing; (3) suitable-sized unbroken package; (4) standard grades of fruit; (5) regularity of supply; (6) prompt delivery of orders; (7) reasonable and uniform price to the consumer.

CITRUS, NUTS, SEMI-TROPICAL.

The shipment of pomegranates from the Porterville district began early this month.

A contract for a new irrigation district to water about 16,000 acres near Lindsay has just been signed.

The warehouse of the Sutter Almond Growers' Association has opened for the season, and many nuts have come in.

The Oakdale Almond Growers' Association is loading its first car of almonds for the season. It is made up of IXL and Nonpareil varieties.

A cannery to be operated by the Northern Calif. Olive Corporation has been started at Palermo. Up-to-date machinery has been installed.

Lemons valued at \$30,000 will be taken from the 41-acre grove of Messrs. Parr & Shippey near Porterville at one picking this month.

Plant Pathologist Ralph E. Smith of the University of California states that Sutter county conditions of soil and climate are excellent for walnut growing.

Greece exported 27,111,467 pounds of dried figs in 1915, as against 17,678,100 in 1914. Of the 1915 exportation the United States received 3,173,374 pounds. The 1915 exports of olives were 19,954 gallons, of olive oil 402,217 gallons,

Oliver Engine Gangs

AFTER YOU have investigated every other Engine Plow made and exhausted every inquiry.
AFTER YOU have reached the conclusion you cannot find an Engine Gang that will handle your difficult conditions.
AFTER YOU have experienced every disappointment in your effort to find a serviceable and reliable plow.
THEN LET US furnish you a plowing outfit that will do your work thoroughly, steadily, reliably, and to your entire satisfaction.

Hard ground or soft, deep plowing or shallow,
Tule ground or grit, foul stuff or adobe,
Rolling ground or level, orchard work or vineyard—

All are within the capacity and scope of the Oliver Gangs.

We make seven
different kinds of Tractor
Plows to suit your
power and soil.

We guarantee
to do what we claim
and do what we
guarantee.

At Your Service. Write, Wire or See Us.

GREEN GOLD RANCH

Route "B," Box 283,
Modesto, California

of which the United States received 18,543 and 262,476 gallons respectively. From the same country the United States received 14,823 tons of currants last year.

The new tract of 475 acres for a citrus experiment station at Riverside is now being made ready. Buildings to cost \$125,000 are now under construction.

The State average condition of lemons is 91 1/4 per cent of normal and oranges 91 per cent, as figured by Acting State Horticultural Commissioner Geo. P. Weldon.

There is being built for the Goleta walnut house a nut cracker capable of turning out 400 lbs. of meats an hour. The annual output of this house is 60,000 lbs. or more.

The Western Walnut Growers' Association, in session at Portland, Ore., has resolved to fight the "unfair competition of unscrupulous dealers who sell Chinese walnuts under the label of the Oregon product."

Indians are harvesting a crop of nutmegs from trees grown at Enterprise, Butte Co. In September the Indians gather the nuts, dry them in the sand, and leave them until January, when they are properly seasoned and ready for use.

Shipments of pistache nuts are soon to be sent from the United States Plant Introduction Gardens at Chico to all parts of the country for propagation purposes. The pistache nut is used for coloring and flavoring.

The Jamison lemon ranch of 160 acres located in the Carpinteria valley, in what is known as Gobernador canyon, has been sold to Santa Barbara citizens. The new owners of the ranch will put out more fruit trees.

A while back some interest was manifest in the injection of cyanide into citrus trees for the purpose of killing scale. Experiments along this line have led to the conclusion that cyanide injection for this purpose is not only impracticable, but is a dangerous procedure.

A strong popular protest is being voiced against the action of the Tulare Co. Board of Supervisors in rescinding the law which requires spraying and fumigating outfits to secure a license to operate. It is claimed that irresponsible operators may severely damage the groves.

The Cal. Almond Growers' Exchange have notified their members that they must deliver their shelled and unshelled almonds to the Exchange, without sorting or separating, but in original condition. "Stick-tights" of shelling quality must be delivered clean. They will be pooled and returns made accordingly. Almonds will not be received unless thoroughly cured.

The California Associated Olive Growers have been permitted to sell 40,000 shares of its common stock at par, \$5 per share, and to issue 20,000 shares of its preferred stock at par. It has in view a plant in the Fair Oaks district, one at Palermo, and a third at Fallbrook. Crop contracts call for minimum payments of \$37.50 per ton for pickling olives, and \$12 a ton for oil olives.

According to the report of commissioner Sharpe of Riverside county citrus growers there have the best prospects for a heavy crop the coming season that they have had for years. He says that they are still bothered some with black scale, but that fumigation has been general and that orchards are getting back to normal, the first time since the heavy frosts of a few years ago. By next year he expects the county's yield to be where it was before the freezes.

Aphis has bothered walnut growers in Santa Barbara county more this year than the blight according to Secretary Doolen of the Goleta Walnut Growers' Ass'n. The association has installed a new cranking machine this year that is guaranteed to crack about 80 per cent halves. The bleaching apparatus also been improved by the installa-

tion of new machinery which blows the spray on the nuts instead of the old method of immersing the nuts in the solution. Last year 61,000 pounds of meats were marketed by this branch of the State association.

GRAPES.

The raisin-making season has begun in Yuba county, and will last for several weeks. The yield per acre is fair.

Fair weather has started grape-picking in the district roundabout Dinuba. The quality of all varieties is good and the sugar content high.

A reduction of 40 cents a ton on carload lots of raisins and dried fruits between valley points and San Francisco has been announced by the Santa Fe. The new rates apply on intra-State shipments only.

The wineries at El Pinal, Mokelumne, Victor and San Joaquin near Lodi opened this week for grape-crushing. Growers are offered \$12 per ton for grapes averaging the required 23 per cent sugar content.

The Santa Clara Co. Grape Growers' Protective Association have sent a protest to the Conference Committee of Congress on the House revenue bill against the wine tax in this bill as amended in the Senate, which they claim will ruin the industry.

MISCELLANEOUS.

The California Public Employment Bureaus filled 20,962 positions during the first six months of their existence.

The first piece of paved highway in Ventura county has just been completed. It lies between Santa Paula and Fillmore.

The cities of Sacramento, Stockton and Fresno are making strenuous efforts to secure each in its own city the location of the Rural Credits Bank to be established in the Western division.

The city of Fresno has been granted a permit to use a 15-acre camp in the Sierra National Forest where it is planned to provide low-cost camping for schoolchildren and their parents.

The Pacific Gas & Electric Co. is to add 35 feet to the height of its 225-foot dam in South Yuba River at Lake Spaulding. Before winter it is hoped that another 33,000 h.p. initial power may be harnessed.

Representatives of most of the States met recently in Washington at the invitation of the U. S. Office of Public Roads to criticize and revise regulations under which the new Federal appropriation for roads will be administered.

With the passage of the appropriation of \$75,000,000 by Congress for the building of good roads interest in road development has been aroused anew. States accepting the benefit of this act must appropriate amounts equal to those received.

The Diamond Match Company of Chico is building a new warehouse a block long for bee supplies alone. The company already has a big warehouse. Beekeepers' supplies will be made from the company's own timber. The latest automatic machinery has been installed.

It is reported that a royalty of 12 1/2 cents a wet ton has been offered the board of supervisors of Santa Barbara county by the International Potash & Fertilizing Co. for kelp cut off the Santa Barbara coast, which would mean a revenue of \$25 a day, or \$7,500 a year, on a proposed cut of 200 tons a day.

C. R. Rookwood, engineer for the Imperial Valley Irrigation District recently submitted a report showing that more dredging had been done in the seven months January to August than in the seven years it was under receivership. Heavy silt had been getting ahead of the receivers, who with their attorneys drew surprising salaries.

It practically has been decided that all managers of Federal irrigation projects, all engineers in charge of reclamation work and all heads

SEE THE TRACKLAYER at PUENTE DEMONSTRATION

See them in actual operation and verify what we say about the compact flexibility of the **TRACKLAYER**.

Look well into the "All Steel" construction of these tractors and note that together with this feature of high grade materials we have embodied simple sturdy design.

See the ease with which the **TRACKLAYERS** are operated and do not overlook the fact that the different models are the most powerful tractors for their size on the market.

Ask our representative to demonstrate the "Rocker Joint" that eliminates friction between the track links—and the "Oscillating Tracts" that conform to the uneven contour of the ground.

The little **TRACKLAYER** for orchard cultivation will be there as well as the big **TRACKLAYER**.

See the line of tractors that are built for "Service" with "Minimum Up-keep."

The Tractor Demonstration at Puente.

[By Sec'y W. L. Cleveland of the Los Angeles Traction and Implement Dealers' Ass'n.]

From the time that the starting gun is fired at 1 o'clock Tuesday, Sept. 19th, until the sun sets on Saturday night, the 23rd, there will be something doing all the time at Puente.

A great demonstration of tractors and tractor-drawn machinery such as this will be, has never yet been held in California. Last year a demonstration of this class of machinery was pulled off at Farmington, near Los Angeles, in a small way, and proved vastly interesting to the few thousand people who were privileged to attend. This year, however, dealers in traction engines and heavy machinery have organized an enthusiastic association, and are going to pull off a demonstration that will be of particular interest to every man and woman, either owning or operating farm lands or orchards.

This is to be a demonstration pure and simple, and no contests of any kind will be held. It is the purpose of this gathering to show to the farmer and orchardist the various sizes and types of tractors and tractor-drawn machinery, and to demonstrate that they are adapted to their use. Traction manufacturers and dealers realize that the successful use of this machinery in Southern California will depend upon its being adapted to the various kinds of work to be performed, and hence it has been arranged so that, at the Puente gathering, opportunity will be afforded the interested farmer or prospective buyer, to see these machines operating at different kinds of work, such as plowing, disking, cultivating, subsoiling, etc.

Demonstrations have been held this year in a large number of Eastern counties; and the attendance at these gatherings has averaged more than fifty thousand. What has been done elsewhere it is hoped to repeat at Puente, where it is confidently expected there will be a gathering of not less than twenty thousand.

An opportunity will be afforded for a close inspection of the mechanical construction of the various machines that are shown, together with accessories of every kind which are expected to be exhibited on the grounds, such as carburetors, magnetos, spark plugs, etc. All these things are helpful and are of particular interest to possible buyers. One thing should be carefully considered by every farmer or orchardist before buying, and that is the size that is best adapted to his services. There is no use of buying a big, heavy machine to do light work, and it would be equally foolish to buy a light machine for heavy work. The careful buyer should make an estimate as to the work he expects a machine to do, and then buy a tractor with that end in view.

The program for the demonstration at Puente provides for private demonstrations of tractors and machinery during the forenoons, during which time the managers of the different machines on exhibition will operate the various tools, to show what they can do. Exhibition of short turning, harrowing of loose ground, disking, etc., will be given during these morning hours.

At 12:55 every tractor that is to

be shown in the plowing demonstration, will be lined up on the land assigned to it, for the afternoon work. At 1 o'clock, upon the firing of a gun, the entire line-up of 20 or more machines, will begin plowing, and will continue to do so until 3 o'clock, after which, for thirty minutes, an opportunity will be afforded for the inspection of the machines that have been in the demonstration. After this inspection, the tractors will be taken to the headquarters of the company being represented for either further inspection or private demonstration.

It will thus be seen that every opportunity will be afforded to witness the operation of various tractors, under different conditions, and in connection with tools of various

kinds.

For the comfort and pleasure of the inner man, a restaurant will be provided on the grounds, where first-class food can be had at the right price.

Every man or woman who, at any time, anticipates being in the market for a traction machine, or is, in any way, interested should plan by all means to be at Puente.

The following firms (a partial list only) will exhibit at the Puente Tractor meet:

Killefer Mfg. Co., one 5 Standard Subsoil Plow, one 3 Standard Subsoil Plow, one 1 Standard Subsoil Plow, set of Double Tractor Discs, one 4 Bottom Extra Heavy Mold Board Plow, one 2 Bottom Extra Heavy Mole Board Plow, one Tractor Chisel Cultivator, one Tractor Orchard Cultivator.

Bates Steel Mule Co., one 13-30 Steel Mule.

Holt Mfg. Co., one 18 h.p. Cater-

A. F. George Co. entering 1 Yuba 12 h.p., 1 Yuba 18 h.p. Full line John Deere Implements, Alpha Sprayers, 3 sizes Schmeiser Land Levelers, 1 Hart-Parr Wheel Tractor and full line of Keller-Thomason Irrigation Equipment.

International Harvester Co., entering Mogul Tractors and line farming implements.

Entries closed for this demonstration on Sept. 5th. It is more than likely that several other firms, selling tractors, farming implements, irrigation machinery, etc., will be represented at this meet, and all exhibitors will be announced in our issue of September 16th.

20 PERCENT FARM DYNAMITE.

It used to be that the man who blasted out stumps thought he was doing well to get the most condensed and most powerful explosive he

could find. A great many people still think that the standard dynamite or powder for this and all other farm purposes is what is usually called "40%." But experience has shown that there are other considerations much more important than the "strength" as indicated by the percentage of nitroglycerine.

For blasting out stumps, except in the light, dry, sandy soil, you will get much the best results with a 20 per cent powder. And if it is an ammonia powder instead of a nitroglycerine one, the results will be better yet. As compared with the work of other powders or dynamites, such as 30 per cent, 40 per cent, 60 per cent, or 75 per cent, the finished result will cost you less money, and the job will be done in a superior manner. Contrary to what one would think, from the figures, the 40 per cent is not twice as strong as the 20 per cent. In practice you can use them stick for stick, or with not over 10 per cent more of the 20 per cent powder.

Twenty to 25 per cent ammonia powder is the thing to use in all tillage blasting—for trees or for regular farm crops. Its gas action is superior for this purpose to that of 40 per cent or other grades.

On the other hand, for making ditches, 50 per cent is best. Where the propagated method of detonation is used, nitroglycerine powders are best because they are more sensitive. But if an electric blasting machine can be used for all or part of the charges, 50 per cent or lower ammonia powder is the best grade to buy.

For breaking big stones 50 per cent should be used. The lower percentage powders do not have quick enough action for this purpose.

As it happens now, owing to the war in Europe and other causes, the ammonia powders are much cheaper than those with a nitroglycerine base. The 25 per cent ammonia powder sells now at \$13.75 per cwt. while the nitroglycerine powder of equal strength but greater speed, sells at \$16.75. The 40 per cent nitroglycerine explosive sells at \$3.75 per hundred more than the same strength of ammonia explosive.

The "propagated method of detonation" mentioned above means that high percentage powder is used in a number of separate holes with a cap to set off the charge in the first hole only. One experienced man has set off 100 such charges placed three feet deep in mud in holes made with a shovel-handle 18 to 24 inches apart. In one case in Monterey county it threw the dirt 250 feet from the ditch being opened.

TRACTOR FOR BEANS, HAY ORCHARD.

[Written for Pacific Rural Press.]

"I would investigate the motor of a tractor first, if I did not know the various makes," suggests R. L. Owen of Los Angeles county. "Then I would find out how much it would pull, for there is not much uniformity in the meaning of tractor horsepower, and the rated horsepower of the engine is only a general indication as to how much the tractor will pull."

After investigating the engine and traction, he would look over the general construction and material used in the tractor. "I want to see if it

transmits its engine power to the draw bar economically, and if the material is strong enough without being too heavy. All surplus weight takes part of the engine horsepower to move it.

"We have used a 30 h.p. tractor one year to work 300 acres of beans, 120 of hay, and 80 acres of orchard. We find it very economical and ef-

ficient; but we keep six horses for planting, cultivating, and harvesting hay. We use the tractor for all kinds of work, including plowing, working down, and hauling.

"Our repairs have cost us less than we expected—\$34 during the running season, and \$62 for overhauling at the end of the season. Have had no trouble with bearings.

Prefer gear transmission entirely. I should say that a track type tractor is very satisfactory."

POWER NOTES.

A gas engine was mounted on the rear platform of a Schmeiser power land leveler drawn by a tractor in a hurry-up job of leveling on the Fair

grounds. The engine worked the air compressor which raised and lowered the scraper.

C. H. Burman of Oakland recently drove a Hudson Super-Six from Broadway to Broadway over the Skyline Boulevard entirely on high gear. This includes several steep "hairpin" turns and a long hard grade.

ONE MAN AND "BATES STEEL MULE"

FOR EVERY FARM
OPERATION

Bates Steel Mule Company
OF CALIFORNIA
320 N. San Pedro Street
LOS ANGELES, CAL.

COME TO PU-EN-TE SEPTEMBER 19-20-21-22-23 AND SEE THE BIG TRACTOR DEMONSTRATION

THIS demonstration has been arranged to help you solve the problem of better and cheaper farming.

It will be a liberal education in efficient farming.

You will learn how and why tractors make farming more profitable.

You will have an opportunity to see for yourself the actual performances of the different makes and the different classes of tractors—as well as all kinds of farm machinery.

Mechanical power has been applied to the factories of America—making America the greatest manufacturing nation on Earth.

Mechanical power is now being applied to the farms of America—it will make America the greatest farming nation on Earth.

It is your duty—the duty of every farmer—to do your share toward reducing the high cost of living, and to cut the cost of living you must cut the cost of production. This demonstration will show you how to do it.

Come to Puente. There you will see in operation the biggest array of farm machinery ever assembled in California.

Reduced fares on all railroads.

PU-EN-TE

Twenty miles east of Los Angeles on the Main Valley Boulevard, Southern Pacific, Pacific Electric and Salt Lake R. R.

Don't miss this Big Event
Sept. 19, 20, 21, 22, 23

State Fair Tractor Demonstration.

Hot Weather and Hard Ground Did Not Worry the Tractors, Though No Stop Was Made at Dinner Time, but Most of the Plows Were Not Equal to the Task. It was a Capital Chance to Compare Merits and Learn Advantages.

(Written for Pacific Rural Press)

The visitors broiled in their shirt sleeves, but the tractors didn't mind the hot weather at the State Fair Tractor Demonstration Sept. 4. We were invited to hold our hands on the radiator of a Bates Steel Mule for two minutes. We didn't want to, but it wasn't much hotter than we were, after it had plowed several rounds. Its driver sat on the plow, safely behind this Mule's heels.

The ground hadn't been plowed for eight years, but the 75-35 Best tractor forgot about that and broke the cable to the plows twice. It was repaired both times, so it broke the drawbar next, and then stopped to see what its fellow tractors would do.

The plows, most of them wouldn't cut through the surface crust only intermittently, but the Big Bull acted like there was a red rag cavorting around in front of it, and we thought that with less unseemly haste, it might have made a deeper dent in that brick-like ground. People said, however, that because they had not been allowed to find out about the field, their plows were not adjusted right.

The Invincible and Paragon walked along with their plows until the demonstration started. Then they balked temporarily and quit early.

The 75-40 Caterpillar wasn't so frisky, but with the grim determination of Fate, striking awe to the visitor's heart, he grunted along with 15 disks, each cutting ten inches and doing a good of the deep

plowing without becoming winded.

The Yubas were both frisky and nonchalant about the way they turned over their dirt as if it were a before-dinner job. (The demonstration started about noon). Their disk plows, like the Davis plows, following the Caterpillar, were built for the conditions, and caused much favorable comment.

The Samson Sieve Grips didn't look much bigger than a minute, for they were close to the big 75-40. They didn't even choo-choo very stridently, but there were no flies on them, and they asked no odds of anybody. They were in the game to the end and didn't sweat a hair.

The big Sandusky didn't pack the soil with its wheels 30 inches wide, but loosened soil for the plow by digging it up more or less with the long pointed grousers. This machine wasn't sorry it came all the way from Ohio, for though the soil is different, the Sandusky was as game as any.

Plowing Only.—The world seems to have gone mad on plowing at tractor demonstrations. Plowing alone was allowed at the noon exhibit of mechanical tractive power. Probably it was because this is the best and most universal way to determine the relative strength of different machines. But when you draw conclusions from such a demonstration, consider the number of bottoms, watch how deep they go, and see whether the leader of a gang

is going as deep as its rear companion. We did not notice any of the last mentioned tricks-of-trade, but there was a difference in the average depth plowed, and considerable stretches were merely scraped over. This, however, was due to the hard-heartedness of the ground rather than to efforts to save power.

More Varied Uses Should Have Been Shown.—But we had been told by half a dozen different manufacturers, that the consideration which would make the difference between loss and profit in the use of a tractor on the farm, is the numerous use it could be put to after plowing is done. In spite of this, these same manufacturers did nothing else so far as we observed, except spectacular stunts which truly proved the flexibility and power of their machines. These stunts suggested nothing by which a farmer would be able to supplement his plowing in order to make a tractor a profit-making investment. Such uses there are and their name is legion; and many of them will be demonstrated at Puente Sept. 19-23.

Parade.—The Tractor Day started about 10 a. m., with an elephantine parade twice around the Fair grounds, of tractors totaling 318 drawbar horsepower and 650 h. p. on the belt, as figured by L. J. Fletcher, who assisted Prof. J. B. Davidson of the Power Department at University Farm in supervising the demonstration. Among them was the youngest baby elephant, the 6-12 Bean Track Pull. The biggest part of this machine is its track. Its engine clings to one side at the front end of the track while the radiator clings to the other side. The machine is guided by an operator sitting above two apparently over-heavy spraddled-

out wheels, who simply turns the whole machine with a hand wheel, and the rear wheels follow. It is a surprisingly lusty infant, but did not take part in the demonstration.

Life of Tractor Unknown.—An interesting feature is that the life of a tractor is principally an unknown quantity. The California-made machines have not been in the field long enough to furnish definite data widespread enough to determine a fair average; while the Eastern-made ones put this aside as one man did, by saying that the past few years have shown the weak points in materials and construction, so that the lives of the recent models will be far greater than those which have already been in use a few years.

And the life of a tractor cannot be measured in years any more than the number of furrows it will turn at once indicates its power. The life of a tractor is the number of days and nights it is profitably used until the multiplicity of parts to be replaced shall eat up all profits. And the profit from a tractor will be much greater if such number of days and nights can be found in the fewest number of years.

The Power of a Tractor is displayed by the number of inches of plows it will pull at a given depth and considering its speed. The number of acre-inches per given time shows its relative power, soil conditions being equal.

Consider Varied Soil Conditions.—But the power and life of a tractor are not all. Its ability to be used under all farm conditions will determine its relative value, other things being equal. In a plowing demonstration like that at the State Fair on hard ground, orchard trac-

Doing double duty with a YUBA

There are times when the days are not long enough on the farm—when the ability to do night work means all the difference between a seasonal loss or a seasonal profit.

The tired horses cannot work two shifts a day, but the right tractor can. Some farmers do not work their tractors nights because even a slight breakdown means leaving the tractor stand until daylight.

The Yuba Ball Tread Tractor—substantially and honestly built—works right through until morning.

There is no carburetor trouble on the Yuba. The carburetor can be adjusted, from the seat, for the cooler and heavier night air.

Sometimes night operators find adjustments troublesome, but not on the Yuba. There are only 5 grease cups to watch.

Doing double duty with the Yuba in the cool damp night air—That is something to look forward to.

THE YUBA
BALL TREAD TRACTOR

THE YUBA CONSTRUCTION COMPANY

433 CALIFORNIA STREET, SAN FRANCISCO

tors had little opportunity to show their value. The ones that showed up best here might be of less value in an orchard or on a farm where occasional soft or slippery spots need drainage. This is not minimizing the value of such a demonstration, except that it did not adequately represent the uses or varied conditions for which tractors are valuable.

Among the 700 or 800 visitors who inspected and followed the various tractors on their rounds, were a large number who had come long distances to the Fair largely to make up their minds which tractor would do their work most economically. One man with a ten-acre vineyard, in which he works two horses 60 days per year, came to learn whether he could invest in an iron horse which will not have to be fed in idleness five times as many days as it is worked.

Operators Questioned.—There was no lack of questions fired at operators and demonstrators whenever the machines stopped (not for a breathing spell). And there was utmost courtesy and full information in the answers.

But with all this, one of the most valuable features of the demonstration was the lecture by which one man pointed out the advantages of his machine, and showed visitors some of the unsuspected features which would have otherwise escaped their observation and questions. The value of these lectures ought to be equal, to both the manufacturers and visitors.

Plows Needed Adjustment.—The farmers at the Fair noticed and remarked on the good plowing done by two of the machines. All of the tractors were in fine mettle, but some were handicapped with plows not adjusted for hard ground. Representatives of the two which did highest class plowing, agreed separately on the points that disk plows for hard ground should be set more nearly square with the line of draft and more nearly vertical, than the others in the demonstration were used. Moldboards seemed not to do any better work than disks in this soil, where not a moist inch of dirt was turned. Weight is of less consequence than adjustment.

Entrants in the demonstration were: Bates Steel Mule 30-13, operated from a three-gang moldboard plow; Sandusky 35-15, pulling three moldboards; Best 75-35-50, which would have pulled 18 disk plows; Best 45-20, pulling 5 disk plows; one Big Bull with 3 disks; an Invincible with 3 disks; a Paragon with 4 disks; a Yuba 20-35 with 6 disks; a Yuba 12-20 with 5 disks; a Caterpillar 75-40 with 15 disks; a Caterpillar 45-20 with 6 disks, and a Samson 10-25 with three disks.

Southern California Demonstration.—Many of these machines will be at the Southern California Traction and Machinery Manufacturers' demonstration Sept. 19-23, and will run not only plows but subsoilers, pumps, and other machinery, to show the capability of tractors for increasing farm profits.

The Holt Mfg. Co. had a self-propelled combined harvester with 55 h.p. motor and track, ready for the State Fair; but a hurry-up order took the machine too soon.

Make Your Own Comparisons

You have read tractor advertisements—you have studied tractor catalogs. Now, at the big tractor demonstration at Puente, near Los Angeles, Sept. 19 to 23, you may see the machines engaged in actual work. Compare them there, side by side.

See how far superior the Caterpillar is, in construction and design.

Note its ease of handling, its simplicity, its complete accessibility.

Study the features that made this tractor Grand Prize winner at

both 1915 Expositions. Learn how motor power is turned into pull,

in the Caterpillar, with least frictional loss—how soil packing and miring are made impossible.

Then Make This Further Test:

We know you will be convinced that the Caterpillar is superior if you compare it, point by point, with other tractors. But still surer proof of a tractor's merit will be found in talking with the owners and operators of the machines.

Caterpillar owners will tell you that this tractor is built for service, that it will work in any season, regardless of weather or ground conditions, that its fuel and upkeep costs are light.

There are more than 1200 Caterpillar owners in California alone—let us give you the name of the one nearest you. Or, if you haven't read the Caterpillar Catalog, send for it today.

Users of tractors, engines, pumping plants, motor trucks, automobiles, electric motors, and other mechanical farm power are invited to make this department an exchange of your experiences and troubles.

AUTO—TRACTOR—CORN SILAGE.

[Written for Pacific Rural Press]

A visit to the Capital Dairy will convince anyone that Albert Meister is a progressive dairyman. Year by year he has added improvements to his plant until it is one of the most complete and up-to-date in the country. His barns are models of lighting and ventilation, with concrete floors and the latest sanitary

First a Crop of Rye was Harvested. devices. His clarifying and pasteurizing plant is right up to the minute.

Yet it was only a year ago that he adopted the feeding of corn silage. It can hardly be regarded as a discredit to the man, to say that he was so taken up with the problem of furnishing the best and purest milk possible to five thousand or more of Sacramento's families that it required a hard jolt to direct his mind

never taken much stock in the idea. Like many others, he had been firmly of the opinion that corn couldn't be successfully grown in California. However, as no other solution of his feed problem presented itself, he decided to investigate the corn proposition.

His good auto quickly took him to the corn sections he had read about. He was sufficiently convinced so that on his way back home he ordered a 30 h.p. Caterpillar and immediately started breaking up the worst of the alfalfa land. He put in 40 acres of corn. Though planted so late, most of the corn made silage, cutting about 500 tons. By the time it was ripe, four Ideal Green Feed Silos were up ready to receive it. Thus he proved to his satisfaction that corn could be raised in California—and on his place.

He now decided to test its feeding value. Only a part of the herd was fed silage. Each string of 28 cows received per day 780 pounds silage and 300 pounds hay. The strings not fed silage received 900 pounds of hay per day. All were fed a mash consisting of 100 pounds beet pulp (or alfalfa meal), 80 pounds ground barley, 60 pounds bran, and 30 pounds oil cake meal for each string. The hay fed was first-class alfalfa. Not only did feeding the silage save over 60 per cent of the hay, but the silage-fed cows gave decidedly more milk and came through the winter in decidedly better shape than the others.

Mr. Meister is now enthusiastically converted to corn silage. This year he has made provision for 30 pounds per day for every cow in his herd during the dry feed season. Four additional silos of the same make as the first, but larger, are being put up, almost tripling his capacity; and to fill them he is growing 80 acres of corn that will compare favorably with the best in the corn belt or anywhere else, for that matter.

Then a Crop of Corn was Grown the Same Season.

to his feeding problem.

That jolt was given last June when his faithful alfalfa fields, which had for the past seven years yielded six or more good crops per season, suddenly gave out and threatened the food supply of his army of four hundred black-and-whites. He says that he had read a good deal from time to time in the farm journals about growing corn and the value of corn silage as a dairy feed, but had

Last season he had no time to do more than break up the ground and get in the seed. For this season's crop, the ground was well manured during the winter and treated to a ton of lime per acre. A big crop of barley was first raised, and as fast as this was cut, for green feed, the corn was put in. The planting was done at intervals through April, May, and June. About a ton of seed was put on the 80 acres, the principal

Layne & Bowler PUMP

Gives Absolute Protection

The Layne & Bowler pump is constructed to stand constant wear, to work perfectly without trouble under every condition. This insures you against an insufficient water supply. This pump has been subjected to the most severe tests and has proven beyond a doubt its superiority. The final choice of discriminating ranchers is invariably the LAYNE & BOWLER SYSTEM. We can show you how you can save the greatest amount of money, produce a larger supply of water, and eliminate all pump trouble. Consult with our Engineering Department. Let the world's largest water developers solve your pumping problems.

varieties being Improved Leaming, and Pride of the North. The seed was Eastern grown and was obtained through the Valley Seed Co. His first planting will be ready for siloing by Sept. 1. It is 10 feet tall and looks like 20 tons per acre.

Mr. Meister figures that two years of barley and corn will kill out the Bermuda and get the ground in good shape to go back into alfalfa. He has planned his rotation so that he will have 100 acres of corn every year.

REQUIRED TRACTOR TO PLOW MELILOTUS COVER CROP.

[Written for Pacific Rural Press.]

Melilotus indica has not been so thoroughly tried out north of Tehachapi as south, but where it is properly handled, great satisfaction results.

Among the best of these that we know about, is that of A. Neilsen on the S. F. Leib ranch in Santa Clara Valley. It averaged 3½ feet high, a thick stand on 10 acres of walnut orchard when worked down with tractor and double disk. Efforts to get it turned under failed.

Last September or October, furrows were plowed through the orchard 38 inches apart. They were too deep so they were harrowed lengthwise. Then the melilotus was broadcasted by hand, about 10 pounds of seed per acre. It was mixed with about ¼ its bulk of dry beach sand for convenience in sowing. Part of the seed was wetted and mixed with one-fifth its weight of blood meal, but no results were noticeable. Part of it was mixed with one-fifth its weight of air-slaked lime. This did "lots of good."

Irrigation was given once in the fall. The melilotus came up, but didn't grow much above ground, until February—then it shot upward to an average of 3½ feet. Some stalks were as big as your finger and tough.

Working it down was a two weeks' job. The furrows made and harrowed down in October, made a gang plow out of the question. Mr. Neilsen aimed to plow when the melilotus was half in bloom—it was in full bloom before the job was done. A little of it was plowed with four horses, but that "wasn't satisfactory. The 30 h.p. tractor was tried with two plows hooked on by a chain. "You would need a sulky 30 inches high to turn it under."

Finally, the tractor worked it down with a double disk; and it never was entirely turned under, except by later cultivations. It was found here that the roots went only 3 to 5 inches deep, though there were lots of them and lots of nodules.

POWER NOTES.

Stratford, Kings county, sugar beet growers hauled several hundred tons of their crop to the cars by auto trucks.

The Samson Iron Works of Stockton has sold all of its property, patents, accounts, etc., to the Samson Sledge-Grip Tractor Co., a new corporation formed to add new equipment and increase the number of their employees from 200 to 300.

Distillate for auto truck fuel proved satisfactory for several machines used by a San Francisco draying concern. Their drivers are reported to have used it several weeks

on Federal trucks thinking they were using gasoline.

Of 9688 people who visited Yosemite Valley this season prior to July 1, 5623 came in their own automobile stages.

A dynamite manufacturer was recently arrested in San Mateo county for not blowing his horn at the turns of a Honda mountain grade.

COST LESS

Even though Racine Horse Shoe Tires sell for considerably less than other tires of comparatively the same high quality, they are guaranteed for 5000 miles.

Note the unique tread. The anti-skid horse shoe cups are sunk into the tread—not elevated. When the cups eventually wear smooth there remains a thickness equal to a plain-tread tire.

The Utility End of a Purebred Farm.

[Written for Pacific Rural Press.]

No dairy cattle breeding farm, regardless of the quality of its livestock, can lose sight of the utility end of the business; in fact, it is the added revenue from the commercial dairy side of such farms that makes dairy cattle breeding a better poor man's business than some other forms of livestock breeding, because of the early and continuous income.

On the Rio Vista Holstein Farm in Los Angeles county, owned by Col. Ben. Rhoades, this fundamental point is never lost sight of, even though the chief consideration is to breed and raise high-producing Holsteins that will meet favor for their breeding qualities.

There are two departments on this ranch, one busying itself in the breeding and record making work while the other confines its work to the growing and storing of feed, and the care and disposal of the milk.

The former is the more spectacular because of the continual effort to secure higher records than have ever been made before. The best indication of success in this respect is the fact that of the 45 mature cows on the ranch, three-quarters of them have A. R. O. records ranging from 19-pound two-year-olds to 31.8-pound four-year-olds.

The natural location of this ranch greatly facilitates the growing of feed, and the drainage problems; as there is enough acreage on high land for all the necessary buildings, and the balance of the land is rich river bottom on which large yields are the rule.

The problem here, as on other dairies which operate on high-priced land, is to raise the maximum amount of feed on every acre. Alfalfa has constituted the chief feed grown on this river bottom land in the past; but none too favorable conditions, together with the belief that better results would be attained by growing corn for silage and buying alfalfa hay, has led to the planting of a considerable acreage to corn and the erection of two brick silos the past season.

Corn planting was done June 1, and by the middle of August the growth was fully 10 feet high in many places and averaged well over nine feet. At that time thorough cultivation and two irrigations, one at tasseling time and another about two weeks later, had been given, the dirt being thrown well up to the stalks when furrowing for irrigation, which overcame the possible toppling over of the heavy stalks.

The two silos built this year are an innovation; both of them being made of brick, 14 feet in diameter and 60 feet in height, but well anchored by being set several feet in the ground.

Reinforcement of each layer of brick has been accomplished by the insertion of No. 4 iron wire in very rich cement mortar, around each course for about half the height, and the use of No. 6 wire in the higher courses where the strain is not so great. It is interesting to note that these two silos were built at a total cost of \$850 by a local brick mason.

The milking barn is of the type characteristic of Southern California dairies where whole milk is marketed, having a well-drained concrete floor with roof overhead, but open sides. Because of the almost continuous test work, an adjacent building is used for a test barn, with a box stall capacity of 16 cows.

The milk from the dairy is sold through the Milk Producers' Association of Southern California, of which Col. Rhoades was one of the organizers, the prices received as a result of this co-operation being much better than had previously prevailed.

Owing to his auctioneer business demanding most of his time Col. Rhoades has leased his ranch and expects to disperse his purebred herd at public sale in October, but the ranch will continue to be the home of high-class Holsteins. Messrs. Anderson and Daly expect to establish a large herd of purebred Holsteins on it, and another ranch located at Burbank.

Alfalfa Meal vs. Chopped Alfalfa.

To the Editor: What are the relative advantages and disadvantages of finely chopped alfalfa and ground alfalfa meal? The chopped alfalfa is not usually over 1/4 inch long.

[Answered by Prof. F. W. Wolf, University Farm, Davis, Cal.]

The same advantages and disadvantages would apply to a certain extent to both fine-chopped alfalfa and alfalfa meal, and the finer the alfalfa is chopped, the greater would be the similarity between the two products. Alfalfa meal is used largely for feeding poultry and swine, and in the manufacture of mixed molasses feeds. It has an advantage over chopped alfalfa for poultry and perhaps for swine, but in mixed feeds or as a component of the grain mixture for dairy cows, steers or sheep, there will be no advantage in grinding the alfalfa over chopping it.

The main disadvantages of alfalfa meal are its dustiness and cost, and the fact that it is difficult, or next to impossible, to determine its quality by a mere inspection, without

chemical or microscopic analysis, and to tell whether it is made from a choice quality of leafy alfalfa hay or from an inferior grade of over-ripe, stemmy alfalfa. The mere grinding or chopping does not add anything to the digestibility or the feeding value of the hay, but it insures its being eaten without waste, and there is also some advantage in the case of both feeds over alfalfa hay in the saving of storage room.

MULTIPLYING GOOD TYPES AND PROLIFICACY.

To the Editor: In support of your claim on page 203 of the issue of August 26, that "propagation should be only from the best trees" in type and bearing, I wish to cite the experience of Mr. Butcher of Sunnyvale. He says positively that in regard to cherries (his specialty) the propagators have for years been breeding down, by getting buds from vigorous wood producers, with no reference to the fruit. He proves

Growing Large and Medium Sized Hogs.

(Written for Pacific Rural Press.)

Because he had a chance to com-pare the growth of a barren pure-bred sow with that of a barren grade sow about the same size, Wm. Bern-stein of Kings county decided about seven years ago to raise purebred swine instead of feeding his bakery refuse and stale bread to scrubs.

Since then his hog establishment has literally taken the 40-acre farm, for practically all of the feed grown on the place is sold in the form of roofs. These provide plenty of registered hogs.

Fifteen acres are seeded to alfalfa, the balance being cropped to corn, summer crops, and grain hay.

The hogs are run on the alfalfa pasture in pens about 32 feet wide and 200 feet long, equipped with home-made shelters constructed out of fence posts and thatched straw space for exercise; and by grouping the various sized pigs into separate pens, the room required for the hog lots is not excessive.

Self-feeders have been satisfac-torily used with young growing pigs, rice middlings, tankage, barley, corn, bran, shorts, salt, and charcoal hav-ing been used. To sows and younger pigs the grain ration is fed in the form of slop, barley being the chief feed used. When fed to sows with pig, about a bucket of soaked barley to seven sows is the usual daily al-lowance, experience having shown that sows fed a grain ration have

much stronger pigs than those de-pending solely upon alfalfa.

Poland Chinas are the breed grown on this ranch, and while both the medium and large types are kept, the preference is for the large type; because a comparison of growth in the two types on this ranch has shown more pork at the same age for the larger type.

Mr. Bernstein does not believe in the extreme large coarse type. He believes that it is possible to get a more refined large type by selection, similar to the present-day medium type, having good hams, smaller head, and being more prolific. He also argues in favor of the larger type because he believes they can be held more profitably after arriv-ing at the preferred market size. That is, the larger hog can be kept growing even though the market is off for the time being, while the medium type is more apt to have gained almost his maximum weight and must either be sold on a poor market or held at an added expense for feed, labor, etc.

The Alpine Evaporated Cream Co. are remodeling their old Hollister plant with the intention of opening it this fall. They already have be-tween 25,000 and 30,000 pounds of milk daily guaranteed them. At their Gonzales plant they are han-dling 140,000 pounds of milk daily, secured from the district lying be-tween Chualar and San Miguel.

THE BOSS'S PIG-FEEDING EXPERIMENT.

By "Hired Man," Kern County.

My boss is a big grain miner,—I mean farmer. He does a good crushed barley business, for he isn't pressed for money, and can afford to hold. But last fall his big granary full of crushed barley got infested with small red beetles, which increased so during the winter that it seemed likely the boss would find his barley all turned into beetle meat before he could use it any other way.

He is a rustler, though, and bought a few hundred thin hogs of all ages, and started them in to race the little beetles for pos-session of the barley. He made a fine feed yard, with good fresh water supplied in abundance. We hauled the barley in the sacks, and fed it in shallow troughs which were scattered about in the feed yard. It took some maneuvering to get an open sack close enough to these troughs to avoid some waste, for every one of these grunt-ers was true to type. After the grain was in the trough there was considerable waste, owing to the fact that they were just plain pigs, more fond of standing in the trough than out of it, and equally keen on filling their mouths at one trough, and running to the next one, spilling a good share of the first mouthful on the way. I had seen self-feeders used successfully, but the boss didn't ask advice, and I didn't offer any. We just kept on throwing barley at those hogs till they ate up and tramped into the ground the big granary of barley. Then we drove our army of very fat hogs to town and the boss took them into 'Frisco.

He says there is no money in hogs,—that he lost a thousand dollars on his experiment,—that he could have sold his barley, in spite of the beetles, for more than he got for his hogs by a thousand dollars. He is right about that part of it. He is wrong about there being no money in hogs.

But his mistakes are so typical of hundreds of grain farmers that they are worth pointing out.

(1) The hogs he bought were nearly all over six months old, and should have been on the consumer's table before he bought them.

(2) His way of feeding was wholly wasteful.

It cannot be too strongly emphasized that a hog after six months becomes as truly a "robber hog" as the worst type of our "boarder cows."

The REMCO SILO

Made of Air-Dried Redwood The Standard

Mr. A. L. L. Dairyman,
Everywhere, Calif.

Dear Sir:

What would you give for Green Pasturage the year around? If you had it you'd make a lot more money, wouldn't you?

You can have it or its equivalent, THROUGH SILAGE, at less cost in labor and money than through natural pasturage, almost without re-gard to seasonal conditions and dependent only upon your own efforts.

Corn is not the only crop for silage. Feterita, Milo Maize and Other Sorghums, Barley, Oats, Alfalfa, Vetch and Cowpeas all make good silage.

You do not have to wait until next fall to profit from a silo. Fill it in the spring with fall-sown grain or the first cutting of alfalfa, and insure against such losses as you had this season. Ask us about it.

Being a "Knower," Not a "Guesser."

The Story of Accomplishment on a Pioneer's Grain Farm, and How a Native Son Breeds Holsteins at a Profit.

The thing that most impresses you is that he is a "knower" rather than a "guesser." He comes the nearest to filling the title of "Efficiency Engineer" of any agriculturist we have ever met.

Ten years ago, he assured us, there were 10 sacks of grain left on the ground when they harvested a 30-sack crop of grain. Now a hog gets poor following his machine. "What's the use of growing grain if you don't put it in the sack?" he asked. What indeed is the use? Yet how many have learned that by slowing up the harvester this saving of grain in the sack is so great?

That "stopping of leaks" is, we found, a characteristic habit of Glon Gibson, manager of the J. S. Gibson Company's ranch near Williams, Colusa county.

When he took charge of the ranch, on which his father pioneered, grain, hogs, and horses were the revenue-getters. As with so many big-acred ranches, the land was showing the need of something else than a grain diet. The horses and hogs helped some for they were kept in large numbers, but still there was a fertility leak that required the diversification cure.

Diversification meant water development. That meant wells and wells meant machinery. It all meant money; but after spending a small fortune, largely attributable to dry holes, he eventually got water. Enough to some day irrigate 300 acres, although but 75 have yet been seeded to alfalfa.

In spending this time and money he had a well-defined plan in mind. He would feed the alfalfa to dairy cows, put the manure on the land and the skim milk into hogs. Instead of keeping hogs a year, he would turn them off at six to eight months. Counting each month as a leak he would save four to six leaks on every hog.

Before this time he had started to breed better hogs. Not because he "guessed" they would make more money but because results showed that they did. He finally went so far on this "know" basis as to start a purebred Berkshire herd, not so much to become a breeder of purebred hogs as to become a more economical producer of market hogs.

Probably his experience with hogs had a lot to do with the way he bought dairy cows. At any rate when he started on a commercial scale six years ago, he ran true to form by purchasing a herd of registered cows. He was too good a "knower" even then to expect all of the 30 head to be as good ones. And they weren't. Some had tuberculosis. They were disposed of. Others were shown up by the scales and the Babcock tester to be registered boarders. They met a like fate.

But this didn't all happen at once. It was spread over a couple of years. In the meantime he had purchased another purebred Holstein, a bull that was later to have a finger in international Holstein pie cutting.

Critics may accuse him of being lucky in this particular case. We

thought so at first, but as he related the buying transaction of that bull we admitted that his "knowing" was the responsible factor.

In the first place he didn't look for the cheapest bull he could buy. He went to a prominent breeder with the request that he be shown the best young bull on the place. He was shown one, out of a promising young cow, and bought him for \$500. Five years ago that wasn't an every-day price by any means.

You can call it luck that this bull's dam, Tilly Alcartra, later became a veritable fountain of milk and broke world's records for milk faster than the target setters could adjust their sights. But it wasn't. It was "knowing" the good business doctrine that "you get what you pay for" that had landed him in fashionable company.

Tilly's record-breaking stunts came almost three years after the bull transaction above related. During those years the Gibson Company learned a lot about Holsteins. They also began to diversify their farm crops by growing some to balance the dairy ration. A silo was erected and that called for corn, a good rotation crop with grain. Incidentally they were increasing their average production by testing and weighing the milk. Then they were beginning to get a few calves, sired by their young bull.

About the time these calves began to come, private advices said that Tilly Alcartra was on a "world busting tour"; and before any of them were a year old her record of over 30,000 pounds of milk was officially announced. When Holstein breeders began looking her up in the blue book they found that her best bred son, the only one being used on a purebred herd, was owned by the J. S. Gibson Co. and that his name was Prince Alcartra Korndyke.

We leave it to the reader's mind how Prince, as he is known on the Gibson ranch, pyramided in value, confident that he won't over-guess the price that was refused for the bull.

That was less than two years ago. Since then Prince's mother has completed a two-year world's record for milk that astounded everyone. Since then the official testers of the University of California have spent much time on the Gibson ranch. At first they worked on the cows selected from the original foundation herd. During the last year they have from time to time, found new cows in the herd—cows that Glon Gibson went out and purchased for several times what he paid for his bull. His bull is too valuable to limit to a few cows. He is too good to breed to poor ones. So when Mr. Gibson has seen good cows for sale he has bought them, notwithstanding that Holstein values have been high.

Don't think, though, that his bull has carried him off from his otherwise conservative course. He hasn't been five years at breeding for nothing. Last year when he paid the top price at an auction sale for Winnie Korndyke Cornucopia some

BIG TYPE POLAND CHINAS

Gilts from Weanlings to one year old. Bred or open. Boars from weanlings to 8 months.

THE BROWNING STOCK FARM

W. H. BROWNING, PROP.

WOODLAND, CAL.

One of Gibson's High Record Cows.

Stacking Hay with Donkey Engine.

Son of Prince Alcartra Korndyke.

wondered if she was worth it. In the first 120 days of her yearly test she had averaged 100 pounds of milk a day and put on 300 pounds of flesh. Also she had increased in value some, an offer from another breeder of twice her purchase price being turned down.

Perhaps nothing so well answers the question "Will the Gibsons stick?" as this refusal, time after time, to sell at a high price what they have bought at a lower one. The same has been true of the granddaughters of Tilly Alcartra. Always there is a demand for them, but they are all on the Gibson ranch. Twenty of them will freshen next fall, having been bred to Segis Cream Cup Pontiac, a son of Segis Pontiac De Kol Burke and a grandson of the previous world's record cow Riverside Sadie De Kol Burke. This intensifying of record breaking ability will be continued in order that the family legend "The Name Gibson Insures Quality," may be perpetuated.

At the beginning we said that Gion Gibson was a "knower." This holds true with each department of his farming. Besides Holsteins he grows wheat, barley, oats, corn, milo maize, beets, alfalfa, hogs, and horses. They are all given a place in the big ledger at the office, and while red ink entries are seldom necessary, they locate leaks before much damage is done.

After all it is at the office that you most appreciate the efficient manner in which this farm is managed. As Mr. Gibson settles down in his chair after a hearty evening meal, and that is the only time he seems to have for office work, he throws a lot of enlightenment on features that have been bothering you.

The donkey engine that you saw out at the hay stack is used, you learn, because it stacks hay cheaper and more quickly than a horse. You learn that while he raises horses for the market he uses a tractor to do his plowing and that he spent \$2651 on it last year while it was doing \$2767 worth of work, figuring on a basis of \$15 a day rental.

You also see that the hogs are charged 20 cents a hundred for skim milk from the dairy and that they didn't pay as well last year as in years past. That the house is charged up with milk and cream from the dairy as well as other products grown on the farm.

If you take the time you can see to a cent the expense account of each member of the firm last year, the mother, two sisters, and Mr. Gibson. And then there are the entry spaces for horses and mules, sheep, tractor, hay, grain, ma-

chinery, improvements, hogs, dairy, and house.

After looking and marveling at his book-keeping system you are not so terribly surprised to see an adding machine, the first one you have ever seen on a farm—bought because it saves time in adding milk records, or other long columns of figures. In other words it puts the "know" on paper and eliminates guessing. And anything that does that has a place on the Gibson farm.

COW TESTING ASSOCIATION RECORDS.

[Written for Pacific Rural Press by Prof. F. W. Woll.]

Replying to your inquiry, regular cow-testing association records will be accepted in the State Dairy Cow Competition for prizes; but it is very likely that we shall require that at least two of the monthly tests shall be conducted by one of the regular supervisors employed by the College. This requirement is made when the men in charge of cow testing associations conduct official tests of cows owned by members of their association. This seems desirable and necessary, in justice to all concerned, and to make certain that this work is conducted in a similar manner throughout the State.

We shall require owners of cows entered to furnish copies of the milk records for each month, where such records are kept regularly,—otherwise, our own men, or the men in charge of the cow testing associations will take care of all records required. All the necessary blanks are supplied by our College. Entry blanks will be sent out from Oct. 1, and later.

SHARKS IN FARM LOAN WATERS.

Secretary Flannagan of the Federal Farm Loan Board at Washington has issued a warning to farmers that solicitors are busy in several states without authority of the board, attempting to collect money for the organization of national farm loan associations.

Such associations are authorized under the laws and are to be formed by farmers who desire loans.

"The representation by any person that any organization is now offering to make loans by authority of the farm loan board under the Federal farm loan act is false," said Flannagan.

Flannagan said information had been received from Montana, Idaho, and other Western States to the effect that unauthorized persons were soliciting subscriptions there. He said farmers personally known to each other should plan the organization of loan associations.

PREFERS SOILING TO PASTURING.

A dairy cow should never be pastured, not only because of danger from bloat but also because of the damage pasturing does to alfalfa, believes A. J. Hesse of Merced county.

But green feed is necessary for the maximum returns; and this is

accomplished by feeding green alfalfa and corn during the summer season, two feeds of alfalfa and one of corn being the rule. Not only does this prevent packing of the soil which retards the growth of alfalfa, but it results in a direct saving of hay, as there is practically no waste of the green alfalfa or corn fed in this manner.

SANTA ANITA RANCHO

ANOAKIA BREEDING FARM

First Annual Sale, October 23rd and 24th

THOROUGHBREDS: A few mares and some two and three-year-olds, sired by the famous Derby Winner, **Rey El Santa Anita**, and the noted stallions, **Palo Alto** and **Jake Argent**, out of famous thoroughbred mares.

ARABIAN THOROUGHBREDS: Two-year-olds, sired by Imported Stallion **Ibn Mahrudd**, head of our Arabian Stud. Dams are the choicest thoroughbred mares of Santa Anita Rancho.

SADDLE HORSES: Fourteen of them, some of which are sired by **Ibn Mahrudd**, world renowned imported desert saddle stallion, and **Don Costano**, a five-gaited Kentucky saddle stallion. These horses are mostly three-year-olds.

POLAND CHINA AND BERKSHIRE BOARS: Four to nine months old. Sired by famous Poland China herd boars—**Banker's Boy** and **Glenview Wonder**. And Berkshire Boars—**Kintyre Laird**, **Grandson's Duke** and **Fashion's Longfellow 5th**.

The dams are from the very best blood lines. Most all these animals have winnings at World's Fair. Write for catalogue.

HOLSTEINS: We will sell a number of young bulls. Some sons and grandsons of the noted **Prince Gelsche Walker**, and bulls from one World-Record cow and two California State-Record cows. Sixty females of the highest class will be consigned. Write for catalogue.

WORK HORSES AND MULES will also be offered for sale.

WRITE FOR PARTICULARS.

Anita M. Baldwin,

W. H. TAYLOR, Superintendent.
Santa Anita, Cal.

GRANDSONS OF TILLY ALCARTRA

Prince Alcartra Korndyke,
Best bred son of Tilly Alcartra.

Our supply of these young sires is always limited, but we have a few now which we are offering at very reasonable prices.

Write us at once, or call and see the herd.

J. S. GIBSON CO., Box 97, Williams, Cal.

"THE NAME GIBSON INSURES QUALITY."

At prices within reach of every Breeder and Dairyman.

When you buy a son of our herd sire, **Prince Alcartra Korndyke**, you get more than a Holstein bull with registration papers—you get a grandson of the world's greatest milk cow out of a high-testing A. R. O. dam. Our herd of females has been developed into one of the best in the State.

FOR SALE

Two Imported Registered Shire Mares

Nine years old; well broke to work, absolutely sound, regular breeders. Have foals this year. Now in foal by **COLUMBIA MODEL**, winner P. P. I. E. Span weighs over 4000 lbs. Price reasonable. Selling account overstocked. For prices and further particulars, address

BRIDGFORD COMPANY,
Knightsen, Contra Costa County, California.

With the Livestock Men.

[Livestock breeders all over the State are invited to send on postal cards, notes regarding their sales, State and County Fair intentions, new stock, etc.]

DAIRYING AND DAIRYMEN.

A casein plant is to be established in Modesto which will use the skim milk from 3,000 cows. Casein is used as a substitute for albumen in the dyeing of calicos and in the manufacture of paper and buttons.

Seven carloads of thoroughbred Holsteins from some of the noted herds in Wisconsin have been bought by Sacramento dairymen. Fred Kiesel and J. M. Henderson, Jr., of Sacramento are among the heavy purchasers.

T. S. Griffith who furnishes purebred Jersey milk to Spokane held a banquet in his cement cow barn, to which a number of his friends and a deputation from Spokane were invited. The Jersey cows present behaved decorously.

A Tulare dairyman keeps his can of cream cool until the hauler gets it by having iron rings inside a sack big enough to hang over and around the can. A drip of water is turned onto the upper end of the sack. The hauler turns the water off.

The Harmony Valley Association are erecting a cheese storeroom with a capacity of 50,000 pounds of cheese at their plant in San Luis Obispo county. This concern annually makes about 200,000 pounds of cheese and a little over 300,000 pounds of butter.

"Heavier feeding and extra care of cows will pay in more than half the dairy herds of Ohio," says C. C. Hayden of the Ohio Experiment Station. His deduction is based on the fact that little extra time in feeding and caring for the animals is needed and no more stable room nor equipment required.

The Iowa owned Jersey, Sans Alois Tormontress, made 10,514 pounds milk from which was made 662.3 pounds butter in a year, commencing at the age of 3 years 19 days. Her daily production during the first month was 1.76 pounds fat and during the last month of the year's test, she averaged 1.777 pounds fat. She dropped a calf three months after finishing.

HORSES, SHEEP, HOGS, ETC.

Twelve carloads of mules are being shipped from Yolo county and vicinity to Oklahoma City.

J. W. McCord has sold two fine Shire stallions to the firm of Ruby & Bowers. They are shown at the State Fair.

Frank Bullard of Woodland has shipped 57 head of Rambouillet rams and ewes to the Livestock Show at Salt Lake City.

Two carloads of fine cavalry horses bought in the vicinity of Marysville recently were sent "by express" to Chicago, whence they will be shipped to France.

On the first of this month the price of hogs in the East jumped up to the highest level reached since 1865. Choice hogs were quoted at \$11.40 a hundred pounds.

A. H. Tilton of San Bernardino is moving his Percheron stock to Prescott, Ariz., where he also has some 60 purebred Herefords. Five registered mares will be sold, but the stallion, Loussett, imported from France by McLaughlins, will be sent to Ariz.

Chas. Kimble, the well-known Rambouillet breeder of Hanford, Kings county, reports feed conditions in the lower end of the San Joaquin valley very good for sheep with prospects that it will continue to be good through the fall. Shearing is in progress on his flock at this time.

From a western ewe, a fairly good purebred mutton ram at the Mo. Expt. Sta. got a lamb which weighed 60 pounds at three months and sold for \$7.35; while a scrub ram crossed

on a similar ewe got a lamb that weighed 56 pounds at four months and sold for \$4.50.

MISCELLANEOUS.

The Kings County Poultry Association is to be reorganized with a view to more active work.

All abattoirs in New Zealand are municipally owned. This form of ownership of slaughter-houses has worked satisfactorily in every way.

Six carloads of feeder cattle to eat beet tops were shipped one day by one company to the Compton, Los Angeles county, fields recently.

The Second Annual Horse Show and Water Carnival at Rio Vista will be held Saturday, Sept. 23. An attractive premium list is offered.

The Hayward Pigeon Club will hold in November the first pigeon show ever held in that district. Entries of both fancy and utility pigeons will be invited.

O. L. Linn of Modesto has been stocking up with Iowa Poland China sows, one of them being Big Knox Girl having taken the first prize as a gilt in the Iowa State Fair last fall.

Feeding beet pulp to beef cattle has commenced at the Salinas plant of the Spreckels Sugar Co. Beet tops are also being pastured off by cattle men in all of the larger beet growing districts.

The Uruguayan Meat Freezing Plant in the district of Cerro has closed, throwing about 2000 people out of employment. Lack of ships available for neutral commerce is given as the cause.

The Solano County Fair made awards to J. R. Bloom as follows: One-year-old ram, first; one-year-old ram, second; buck lambs, first, second and third; ewe lambs, first and second; pen of four ewes and one ram, first prize.

In the combination sale of McAllister & Sons and Col. Ben. A. Rhoades at Rivera Sept. 19-20, there will be consigned seventy head of their best stock. Among the A. R. O. cows is Venango Queen, who has a record of 27.27 lbs. butter in seven days. Good 2-year-olds to be offered are Cleopatra Constantyn, who made 22.21 lbs. butter in seven days, and Betsy Lamb Prilly, who made 20.13 lbs. butter in seven days at 2 years and 8 months.

R. K. Walker of Peters, Lamson & Walker reports the purchase of some of the best breeding Duroc Jerseys ever brought into the State. They consist of two boars and a gilt, all line bred Golden Models from the herd of Mr. Waltmeyer, Melbourne, Iowa, the originator of the Golden Model family. One of these boars was the best pig Mr. Waltmeyer had raised this year. He also selected four Defender-Golden Model bred gilts, a combination of breeding that is becoming very popular in the East. These animals may be seen in the Peters, Lamson & Walker herd at the Riverside fair, Oct. 10-14, or at the Devore Ranch ten miles northwest of San Bernardino, on the main lines of the Santa Fe and Salt Lake railroads and on a concrete road from Los Angeles. Mr. Walker did not buy these animals by mail, but spent a month among the best breeders of the East selecting them.

LIVESTOCK FAIR NOTES.

Winter silage is one of the principal questions in Nevada. At present there are but three silos in the State. Corn is almost out of the question, but there is some talk of trying wheat for silage.

The Napa County Farm Bureau Fair will be held at Napa, Sept. 14-16. Livestock entries for the fair are being received rapidly. A. L. Tubbs, a member of the Yorkshire

LIVESTOCK DIRECTORY.

Rates in this directory, 3c per word each issue; or if carried weekly for one year, 2 1/4 c per word.

SWINE.

Poland Chinas.

BIG TYPE POLAND CHINA HOGS—Bred sows, bred gilts, open gilts, weanlings, both sexes, boars ready for service. Herd sires, Iowa Wonder and Joker. Iowa Wonder is a son of "A Wonder," the greatest Poland-China boar living or dead. Joker was the First Prize boar in the Under Six Months Class at the Wisconsin State Fair in 1915. All animals are registered free of charge. Prices low on account of being overstocked. All animals first class. Quick, easy feeders, the kind the farmer wants. As a special premium each purchaser will be given a year's subscription to the "American Swineherd," the special advocate of the Poland-China, and a copy of "The Handbook on the Sow" and "The Pig Feeders' Manual." Write Geo. A. Smith, Corcoran, Cal.

FOR SALE—One tried Poland-China brood sow; bred for second litter to an Orange Wonder Boar—\$35. One Nov., 1915, gilt, bred to Matchless Perfection 2nd, "an extra good boar from Davis College"—\$30. Four extra good, thick, long and deep February gilts—\$20 each, out of a 500-lb. sow and sired by a W. A. Young boar—\$20 each or the four for \$70. All recorded. Crated and transferred to C. B. Safe arrival and satisfaction guaranteed. N. M. Lester, Gridley, Cal.

YOUNG POLAND CHINAS, LARGE TYPE—Boar IBA Wonder won first and Reserve Championship P. P. I. E., weighing 730 pounds under 2 years and in breeding condition. 60-day special—fine young sows bred to IBA Wonder at very low prices; also weanling pigs, either sex. Satisfaction, or money refunded. W. A. Young, Lodi, Cal.

POLAND-CHINAS—Bred gilts, \$15; young boars, \$10 and \$15; bred sows, \$25. Weanlings, either sex, \$6. Registered and crated, purchaser to return crates. E. A. Hall, Watsonville, Cal.

LAKESIDE STOCK FARM POLAND CHINAS are money-makers. Satisfaction or money refunded. Geo. V. Beckman & Sons, Lodi, Cal.

BIG-TYPE POLAND CHINAS—Stock from the best herds of the Middle West. N. Hauck, Alton, Humboldt Co., Cal.

POLAND CHINAS—Big type. Shoats, either sex, or in unrelated pairs. O. L. Linn, Linview, Route 4, Modesto, Cal.

REGISTERED POLAND CHINA SWINE—Prize-winners. Finest stock in the State. \$20 up. M. Bassett, Hanford, Cal.

POLAND CHINA HOGS FOR SALE—Registration papers furnished free. C. A. Cooley, Durham, Cal.

REGISTERED POLAND-CHINAS and Duroc Jerseys. Cholera immune for life. T. H. Beckman, Lodi, Cal.

POLAND-CHINAS—Large type. The Browning Stock Farm. W. H. Browning, Woodland, Cal.

POLAND CHINA HOGS—Registered. Cholera immune. E. J. Miller, Llewellyn Ranch, Lathrop.

SIX REGISTERED, large-type Poland-China boars, six months old. \$10 each, if taken immediately. Route 1, Box 34, Galt, Cal.

REGISTERED POLAND-CHINA HOGS—J. A. Clark, R. 4, Lodi, Cal.

POLAND-CHINA HOGS—C. A. Stowe, Stockton, Cal.

KNOX HILL STOCK FARM—Registered Poland-China Swine. A. M. Henry, Farmington.

REGISTERED POLAND CHINAS—Young stock for sale. J. H. Cook, Paradise, Cal.

REAOAKS RANCH herd of registered Poland Chinas. W. J. Hanna, Gilroy.

REGISTERED POLAND-CHINAS and Duroc Jerseys. M. F. Harrold, Orland.

POLAND-CHINAS—Prize-winners. Money-makers. W. Bernstein, Hanford, Cal.

Berkshires.

REGISTERED BERKSHIRES—World's Fair Grand Champion at the head of the herd. Also winners of Senior, Junior and Reserve Grand Champions. Stock of all ages for sale. Grapeville Farms, A. B. Humphrey, Prop., Escalon, San Joaquin Co., Cal.

BERKSHIRES—Herd headed by Artful Masterpiece and Improver B. Grand Champion at California State Fair, 1912 and 1913 respectively. Open sows, service boars and weanlings for sale. Oak Grove Dairy Farm, Box 1, Woodland.

BERKSHIRES—I have one of the best herds on the Pacific Coast, including Grand Champion Sow, Reserve Grand Champion Boar under one year, Third Aged Boar, etc. Frank A. Brush, Santa Rosa, Cal.

SPECIAL SEPTEMBER OFFERING—Berkshire boars 3 to 11 months. Also aged boar. Write for photo and prices. Imperial Stock Farm, Morgan Hill.

STATE FAIR LIVESTOCK NOTES.

Note.—These are far from complete as the judging was still in progress. Full awards will be given next week.

C. E. Barrows of Santa Rosa lost his aged boar Panama Lee at the State Fair.

There were about 800 hogs at the Fair, about 300 of which were Berkshires.

First prizes in Berkshires at the State Fair went to: H. L. and E. H. Murphy for Rival's Robin 2nd; H. L. & E. H. Murphy, Majestic's King 6th; F. R. Steel, Winona Lee Champion 2d; A. B. Humphrey, Fashion Longfellow 30th; D. C. Beeman, Glen's Duke 20th; A. M. Smith, Winona Royal Champion 5th; A. B. Humphrey, Grand Lady Mayhews 4th; A. B. Humphrey, Grand Bernice, and others judged too late for us to get this issue.

First prizes in Poland Chinas at the State Fair went to: Model Major, owned by H. I. Marsh; Chief Victor, M. Bassett; Gold Boy, M. Bassett; Husky, J. W. Howard; C's Charmer, G. V. Beckman; Miss Beauty, M. Bassett; California Sunlight, University Farm; Gold Drop, M. Bassett; Black Beauty 2d, M. Bassett; Good Style, M. Bassett.

For the Poland China boar and three sows over a year M. Bassett won first, W. A. Young second, A. M. Henry third. For the same under a year, M. Bassett won first, F. D. Ross second, and Geo. V. Beckman third. The same winners in the same order as above took the prizes on boar and three sows under a year bred by exhibitor. For four swine get of same boar and bred by exhibitor, M. Bassett took first, Geo. V. Beckman second.

M. Bassett's Chief Victor was grand champion Poland China boar. The same exhibitor showed the grand champion sow, a yearling.

A. W. Morris & Sons' bull Segis Pontiac De Kol Burke won grand championship. He is a son of the former world record Riverside Sadie De Kol Burke. One of his daughters, Contenta Pontiac Burke, was easily first in her class.

Guernsey winnings were pretty well spread out among the breeders, some of Dupee's Panama-Pacific winners coming back for blue ribbons.

A Hereford cross bred fat calf won over a heavy two-year-old because, as the judge said, it is not weight that is wanted so much as the proportion of weight of the high-priced meat. The winning calf had a smaller proportion of shoulder and a greater proportion of loin.

Two beef bulls were judged. One was fat and much bigger than the other, but his flesh was in patches. The smaller one, belonging to Jack London, won largely because of his smoothness, which indicated to the judge his capability of producing smooth-fattening calves.

T. S. Glide's sheep pens were well decorated with blue ribbons at the State Fair. He had both Shropshires and Rambouillets in the purebred classes.

W. M. Carruthers won the grand championship for his Shorthorn bull Count Glory.

The draft horse show consisted mainly of Panama-Pacific prize winners, though there was also some stock never shown in California before.

Judge Majors of the Holsteins made a hit with the crowds by telling the points from head to tail, on which he based his decisions. Professors Thompson and True also did this to a lesser extent on Guernseys and Berkshires.

Of two hogs that looked alike, one lost because, while it was

deeper, it was not quite so uniform in width, not quite so classy in finish, but largely because its feet were not so strong.

The San Luis Obispo State Polytechnic School would have exhibited two two-year Percherons and a Clydesdale if funds had been available.

STATE FAIR NOTES.

There were 76 automobiles of 31 makes in the big auto tent.

Attendance records were muddled by the burning of the administration building and had not been straightened out on the day of this writing. It was officially estimated that 5000 besides the children attended Saturday, 10,000 Sunday, and 40,000 Monday.

The county and industrial exhibits and all the offices of the State Fair officials were in the Agricultural Building which burned to the ground Sunday night at a loss estimated at \$75,000 for the building and \$100,000 for the exhibits.

Counties which lost their exhibits in the fire immediately forwarded some more which were housed in Sacramento city election booths loaned to the State Fair for the purpose.

Before the Fair closed, Machinery Hall was filled with exhibits besides those in the open annex. Pumps made a stirring sight by shooting water at cross angles to each other over the tank which they surrounded.

SAN LUIS OBISPO DAIRYMEN ORGANIZE.

At a large and enthusiastic meeting of the Dairymen of San Luis Obispo county, it was unanimously agreed to organize a Dairymen's Association, to promote the breeding and improvement of high grade and purebred dairy cattle in San Luis Obispo county and to aid its members in buying, breeding, and selling first class animals; also the establishment of a good reputation for San Luis Obispo county as a dairy center. When the association is completed, its members will list nearly five thousand cows. The following officers were elected: President, Mr. A. B. Spooner, Jr.; vice-president, Mr. E. R. Lewis; secretary, E. L. Westover of the Cal. Polytechnic School; treasurer, S. J. Lowe. These officers were given power to appoint a director from each of seven or eight districts.

NATIONAL WOOL GROWERS' RAM SALE.

The first annual ram sale held under the auspices of the National Wool Growers' Association at Salt Lake City August 30, to Sept. 1, was decidedly the biggest event of its kind ever staged in America according to Chas. Kimble and other prominent California sheep men who were in attendance from California.

Because of the interest in the show and sale the proposed meeting was postponed till January 1, and in the future meetings and sales will be held independently of each other.

Lincoln-Cotswold breeding rams sold from \$100 to \$500. There was no competition in the Shropshire, Romney and crossbred division but all were represented.

What is said to be double the price ever before paid for a Hampshire ram in this country was \$615 by Walnut Hall Farms of Kentucky. The first prize pen of Hampshire rams sold for an average of \$205 to Brown Bros. of Idaho, and the second prize pen, of Butterfield Livestock Company's breeding, sold for an average of \$130 to Wood Livestock Co., Spencer, Idaho.

Of the 3,000 head sold all were rams but 150 head of ewes, and prices were the most startling on record, the highest price being secured by the Butterfield Livestock Co. of Idaho, for a Rambouillet ram. J. H. Seeley of Mt. Pleasant, Idaho, paid \$1,000 for this ram. A. A. Wood & Son of Michigan were buyers of the second highest priced Rambouillet ram at \$800. The first prize pen of 25 ram lambs of this breed sold for an average of \$65 a

head, the second prize pen for an average of \$90 a head, while the third prize pen consigned by the Bulard Co. of California, sold for an average of \$65.

COVERED FEED RACKS.

[Written for Pacific Rural Press.]

In no place do dairymen enjoy a milder winter climate than in California; yet it is being recognized by progressive farmers that the practice of compelling the dairy herd to stand out in cold rains and muddy corrals materially reduces the butterfat income.

One of the most inexpensive methods of overcoming this loss is the feed shed and shelter system used at the Napa State Hospital near Napa.

Two 100-foot feeding sheds 28 feet wide are provided for this herd, the gabled roofs being shingled. These roofs are supported by heavy uprights along the sides and in the feed alley that runs the entire length of the building. This feed alley is wide enough to accommodate a small feed truck; but V. L. Heath, foreman of the dairy, believes they would be more convenient if built wide enough to accommodate an ordinary hay wagon. This would necessitate a wider building.

The hay racks have mangers underneath to catch all loose hay that may drop through the slats. A brick-covered floor is provided in front of these mangers, this floor being wide enough so that the roof protects the cattle from heat or rain while they are eating.

The sides are open; the cattle come and go at will; this is true also of the shelters, built exactly like the feed sheds but omitting the feed racks.

With well-drained corrals and brick or concrete floors, which can be easily cleaned, this system dispenses with the usual winter mud, almost entirely.

MODEL HERD OF BERKSHIRES

Bred for size, bone and quality. Pigs for sale, sired by Big Royalist 180837 and Breed's Model 165859, both winners of blue ribbons at State Fair. Descriptive catalog upon request. J. L. GISH, Laws, Inyo County, Calif.

Tamworths and Duroc-Jerseys

We can fill orders for mature stock and weanling pigs of both sexes. This is the largest herd of TAMWORTHS in the State. Our Stock is sure to please.

OPENING DAY STATE FAIR.

(Continued from first page.)

Livestock was magnificently represented. Numerous and commodious as were the stalls, there were scarce too many in any class. The time will probably come soon when all the exhibit livestock may be together at one end of the grounds. It seems too bad to have horses and dairy cattle at one end, while other cattle, sheep, hogs, and horse-show tent are at the other. Very few cattle other than Holsteins could be accommodated around the general dairy exhibits, and the rest of the dairy cattle were at the north end.

Such a display as it was! The winners in most of the classes and divisions may well boast of their winnings. Aged bulls, and young calves seemed especially numerous and fine.

Hogs were surprisingly numerous, and of fine quality. Almost every one of the new pens was occupied, many with more hogs in each than one might have expected. Weight, quality, fecundity and ability to transmit quality to offspring, were all well illustrated by the leading breeders of this State and Oregon.

Horses filled practically all the stalls available. This class was especially strong in Panama-Pacific prize winners. Drafters, racers, saddle horses, and ponies were considerably mixed, so one would have to look at all the stalls to be sure he had seen all of his favorite breed. Extra care had been taken in decorating some of the stables. Fifteen

or twenty ponies were located in a rather inconspicuous shed.

Beef Cattle made a small but quality class, mostly Shorthorns. From the proportion of whitefaces which come to our stockyards, it would seem they would be stronger at the Fair. We remember some very nice Herefords at the 1908 State Fair, though we were informed that these had been bred in the East and brought to California to improve range stock. The University had an educational variety of breeds.

Sheep.—There were quite a few sheep, Shropshires predominating, but with a good show of Hampshires and Merinos—more than our list of entries indicated. These being blanketed, were less subject to observation and criticism prior to the awards, but there were exhibits from the northern States and many former prize winners.

Identification of Exhibits.—The University and a few other breeders did something which, if more generally practiced, would double the value of livestock exhibits to visitors and greatly increase their advertising value to exhibitors. The University placed simple cards over each pen, telling the breed, name, date of birth, and present weight of stock. In case of beef, they also gave the cost per pound of gain. One breeder showed on similar cards the breed, class, and name of stock, and name and location of the farm and owner. Other breeders designated their Panama-Pacific prize winners.

Amusements.—Joe Boquel did some of his most spectacular flying. Horse races amused the crowd while he was soaring to become a mere butterfly, seeming to rest on the fleecy clouds, but no horse race could draw attention while he was whirling his slim corkscrews straight down, or rolling over and over in the air. His loops seemed tame in comparison. Of the aggregation of cheap entertainments behind the grandstand, little can be said except that they were predominantly immoral gambling devices, insidiously encouraging children's and degenerates' ideals of getting something for nothing.

EYE HOG PASTURE.

[Written for Pacific Rural Press.]

California farmers don't fully appreciate the value of rye as a field crop for livestock, according to George Farmer of Kings county, who has been raising it in small fields for several years with good results. As an illustration of the carrying capacity of rye as a hog feed, Mr. Farmer tells of his experience the past spring with five acres of early winter seeded rye. In December the rye was high enough to warrant turning 78 weanling pigs into the field, where they were pastured continuously till May 1, at which time they weighed an average of 101½ pounds. After taking the hogs off the rye, it was allowed to go to seed; and when finally harvested, it went eight sacks to the acre. Later the ground was irrigated and plowed and put into a summer growing crop.

The chief advantage of rye is its hardiness as a pasture crop. Mr. Farmer believes, but if cut in the boot, he has found it makes a very good quality of hay.

Good Enough for Any Herd

AAGGIE GRACE PONTIAC
CREAMELLE,

Half Brother of Marie Clothilde
Pontiac Creamelle, California
Champion 2-year-old.

This youngster's dam, Aggie Grace Brookside Princess, grand-daughter of Pontiac Korndyke, the greatest Holstein sire in the world, has an official record of

28.17 lbs. BUTTER - 456 lbs. MILK
TEST 4.0%

This record was an increase of 6 lbs. butter over her previous record and I expect her to make at least 30 lbs. on her next test.

His sire is Dutchland Pietertje Creamelle, one of whose daughters at 2 yrs. 1 month has just made a record of 22.62 lbs. butter, 391.7 lbs. milk, test 4.72%, making her California's champion 2-year-old.

This young bull is perfect in type, is 50% white and just ready for service. Born Apr. 22, 1915.

My showing at the State Fair will include the Champion 2-year-old, her dam, her full sister, and a few choice young bulls for sale.

BREEDER OF HIGH-TEST
HOLSTEINS.

F. STENZEL

SAN LORENZO, CALIFORNIA

Labor Cost

on dairy and stock farms is one of the largest expense items. Light and sanitary barns are as necessary as proper feeding to get the best from your herd. You can paint the inside of your buildings as white as snow and with the same operation, at no extra cost for labor, thoroughly disinfect them against the diseases that affect your livestock and poultry by using

CARBOLA
The Disinfecting White Paint

A mineral paint combined with a germicide 20 times stronger than carbolic acid, but harmless to man, beast or fowl. Kills lice, mites, fly-eggs, etc. Comes in powder form. Ready when mixed with water to put on with brush or sprayer. Will not spoil by standing. Get some today from your dealer and have it handy for the first chance you get to try it.

Use It Instead of Whitewash

to paint health and sunshine into barn, dairy, poultry house, cellar, creamery and out-building. No offensive odor. Will not taint milk or other food products.

10 lbs. (10 gals.) \$1 and postage. 20 lbs. (20 gals.) \$2 delivered.

50 lbs. (50 gals.) \$4 delivered.

Trial package (covers 250 sq. ft.) and booklet "The Disinfectant That Prints" for 25 cents and dealer's name.

and O. I. C. Swine

With our herd will be a number of young Jersey bulls, ready for service, and out of our large high-producing cows, that will be for sale.

Also, young boars of splendid growth and type.

If you need a herd sire, be sure to see this lot at your nearest fair. We are taking them there for your inspection before buying.

If more convenient, visit our ranch or write for prices and pedigrees.

Raising Poultry for Profit

WINTER EGG PRODUCTION.

[Written for Pacific Rural Press by Susan Swagsgood, Pomona.]

When a person starts out to tell others about feeding he finds himself deluged with questions that really have no bearing on the subject. Some of them can only be answered by the owner of the flock who knows the conditions.

A book can be written on the subject of "how much grain shall I feed to fifty hens." The only answer anyone can give to that question is to tell them to watch the needs of the fowl and feed accordingly. To get eggs at any time the hens must have a surplus of food over bodily needs. In winter we must allow a third more for cold weather as the hen needs more fuel. Then the feed must be of a more heating character; we must serve more fat producing feed to preserve the temperature, or the feed that should go to egg production will be called on for the needs of the system. If a six or seven pound hen is fed exactly the same quantity as three or four pound hen gets, provided the small hen is confined to close quarters, the small hen will have enough for her bodily needs and the large hen will have to draw on her system for enough energy to run the machine on, so of course there will be nothing left for egg production.

This is why I say all breeds should be fed and cared for separately and the feeder should watch and find out just how much his flock needs for the upkeep of their bodies; then he will be able to tell to a very close margin what is needed for eggs, always allowing for weather conditions.

Another important thing to remember in feeding for winter eggs is that some form of animal meat must be fed or no eggs will come. No matter how bright the combs look, how they talk as they go around; they are really wanting to lay, but the lack of animal food prevents them from attending to that important duty. Milk, beef scraps, blood meal, meat meal, and cracklings, besides fish meal, are all different forms of animal matter. Some are higher in protein than others and some are more digestible than others, and of course the hens will do best on those that are easiest to digest. Sprouted grain is a good egg bringer, winter or summer; so is green bone; almost any good commercial mash furnishes the proper amount of animal food, so that the man with a small flock can have a properly balanced ration without taking any risks. The commercial feed man mixes his feeds according to the season. If you see to it that you get freshly mixed feed and are not buying some that a dealer had in store a long time, your mash feed will be suited to the needs of your hens. During cold wet weather keep your hens in until the ground is warmed up a little; see that they are filled up at night, because it is a long time till morning.

Never feed your hens things they don't like, making it a case of "Hobson's choice." You can starve hens

into eating what you want them to eat; but they can freeze you out on the egg basket first. Hens are like humans, they need food that is appetizing as well as nourishing, in order to do the best possible.

Winter eggs are scarce; if they did not require extra care and feed to get, they would not be either scarce or high in price; and this is why we must give in order to take. The hens must have that which will build them up and keep them in health and vigor or there is no surplus for eggs.

SOLANO CO. POULTRY SHOW FAIR OPENED AUGUST 16.

Points on Utility Birds.—The poultry show held at Dixon in connection with the Solano County Fair was of unusual interest because of a special score card used in judging utility birds. There are several utility flocks in this county, and those in charge wanted to give all poultry breeders an even chance at the prizes whether they were in the fancy business or not. C. R. Fontana of Dixon solicited entries from the northern end of the county, while Harry Mortensen of Suisun gathered in the birds of the central and southern half. Professor J. E. Dougherty of the University of California Farm judged both the fancy and utility birds, using the following score card for utility stock:

Vitality, or vigor and temperament	25
Type, shape, body build, bone texture	30
Shape of head and neck, fineness of comb, etc.	15
Shape, strength and color of legs	10
Development of plumage, etc.	10
Condition (dirty, etc.)	10
	100

H. & F. Mortensen, the White Leghorn specialists of Suisun, won the sweepstake cup. Mrs. R. A. Holdridge of Dixon won the Fontana Cup for the best Rhode Island Red cock; the same bird also won sweepstake on cock. A. L. Harris of the Allendale Hatchery won first on Leghorn females.

FALL HATCHING.

[Written for Pacific Rural Press by Susan Swagsgood, Pomona.]

Last fall the question of fall hatching was pretty full discussed in these pages; there was considerable said for it and a little against it, from a profitable standpoint.

But the Press family is increasing all the time; and we are gaining a little new knowledge, all the time, or seeing things from a new angle, which is about the same thing, so it is but fair to discuss this subject again even if it was well threshed out once.

For those who intend to hatch, it is far better to keep the hens in good shape. The males should have been removed early in the summer so that both sexes were getting a rest, the hens should have been fed but lightly, that is, not fed for any extra laying, but just what an ordinary hen would lay. If these precautions were taken, both males and hens should now be in fairly good condition for the breeding yard.

They should now be mated up, allowing not more than ten hens to a male. We must remember that

this is not the natural breeding season for poultry, hence, there will not be the full vigor we expect from males in the spring. Every hen should be examined for defects that are at all prominent and all should be healthy, with quick, alert eyes, deep chested, with good width for the internal organs. Depth and width give capacity for food. Without that a hen does not count much as an egg layer.

POULTRY NOTES.

The Kings County Poultry Ass'n met August 26 to make final arrangements for the County Fair Poultry show.

Eggs held in storage Aug. 1 by 167 firms who reported to the U. S. Department of Agriculture amounted to 4,797,185 cases containing 30 dozen each. Last year on the same date, 153 firms reported their holdings of eggs at 5,028,812 cases as compared with 4,051,073 this year.

A poultry show will be held in connection with the "Stanislaus Live Stock Show and Exposition" at Modesto Sept. 18-23. The entry fee is 25c for singles and \$1.00 for pens. The premiums are: Pens—\$4.00 1st; \$2.00 second; \$1.00 3rd. Singles—\$1.50 1st; \$1.00 2nd; \$0.50 3rd. All entries must be made by Sept. 9 and as much earlier as possible. If you have not time to get an entry blank make your entry on a plain sheet, to Floyd Wisecarver, Modesto, Fair Secretary. Poultry department in charge of James D. Yates, Modesto.

The International Baby Chick Ass'n was organized at Cleveland, Ohio, August 7-12 to foster and protect the baby chick industry and allied branches of poultry husbandry. This association proposes to work for better eggs for hatching, better hatched chicks, improved methods of shipping, as well as the proper instruction of buyers in the handling and feeding of chicks. The initiation fee including the first year dues is \$10.00, with subsequent annual dues of \$5.00. H. D. White, Saugatuck, Michigan, is secretary.

When to Hatch Fall Chicks.

[Written for Pacific Rural Press by Susan Swaysgood, Pomona.]

The months of September and October are the best two months for fall hatching. Eggs are not quite so high in September as they will be later, and the hens will naturally be stronger. The cockerels from these hatches will be ready for sale in January, and will command a good price. Broiler prices are perhaps higher during late January and February than at any time of the year. The pullets will commence laying in spring almost as early as those hatched in July. The reason for this is that spring is the natural time for chickens to lay.

Failing to be ready to hatch during these months, I would prefer waiting until the hens are through the molt and hatch in December and January. The early hatched chicks get the benefit of the fall days that are full of sunshine; in fact they get a fine start before winter begins and can be raised mostly outdoors; while the later hatched ones must be raised indoors the greater part of the time. This does not make for hardiness in the chicks, nor for saving in the feed bills; but a great many chicks are hatched in November and December and the chicks raised indoors until March. These questions are best settled by the person who is going to handle the chicks, and must depend on how he is situated to care for them.

Little chicks, to thrive, must not be subjected to extremes of cold and heat; they require something like an even temperature. If kept active they can stand quite cool days, but must not be chilled nights nor yet kept too warm.

The hatching of fall chicks is quite as easy as spring hatching; but not quite so easy is it to raise them.

If a person is prepared to give a little extra care, and this care means mostly to watch, so that when it is necessary the chicks can be run into the warm brooder if a chilly wind comes up, or let out to enjoy the sunshine and returned when there is no sun—this is what counts in the successful raising of fall chicks at a moderate cost. There must be green feed and all other things that the spring hatched chick needs.

Last winter at the Grange Stock and Poultry Farms, we had two hatches of Leghorn chicks in December. The hatches were very good for winter months, averaging about 75 per cent; and out of those two lots the death rate was not quite 1 per cent for a month. The chicks were kept in a house warmed with hot air, and brooded in individual brooders of the Victor Incubator Co. The chicks were not allowed out at all as the weather was too inclement until late January or February. The houses were well aired and roomy. There was no crowding and I gave the chicks all the care they needed.

Crowded Chicks Died.—Later, when we commenced to crowd and had more to attend to, the death rate went up, as it always does in large numbers, though we kept each hatch under a separate hover. At one time we had nearly 2000 chicks in a house that was really intended to accommodate 1000. This is the rock nearly all poultrymen split on, trying to raise two chicks where there is but room for one.

There is but one piece of advice worth giving on this question and that is if you are thinking of doing this, simply "don't." Crowded chickens are like plants—they often grow when one would not expect them to; but after they have grown they have no vigor or hardiness to fulfil the duty expected of them.

Market Director Weinstock is making a strong appeal to poultrymen for a State organization to control their products. The Stanislaus County Board of Trade has endorsed the proposition and Mr. Weinstock will address a meeting of poultrymen in Modesto Aug. 26, 2 p. m.

Poultry Breeders' Directory.

BABY CHICKS NOW READY.—Hatches every week. Write for special "Fall Chick" circular. See why Fall chicks pay. R. I. Red, Barred Rocks, Black Minorcas, White and Brown Leghorns. Campbell Poultry Ranch, Campbell, Cal.

CLOSING OUT—FOR SALE CHEAP.—3 Electric Incubators, 576 egg capacity each 16 Electric Brooders, 150 chick capacity each Complete with circuit breakers, thermostats connecting sockets, etc. Address T. R. Jacobs, P. O. Box 395, San Mateo, Cal.

CROLEY'S DRY MIXED INFANT CHICK FEEDS for twenty-five years have been California's standard feed for baby chicks. Insist upon getting same from your dealer. Manufactured by GEO. H. CROLEY CO., Inc., Poultry Supplies, San Francisco.

BUFF ORPINGTON CHICKS.—September and October delivery. First hatch Sept. 13th. Orders taken from 25 to 150; \$15 per 100. Eggs \$1.50 per 15; \$8 per 100. The Ferris Ranch, Rt. 2, 144 D. Pomona, Cal.

MACFARLANE STRAIN WHITE LEGHORN Cockerels.—April hatched. Hoganized. \$1.00 each, \$9.00 per dozen. Chicks to order, 10c each. Newton Poultry Farm, Dept. 1, Los Gatos, Cal.

BARRED PLYMOUTH ROCKS.—"The kind that Win and Lay." Eggs for hatching and choice stock for sale. Have bred Barred Rocks for over nineteen years exclusively. Write for catalog showing winnings at California's leading shows. Chas. H. Vodden, Box 396, Los Gatos, Cal.

THE SANTA CLARA VALLEY HATCHERY solicits your orders for Fall and Spring delivery in 8 breeds of baby chicks. Order early and get the best. Jos. A. Bihn, Lincoln Ave., San Jose, Cal.

FOR SALE.—R. I. Red Pullets, 5 mos. old. Good stock. White Indian Runner ducks, full feathered; fine laying strain. Prices reasonable. Mrs. B. D. Kellogg, Richfield, Cal.

EASTMAN'S REED TO LAY Barred Plymouth Rocks, Chicks, Eggs, Cockerels. Fairmead Poultry Farm, Fairmead, Cal.

DAY-OLD CHICKS.—These chicks are hatched from our own flock of 8,000 Utility White Leghorn Hens. George Bros., Petaluma, Cal.

Lock Seamed and Soldered

There is a tremendous difference in surface pipe. This is appreciated most by the man who has wasted time and money on inferior makes. If you want absolutely the strongest and best surface pipe you can buy, select

Madewell Surface Pipe

It has many distinctive important advantages you can't afford to overlook. The Madewell Long Lock Seam is made doubly sure and strong by soldering the entire length. A better seam can't be made. The Madewell Lock Seam Sleeve—used in Madewell pipe only—is decidedly stronger and smoother than the old fashioned lap and riveted seam used in other pipe. This feature alone puts Madewell Pipe in a class by itself.

Send for Free Booklet—which tells just how Madewell Pipe is constructed

Robinson Hardware Co.

Box B

Gilroy, Cal.

Madewell Pipe received highest award at all State and Fresno District Fairs since 1913.

FLORAL DEPARTMENT.

[By Geo. N. Tyler.]

I have just returned from a month's outing in Glenn county, which will account for the non-appearance of this department. During that time a number of queries have come in which will be answered by mail. Regarding seeds—I do not carry them, but they may be procured in bulk or packet at any of the larger seed houses.

Chrysanthemums are now setting buds. You can take most any bud from now on to form your flowers. Your plants, if growing to single stem, will, as soon as they set buds, send out shoots from every leaf. Keep these picked off. It is a good plan to let your plants go on the dry side when you take the buds, and do not water till the bud begins to swell, then give manure water twice a week. Have it weak at first, but make it stronger at every watering, also give nitrate of soda, 1 lb. to fifty gallons of water, once in ten days. Keep the foliage sprayed to keep down thrips and aphids, but do not spray or fertilize after the bud shows color, just water carefully till the flower matures. If you wet the buds or flowers, they will rot and all your work will be for nothing. If you fertilize too long it will bleach your flowers and make some of them come malformed. I do not advise the use of nitrate on any of the pink varieties.

Pelargoniums that are in pots and have been gradually dried off for the last six weeks are now in the right condition to cut back. In cutting back, if they are old plants, cut within one or two joints of last year's pruning. If they are this year's plants, cut back to from four to six inches of the pot. Do not be afraid of pruning too close. Every piece you cut off will root. Tip cuttings are good, but two eye cuttings are better. Pot the cuttings made in two and a half or three inch pots, using a sandy soil. Pot them firm and give a thorough watering after potting. Put them in the shade and water sparingly, until growth starts, then pot on as they need it. They must be protected in winter. You can also root them in clear sand same as any cutting and pot up as soon as rooted. The old plants that were cut back should be stood out in the bright sun and allowed to go dry, but the tops should be sprayed twice a day, to make them break, or make new growth. After the breaks have made a growth of about one inch, knock them out of the pots, shake off all soil, trim back the roots and pot them in vessels two sizes smaller than they have been growing in. After they have filled it with roots, repot in larger size as they require.

ARTISTIC BOUQUETS.

A short time ago, a great effort was made to have bouquets of all one variety of flowers and preferably of one color, but now, the harmonious combination of colors is much seen in the florists' windows. One of the most effective was a combination of the zinnias in shades of red, with hydrangeas in shades of blue. This year all the old-fashioned flowers have had a revival of popularity, and anyone with an old-time

garden is much to be envied by her city sisters. Shasta daisies and coreopsis make a beautiful combination and so does the coreopsis and bachelor-buttons.

RECIPE FOR EGGPLANT.

Remove the skin and cut the plant into slices, one-fourth an inch thick. Sprinkle the slices with salt and pile them, one above another, and put a weight on top. Let stand an hour to draw off the juice. Drain, dip in egg, then in bread crumbs and saute, first on one side and then on the other to a golden brown. The word saute means to fry in shallow fat. Frying, properly used, means cooking in deep fat.

RAISIN FRITTERS.

Mix together one-half cupful of water or milk, the well-beaten yolks of two eggs, one teaspoonful of sugar, one saltspoonful of salt and flour to make a good batter; add one tablespoon of olive oil or butter and beat with an egg beater until smooth. A small teaspoonful of baking powder may be sifted with the flour. Just before using, stir in the stiffly beaten whites of the eggs. Have some seeded raisins soaked until soft, stir them into the batter and drop by spoonfuls into smoking hot cooking oil and fry a light brown. Drain well and roll in sugar.

PACKING BUTTER TO KEEP.

Editor Home Circle: I would like to know if you can tell me some sure way of packing down butter so it will be good to use on the table this winter. I enjoy The Home Circle, and we have taken the Rural Press about ten years. — Mrs. C. D. H., Santa Cruz.

Butter that is to be put down for winter use should have two ounces of salt added to it for each pound, and the buttermilk must be worked out very carefully. After this has been done, pack solidly into stone jars or crocks, leaving room enough at the top to permit of at least two inches of cold, strong brine to be poured on. Cover carefully with a strong cloth and fasten securely.

CORN SALAD.

[Contributed by Mrs. C. D. H., Santa Cruz.]

Eighteen ears corn (boiled and cut off); 1 large cabbage; 5 green peppers, 5 large onions, 5 cucumbers, 1 doz. green tomatoes, 2 bunches of celery, 2 cups brown sugar, ½ cup salt, 1 quart vinegar, mustard and celery seed to taste. Grind green things. Put the salt through them and let stand over night. Boil in the morning, add corn, sugar, seed and vinegar and boil until done. Then can in glass jars and seal.

THE HOME CIRCLE

THE BIRTHDAY CAKE.

Select from alphabet noodles the letters of children's names, dates, etc., and place in a dish in which a quarter of a tablet of gelatine-coloring has been dissolved in a table-spoonful of cold water. When letters are colored, remove to a clean cloth to absorb extra moisture; then arrange on top of frosted cake. Children are delighted to have their names on their birthday cake.

INDIVIDUAL APPLE CUSTARD.

A dainty little dessert is the individual apple custard. To make this, heat one pint milk, separate two eggs. Into the yolks beat three tablespoons sugar, one tablespoon cornstarch and a pinch of salt. When at the boiling point, remove the milk from the stove and pour it slowly into the egg mixture. Return to the fire and cook to the consistency of boiled custard. Into this custard stir one and one-half cupfuls of raw grated apple and one teaspoonful of lemon extract. Pour into molds and pile on top of each the whites of eggs beaten stiff, combined with sugar and put in oven to brown. Serve either hot or cold.

ANOTHER PEAR SALAD.

Editor Home Circle: In a recent issue of the Press, there was a recipe for pear salad. As I have one that I think is much better, I am taking the liberty of sending it in, hoping that it can be used. Take pears that are firm and peel and core—either drop into water that has lemon juice in it, or take a cut lemon and rub over the surface to keep it white. Place your lettuce leaf on the salad plate and on it put a teaspoonful of mayonnaise to which has been added a small amount of ground salted almonds. Over this put one-half your pear, core side down, so the rounding surface is up. Take salted almonds and put in rows half an inch apart the length of the pear. A clove stuck in at either end makes the finish of what is called a Porcupine salad, and which is both good to eat and to look at. Canned pears, well drained, can be used when fresh ones are out of season. — Mrs. F. G. B., Manteca.

NEEDLE NOTES.

Scarfs of Scrim.—The busy housewife will find that dresser scarfs of scrim do not catch nor show the dust like linen or heavy material. Hemstitched with a border of crocheted lace, they are quickly made, durable and easily laundered.

When Sewing Needles Rust.—If your sewing needles rust and cause annoyance, try using either linen or chamomile leaves in the needle book, instead of flannel.

SOFT MOLASSES COOKIES.

One-fourth cup sugar, ½ cup shortening, one cup sour milk, one cup molasses, 1½ teaspoons soda, 1 teaspoon salt, 1 teaspoon each of ginger, and allspice, 2½ cups flour. Cream butter and sugar and add the sour milk. Mix the salt, ginger, allspice, and 2 cups of flour together. Mix the soda and molasses and pour it into the milk and sugar mixture. Add the flour, beat thoroughly, then add the rest of the flour until the dough is stiff enough to roll. Bake for about twelve minutes.

MRS. BEST'S LETTER.

My dear Friends:

Here in California the outdoors life appeals to all of us so much that picnicking is something every family does. A large part of the success of a picnic depends on a suitable and satisfying luncheon and to prepare it is quite a task that should not fall on one member of the family alone.

Sandwiches of one kind or another usually form the basis of the meal and any child over twelve should be able to follow directions and make them.

Cold meat sandwiches are always enjoyed, but you will find them much more appetizing if you add either chopped pickle or sliced cucumber pickles.

Lettuce, carefully washed and dried and covered with mayonnaise dressing makes a very refreshing sandwich and there are innumerable combinations of olives and nuts, cheese and pimiento, tuna fish and celery, peanut butter and jelly.

To be real dainty your bread must be cut thin and the crusts removed, but you must consider the appetites of your family and if they are hearty eaters, do not, I beg of you, try to fill them up on sandwiches that are suitable for an afternoon tea. If the butter is slightly warmed and then stirred into a cream, it will spread much more easily and not tear the bread.

If you are going to have an open fire at your picnic spot, make cheese sandwiches of a good Eastern cheese and substantial slices of bread and toast them. They are certainly delicious.

If you are taking hard-boiled eggs, they seem much more attractive if they are deviled and then fastened together again with toothpicks and each one wrapped separately in oiled paper. Oiled paper is certainly a friend in need when putting up lunches and the continuous roll permits of cutting just the length desired.

A salad is a nice addition to a lunch and the number of dishes carried is immaterial when the picnic party is not walking. A very dainty way to serve individual salad is to hollow out a long finger roll and fill with the salad mixture. If you are skillful, you can manage to eat that from your hand.

Doughnuts, drop cakes or cookies are much easier to serve and eat than a frosted layer cake and taste equally as good.

You can have fancy paper tablecloth sets consisting of tablecloth, napkins and fancy paper plates; but the economical way to do is to use plain white paper napkins and plates and buy them by the hundred. In that way, you always have a supply on hand.

Many people use the small blue-bordered cloth Japanese napkins and keep them in a box of some sort that is used to hold picnic equipment. If you have enamel cups for your coffee and grape juice, that eliminates the danger of breakage, but if you are serving hot drinks, do have something with a handle.

The vacuum bottles on the market make it possible to have a hot drink with no effort, but making coffee over an open fire has its fascination as well as its drawbacks.

Rosabella Best.

IT COULD BE WORSE.

Once there lived an optimist,
Whose heart was always gay;
"It could be worse, it could be worse,"

Off he was heard to say.

Once the devil picked him up,
And for want of horse and hack,
Started off to hades with him,
Carrying him on his back.

Those who saw him riding off,
And noticed where he sat,
Exclaimed, "What under heaven
Could be worse than that?"

The rider smiled serenely,
Then said, "'Tis plain to see;
I am riding the devil—
He could be riding me."

—J. W. McCord.

JAMIE'S SHOPPING.

Jamie took up the clean blue blouse that his mother had laid out for him to put on before going on an errand for her.

"Mother, are all my blouses blue?" he asked.

"Why, yes, dear, I believe they are," his mother said. "All except the white ones that you have for best."

Jamie slipped his arms into the blouse sleeves and went over to the mirror to fasten the front buttons.

"Why do you want to know, dear?" his mother asked.

"I was thinking," said Jamie, "of the pink stripes in Harold's new blouse—a big pink stripe with a tiny one close beside it. Oh, they're just beautiful! And they go round the other way down at the ends of the sleeves."

Jamie's mother looked at Jamie for a moment with a smile. "When you go down to the store for my thread," she said, "how would you like to choose the material for a new blouse?"

"Choose just what I'd like?" cried Jamie, turning swiftly from the mirror. "Oh, do you suppose they would have something with pink stripes?"

"I think so," said his mother. "Yes, you may choose just what you like, and I will make it up for you."

Half an hour later Jamie stood in front of a counter in the dry-goods store, and looked at the rows of goods on the shelves: he saw a piece of cloth that might have been the very one from which Harold's new blouse had been cut. There were the pink stripes, big and little; Jamie could see how they would look going round at the ends of his sleeves.

"What will you have this morning, Jamie?" a girl behind the coun-

ter, whom Jamie knew as Miss Proctor, came over to ask.

"I want a blouse—I mean some cloth for a blouse," said Jamie, backing away a little from the hand that Miss Proctor tried to put under his chin.

"Oh, doing your own shopping, are you?" said Miss Proctor, laughing. "Well, I happen to know what little boys like for blouses, particularly little boys with blue eyes. There, isn't that pretty?"

Miss Proctor had reached up while she talked, and lifted down a piece of goods that she spread out for Jamie to see. The cloth was blue, as blue as the bluest of Jamie's blouses.

"Don't you think that's pretty?"

"Yes, it is," Jamie agreed politely.

"But perhaps your mother told you to get some special piece," Miss Proctor said as she lifted her scissors.

"Oh, no!" Jamie said hastily. "She said I might get anything I liked."

"That's lovely!" Miss Proctor exclaimed. "Well, I'm sure you'll like this. See, it exactly matches your eyes!" And she leaned over to hold a fold of the goods under Jamie's chin.

She was standing directly between Jamie and the pink-striped goods. Jamie did not know what to do.

This blouse that I have on is blue," he murmured.

"Yes, I see," said Miss Proctor, smiling. "How many yards does it take to make you a blouse, do you know?"

"Mother said two yards and a half," said Jamie. "I have several blue blouses at home," he added, as he saw Miss Proctor lift her scissors again.

"Have you?" said Miss Proctor, absently.

Snip! Jamie did not know that scissors could go through cloth as fast as Miss Proctor's scissors went through the blue piece. They were only a bright streak. And then there was Miss Proctor sticking them into her pocket again, and folding up the two and a half yards of goods, while she said in a business-like way, "Anything else?"

Jamie swallowed hard. "N-o-o," he said. "Oh, yes, there was! I want two spools of white thread, number sixty. And mother said to please send the slip inside the package."

Jamie stood still while Miss Proctor went to get the thread. He could see again the pink-striped goods on the shelf. He blinked and tried to turn his eyes another way, but they came back. He jumped when Miss Proctor spoke close to him, "What are you looking at, Jamie?"

"Why, only that piece of pink-striped cloth," Jamie confessed.

Miss Proctor stood tapping her lips with the points of her scissors. "Did you say," she asked, with a queer little smile, "that you have another blue blouse at home?"

And then all at once it seemed not to matter that the piece of blue cloth had been cut,—at least Miss Proctor said that it did not matter,—and there was another quick flash of the scissors, and Miss Proctor rolled up the thread inside two and a half yards of the pink-striped cloth, while she laughingly agreed that the big

and little stripes would be beautiful going round the ends of the sleeves.

Jamie hugged his little bundle close and stood still by the counter for a moment with Miss Proctor's hand under his chin. He did not try to turn away as he had done be-

fore.

"I think," he confided, "that I must have had hundreds of blue blouses! Maybe not that many," he corrected himself, "but all of them except the white ones have been blue—till now."—Stella Dysart, in the Youth's Companion.

She'll be tea-happy

She has sent for the Taste Packet and now she is finding out which Schilling's Tea just exactly suits her. Please don't misunderstand—there is only ONE quality of Schilling's Tea, but there are four distinct taste-types. Whichever you like best is the kind for you to use; all four of them brew tea of indescribable charm.

Send for the Taste Packet

The only simple, sure way to get the right tea.

Contains four parchment envelopes of Japan, English Breakfast, Ceylon, Oolong—enough for five or six cups of each.

Mailed promptly on receipt of 10 cents (stamps or coin).

GOOD HEALTH.

[By H. E. Pastor, M. D.]

Death from a Wasp Sting.

We read in a recent number of the Medical Times of a man dying from a wasp sting. It is reported that he was stung while sleeping on board a ship, and that he died the day following. This is a very unusual case, and interesting because unusual. The examining physician ventured the opinion that death was due to bacterial infection. A further opinion may be ventured that if the victim's system had been in a healthy condition—in other words, if there had been no blood dyscrasia—the infection would have been less severe, and death perhaps escaped. A pin-prick has been known to cause death where the blood-current has been permitted to become badly befouled. Keep this life-current pure—not with the bottled article from the dusty, musty shelves of a drug-store, but by breathing fresh air at all times, drinking plenty of unpolluted water, and eating wholesome food in moderate amounts—and not forgetting the bathtub.

A Few Words on Infantile Paralysis.

Infantile paralysis (or poliomyelitis, as it is technically known) has been the principal theme of popular medical discussion during and since its appearance in epidemic form in New York a few months ago. This dread disease has not yet gained a foothold in our own State, unless we credit vague rumors of a few isolated cases in San Francisco and at interior points nearby, and probably will not if proper preventive measures are taken by the public health authorities, reinforced by the heads of families, whose children may be imperiled by neglect. The cause of this malady is not definitely known, though a certain species of biting stable-fly is thought to carry the virus, which invades the nose and throat of children especially (though adults are not altogether exempt). The infection later reaches the anterior part of the spinal cord, which atrophies or waste away, and through the nerves branching from the affected parts of the cord the trouble at last reaches the co-ordinating muscles. These muscles become paralyzed through lack of innervation, the contiguous bones lose their vitality, and a general arrest of the growth of the limb results. Club-foot is one of its commonest sequels. In favorable cases complete or partial restoration of the affected parts takes place in a few weeks or months. In the present epidemic at the East the death-rate has been very high—about 20 per cent. As the cause of the disease is not known with certainty, so there is no known cure. Preventive measures are the best safeguard when the disease threatens. Sustain by all means the bodily vigor of the child by proper nourishment and hygienic attention. Forbid association with other children from affected districts, especially in indoor places, as schools, churches, house parties, etc. Destroy all rubbish and garbage, and banish the fly. If your child shows symptoms of the disease (sore throat, headache, fever, pain in the back and limbs, dizziness), call in a physician at once.

Take Advantage of Present Prices for

FISK Non-Skids

THERE has never been a time in all our manufacturing experience when Fisk Non-Skids have represented more tire value to the car owner. Their mileage returns this year are truly remarkable. Fisk Quality has never before been such a good tire investment—and car owners have never been so quick to appreciate this, the demand for Fisks today being even greater than last year, to that time the biggest of our seventeen years experience.

But notwithstanding this proof of Fisk Quality, and their heavy traction tread, *Fisk Non-Skids cost less than the plain tread styles of several other standard makes.* You can buy your Fisks now for the Fall and Winter at these prices and get the best tire value on the market.

More Than 35,000 Dealers 125 Direct Branches

There is Fisk Free Tire Service, too. Through your regular dealer you are sure of the promptest attention from the Fisk Branch nearest you. If you are handy to that branch, be sure to call and make use of this unique and unrivalled FREE Tire Service. Dismounting, inspecting, testing, inflating, assembling, mounting extras, inspecting wheels for alignment, advice on the care of your tires, and so on—all FREE, whether you use Fisk Tires or not. There is no charge except for actual repairs and supplies. No other Tire Service Policy is so liberal.

PRICES QUOTED
AS PAID TO
PRODUCERS

San Francisco, Sept. 6, 1916.

Wheat.

The settlement of the railway trouble and continued foreign buying, with light offerings, have caused a further advance in the East, and there is nothing in war conditions to indicate a drop in the near future. Coast markets have responded, most grades here having found new high levels.

[f. o. b. San Francisco.]

Red seed2.00	@2.10
White1.75	@1.80
Black seed3.00	@3.25
Texas Red seed2.25	@2.35

Corn.

Eastern remains quiet, with little offered, and milo is nominal, being cleaned up at the moment. Egyptian is moving well at a slight advance.

[f. o. b. San Francisco.]

Eastern Yellow, ctl.\$2.05	@2.10
Milo MaizeNominal	
Egyptian1.95	@2.05

Beans.

Several varieties show quite a sharp reaction from last week's advance; but quotations are little more than nominal, as nothing but rather scarce recleaned stock is offered here. Most buying interests seem to have covered their requirements for the remainder of the season, and business is dull; and with the new crop coming on in a couple of months there is nothing to indicate any renewed advance before that time.

[On wharf, San Francisco.]

Vegetables.

Market continues rather heavily loaded with many kinds of garden truck, and the few changes are downward, the demand being insufficient to clean up the offerings from day to day. Alameda celery is offered a little more freely at easier prices. The market is fairly flooded with tomatoes, and 50c is top price for even strictly fancy stock. The surplus is being taken by canners, who keep the price from going below 25c. Cucumbers are a drug on the market, and summer squash is lower. Bell peppers and eggplant move fairly well at the former low level. Green corn, beans, and peas fairly steady.

Butter.

With England and outside domes-

tic markets bidding for supplies from this district, prices have taken a little jump, and are now considerably higher than last year. The recent advance was expected to check the movement to England, but 40 cars were shipped during the past 60 days and 5 cars now ready to go. Los Angeles is actively in the market, and some northern points are also sending in orders.

Extra30	31	30	—	20	28 1/2
Prime 1sts29	29	29	—	28 1/2	28 1/2
Firsts28	28 1/2	28 1/2	—	28	28

Eggs.

Prices have advanced sharply in the last week, as receipts from nearby points are steadily decreasing, and there has been considerable demand for shipment to northern and Island points. Of course a good deal of Eastern stock is offered, but it has little effect on extras.

Extras35 1/2	37 1/2	37	—	37 1/2	37 1/2
Sel. Pul.32	33 1/2	32 1/2	—	32 1/2	32 1/2

Cheese.

Flats have picked up a little, but other varieties continue to come in freely, and there is not enough demand to give any firmness to the market.

Deciduous Fruits.

As expected, the end of last week brought a heavy overstock here, with supplies in some lines two or three times as large as for the previous week, so that even an exceptional demand failed to effect a cleanup. However, the surplus apples went into storage, and the canners cleaned up the peaches, while pears and grapes took a slump.

The situation has now cleared in good shape, with the surplus moving East, where the demand is very strong; values here are about normal. Gravenstein apples are about gone, but later varieties are accumulating, though there is a very good current movement. Pears are slightly easier than last week, and quinces are offered more freely. Good lots of peaches are considerably firmer. Black figs are off again, while nectarines are higher, with a wide range. The top figures on berries have been generally reduced. Cantaloupes are easier, casabas and watermelons being steady. All lines of grapes are lower, with continued heavy offerings, though there has been a heavy movement.

Dried Fruits.

[Net to growers, bulk basis, f. o. b. shipping point.]

With the danger of a railroad tie-up out of the way, and with growers apparently holding as firm-

Special Deciduous Market Report.

By J. L. Nagle.

Sacramento, Cal. Sept. 5, 1916.

The embargo recently placed by the transcontinental lines on perishables, including fruits and vegetables for interstate shipment, was in my judgment a benefit to the fruit industry, in that it lasted only three days, which enabled the markets to clean up the heavy offerings rolling and on track and gave the grapes an opportunity to color and sugar. I have every reason to believe that from now on the market on Tokays and Malagas will return very satisfactory prices.

The demand for pears and peaches is not as active as it was a week ago, due to the heavy shipment of Bartlett and other varieties from the Northwest and Elberta peaches from Colorado. However, California has

not experienced any loss on account of this competition as the balance of the peach crop has been disposed of to the canneries at satisfactory prices.

The following prices have ruled for the week:

New York.—Malaga grapes averaged \$1.20; Thompson Seedless, \$1.15; Tokay, \$1.65; Bartlett pears, \$2.90; Orange Cling peaches, \$1.35; Lovells, 84c; Kelsey plums, \$2.09; Grand Dukes, \$1.90; Gross, \$2.00.

Chicago.—Bartlett pears, \$2.49; Malaga grapes, \$1.17; Tokays, \$1.36; Phillips Clings, \$1.07; Kelsey plums, \$1.78.

Total shipments to Sept. 2, 10, 116 cars; total shipments, same date 1915, 7939 cars.

Special Livestock Market Report.

San Francisco, Sept. 6.

Cattle.—Last week more cattle than usual were accumulated on account of the strike menace. The first shipment of Nevada cattle for the season is coming this week. They are good and desirable weights. All the rest are from California ranches.

Hogs are still freely offered including a lot of poorly finished stock which packers would prefer not to buy. One car today included 38 feeder hogs which the shipper had been warned against sending. Sacrifice prices were paid for them. Packers favor well finished hogs at the top prices rather than poor quality and small size which keep prices down and do not make satisfactory pork.

Sheep.—Most mutton stock is spring lambs, though one shipment of 1200 California wethers is being

received from San Joaquin county.

Wool.—No change in local prices. London sales opened with defective wools lower, crossbreds higher and merinos even with last sale.

North Portland, Ore., Sept. 4.

Cattle.—With 950 cattle here today, it was a very brisk trade. Very heavy demand from feeders. Ordinary and fair grades sold on a little higher basis while prime steers at 6.75 for several lots. Cows and heifers meet good demand at steady prices.

Hogs.—Hog trading slow. A moderate run of 2400 head received. Bulk of sales 9.55 to 9.65. Demand was limited.

Sheep.—A very good demand continuous for choice lambs and sheep. A load of choice lambs sold Saturday at 7.45. Yearlings selling at 6.50; with bulk of ewes at 5 to 5.50.

ly as ever, the local packers are beginning to take more interest in offerings, and considerable buying has been done in the last few days. This is about what has been expected, and it is believed that the next few weeks will bring a fairly large Eastern movement, as the trade there is becoming pretty well assured that prices will not be lower, all the cheap offerings having been bought up some time ago. As for peaches, the growers' association has announced its prices as follows, per lb.: Standard yellow, 5 1/4 c; choice yellow, 5 1/2 c; fancy yellow, 6 1/4 c; extra yellow, 7 1/4 c; standard Muir, 5 1/4 c; choice Muir, 5 1/2 c; fancy Muir, 6 1/4 c; extra fancy Muir, 7 1/4 c; choice peeled, 8 c; fancy peeled, 9 c; 1/2 c extra for 50-pound boxes; 5/8 c extra for 25-pound boxes unfaced; 7-8 c extra for 25-pound boxes faced. The quotations are subject to a 5 per cent discount for packing and selling. The Association controls most of the output, and packers are taking very little interest, having reduced their offers to a lower level. Apricots and prunes have been marked up again, and growers around San Jose report sales at even higher prices than those quoted in San Francisco. The same condition was noted last year. Raisins continue very strong.

Apples, new crop 4 1/2 @ 5 1/2 c
Apricots, per lb. 1916. 11 1/2 @ 12 1/2 c
Figs, white, 1916 5 @ 5 1/2 c

Sultanas, 50-lb. cases, per lb. .8 c

Citrus Fruits.
The embargo on shipping citrus fruits East, placed by the railways last week, in anticipation of the strike, lasted but three days and did no damage to the industry. Shipments are now going forward as usual and the fruit is commanding good prices. Valencia oranges averaging nearly \$5 per box and lemons around \$7. Total shipments for the season up to Sept. 1st were 29,212 cars of oranges and 6,366 cars of lemons. From all indications the balance of the fruit to be shipped will command good prices, making 1916 the banner price year. Fancy grapefruit is slightly higher in the San Francisco market, with lemons lower. The local movement of oranges and lemons is seasonably rather light.

Oranges, Valencia, fancy, box \$3.75 @ 4.00
choice 3.35 @ 3.50
Grapefruit, fancy 3.25 @ 3.75
choice 2.50 @ 2.75
Lemons, fancy 6.50 @ 7.00
choice 5.75 @ 6.25
standard 4.00 @ 4.50
Lemonettes 3.00 @ 3.50

Honey.
Values are pretty firmly maintained, with little offered for shipment to this market, and no large accumulations reported. [Wholesale prices, San Francisco.]
Water white, comb 13 @ 15 c
Amber 10 @ 12 c
Water white, extracted 8 @ 9 c
Light amber, new 6 @ 7 c
Dark 3 1/2 @ 4 c

Nuts.
Packers are still offering the prices last quoted for almonds. The Growers' Exchange will put out new prices by Sept. 15, and announces that the crop promises the best quality ever produced in the State, while quantity of Nonpareils and Drakes will be very short, with a normal crop in less important varieties. New walnut prices are expected in a few weeks, and there is a strong demand in the East, owing to the close cleanup of old stock and reports of short crops in Europe. Growers are said to be taking a very firm view as to values.

Almonds, 1916:
Nonpareils, lb. 17 1/2 c
I. X. L. 15 c
Drakes 13 c

Horses.
The city market remains rather sluggish, and recent offerings have failed to sell off as rapidly as expected, though most of the business continues to be done within about the range quoted, as there is too much competition among buyers in other quarters to warrant offerings on any lower basis. Another large stable sale was held this week, and there are also fairly large offerings of stock fresh from the country.

[Approximate values in San Francisco, based on auction sales.]
Drafters, 1700 lbs and up \$ 250
Drafters, 1550 to 1650 .. 150 @ 200

Publishers' Department.
S. C. Sorensen of Tres Pinos writes us saying: "Your paper has many valuable articles, as my scrap book will show."

W. S. Guilford was elected president of the Western American Berkshire Congress, Monday night. The meeting was continued Wednesday night at the Travelers Hotel.

I have found that the Pacific Rural Press is the best advertising medium on the Pacific Coast. It reaches the class who have money and inclination to buy.—W. M. Carruthers, Mayfield.

Fire and water damaged the office of the Pacific Rural Spirit, at Portland, last week, to such an extent that the paper had to be printed in outside offices. We trust our friend Browne may soon have the wreck of his office into shape, that the getting out of his good stock paper will be a pleasure to him and a joy to its readers.

Albert M. Hart, of Clements, writes us that: "I am very well pleased over the fact that a large per cent of my inquiries come from

your paper, and intend if possible to carry a larger ad. this year and using a cut of my turkeys."

Ernest L. Owen, Secretary of the Ranchers' Market of San Diego, writes: "We are getting busy with the marketing problem down here and expect to have something of real accomplishment to report from time to time. Personally I find much that is helpful along this line in the Pacific Rural Press, and wish that every one of our members and every member of the County Farm Bureau could be induced to take it and enjoy that help."

Thirty-two pages in this issue are made necessary to care for the articles furnished by our writers and the advertising offered by our patrons. Next week's issue will also be 32 pages and the extra columns of the paper will be devoted to printing the State Fair awards and some very valuable dairy matter. One of the articles will be from the pen of Prof. Wickson, covering the history of dairying in California. It will be worth your careful reading.

The Wisconsin Condensed Milk Co., Burlington, Wis., just received a deep well Turbine Centrifugal Pump from Los Angeles. Los Angeles as a pump manufacturing center is becoming quite well known throughout the East, due to the Oil Balance Thrust Bearing which is capable of carrying almost any weight. Since the perfection of these devices the Turbine Centrifugal Pump has become available for lifts never before contemplated. This is strictly a Layne & Bowler Corporation product.

We assist graduates to secure good positions and promotion. We also give a two-year high school course. For information, address WESTERN NORMAL, J. B. Humphreys, Principal, Record Bldg., Stockton, Cal.

WE WILL PAY YOU \$120.00 for congenial work in your own community. 60 days or less. Man or woman. No capital required. Opportunity for promotion. Spare time may be used. Full particulars free. International Press, 302 Winston Bldg., Philadelphia.

WANTED—Industrious, responsible man with family to farm ranch under ditch near Oakdale on shares; 120 acres, 40 in alfalfa. Address Box 29, Pacific Rural Press.

WANTED—Reliable solicitors for country paper. Must furnish bond. 217 Underwood Building, San Francisco.

WANTED—Young man with three years' University training in agriculture desires position on grain, fruit, or stock ranch. Box 28 Pacific Rural Press.

COUNTRY LANDS.

RANCH FOR SALE—50 head of horses and machinery. 2000 acres of rich, sandy loam land for sale, on the east shore of Washoe Lake, Nevada, between Reno and Carson City, 1000 acres being cultivated, in alfalfa, grain, and potatoes. The land is irrigated by a 400 H. P. Hydro Electric Pumping Plant, which belongs to the property, and the cost of pumping is less than 60 cents per acre. Fine cattle and sheep range outside of ranch property. Will sell this property as a whole or in small lots. Water right of 2000 inches goes with the land. Address W. G. Douglass, Virginia City, Nevada.

FOR SALE—In the heart of California, 560 acres eighteen miles from Sacramento; no bed rock or gravel proposition; but deep, light adobe and red soil. The choicest of upland, finely situated for subdivision. Very little leveling to plant alfalfa; water never lower than 14 feet in driest season. Address Box 533, R. F. D., Route 3, Elk Grove.

WANTED—Farms, large and small, in all parts of the State. Our system of placing owners in direct communication with buyers has brought us hundreds of applications for farms. What have you to offer? Write for our listing blanks. Western Farms Bureau, 660 Market St., San Francisco.

INFORMATION free about State Government land now open; different counties and States. Write your wants. Joseph Clark, 1511 K St., Sacramento.

FOR SALE—186 acres in Yolo's fruit, grain and alfalfa section. Living water. Suitable for subdivision. Address John Winter, Tancred, Cal.

FOR SALE—36 acre ranch, well improved. For particulars, address W. K. Wheeler, Knight's Ferry, Stanislaus Co., Cal.

Napa County Farm Bureau

FAIR

will be held at Napa
SEPTEMBER 14, 15, 16.
Thursday, Friday,
Saturday

Come and see the products of the Beautiful Napa Valley. Big Parade, Livestock Show, Barbecue, Dancing, Fireworks, etc., etc. Something doing all the time.

Send for Prize List.

H. J. BAADÉ,
Director General.

DR. BEN STETSON,
President.

Bumper Grain Crops

Good Markets — High Prices

Prizes Awarded to Western Canada for Wheat, Oats, Barley, Alfalfa and Grasses

The winnings of Western Canada at the Soil Products Exposition at Denver were easily made. The list comprised Wheat, Oats, Barley and Grasses, the most important being the prizes for Wheat and Oats and sweep stake on Alfalfa. No less important than the splendid quality of Western Canada's wheat and other grains, is the excellence of the cattle fed and fattened on the grasses of that country. A recent shipment of cattle to Chicago topped the market in that city for quality and price.

Western Canada produced in 1915 one-third as much wheat as all of the United States, or over 300,000,000 bushels. Canada in proportion to population has a greater exportable surplus of wheat this year than any country in the world, and at present prices you can figure out the revenue for the producer. In Western Canada you will find good markets, splendid schools, exceptional social conditions, perfect climate, and other great attractions. There is no war tax on land and no conscription.

Send for illustrated pamphlet and ask for reduced railway rates, information as to best locations, etc. Address

Superintendent of Immigration, Ottawa, Canada, or apply to Gilbert Roche, Canadian Gov't Agt., Canadian Bldg., Exhibition Grounds, San Diego, Cal.

LOS ANGELES

The Dairy: An American Gift to Calif.

Thirteenth of a Series of Sketches in Which the Editor Presents Suggestions, Drawn From Long Experience, of What Californians Have Done and May Do for the Advancement of California Agriculture.

DAIRYING was the most strikingly novel thing which Americans introduced to the agriculture of California, which was about three-quarters of a century old when the pioneers intruded upon it in 1849. The Spanish and near-Spanish people who laid the foundation of California agriculture had plenty of cattle, but their activities with the ox (*Bos bovis*), both industrial and social, rested chiefly upon the male of the species and the female was little more than incidental thereto: cows were kept to get more bulls and steers. Quite in contrast were the policy and practice of the north European nations, whence Americans were largely derived: with them the cow was the essential industrial factor and the bull was incidental—bulls were kept to get more cows.

This difference in the point of view explains the fact, which is recorded by many travelers, that before the American occupation, though cattle were abundant and labor was to be had for the commanding, there was practically no dairying. Milk was rare, but the poorest settler had plenty of beef in his pot. The mission padres had an abundance of olive oil to take the place of butter and they drank wine instead of milk and other drinks to which milk is accessory. But it is not true to say that they had absolutely no dairying, for one early visitor testifies that the pre-Americans did have milk, but it was drawn from goats, which he counted poor, for it was difficult to get a pint of milk from six of them. Hardly less significant of the absence of a dairy industry was the testimony of the cattle of the hide-and-tallow breed of the Mexicans, of which it was said: "To get any milk at all the cow had to be lassoed, tied to a stake and allowed the company of her calf before a drop could be had."

Americans Brought Good Cows.

—Although the hunters and trappers who settled in California before the gold discovery probably had cows somewhat broken to milk, the first good cows to reach California in any number were those led or driven across the plains by the gold-seekers of '49. And there were a good many of them. They were fed or grazed along the trail and contributed to the family menu on the way. They were probably the best cows the pioneers had or could find in the places whence they came because no one would choose a poor cow to travel with, though he might be content to keep her too long at home. Such cows were the foundation stock of pioneer dairy efforts in the foothills and mountain valleys of the Sierra Nevada, and pioneers' tales are full of their performances. When a family arrived across the plains it was quite usual for the men to go to gold-digging and the women to milking, and the women often got more gold dust from the cows than the man did from the gravel. Nor were the men long in taking a hint of more gold from the grass tops than from

the roots. In the U. S. Patent office report for 1851, Philip Lynch of Ophir, Placer county, reports on December 3 of that year:

About October 1, 1851, I bought two American cows, fresh with young cows, for \$400. These cows have averaged 12 quarts each per day which I have sold at 50c per quart, totally \$720 for the two months. These cows I have fed on hay at \$80 per ton, meal at \$8 per cwt and potatoes at \$4 per cwt, at a cost of not over \$100 for the two months. I would not sell my two cows for \$1000.

How the Eastern rim of the State was populated by the offspring of these good cows which had walked across the plains is amply shown by early records. Let a single instance suffice. In 1857, Honey Lake Valley, a few miles from American Valley, in which the pioneer town of Quincy is located, produced over 5000 pounds of butter, which sold at 75c per pound; and to show "the exceeding richness of the pasture and the high

character of the dairy stock" it is recorded that Mrs. Taylor, "who personally superintends the whole work, milks only fifteen cows and makes 250 pounds of butter per week, which sells readily at 75c. per pound." Mrs. Taylor must have been a busy woman and yet the record says: "In her parlor we found an exhibition of taste and refinement which would do honor to any family in any place." Thus the dairy industry of California started on a true American economic and social plane, to which it did not always subsequently cling.

The Mexican Foundation.—

Although some of these American cows and their offspring undoubtedly continued their journeys westward until they reached the coast region, and some of the Mexican cows were taken to the mountain regions, it is probably true that the dairies along the coast were chiefly equipped with Mexican cattle. These coast dairies also began work early in the '50s, their opportunities being the San Francisco demand which was also drawing butter by ship from all parts of the world and paying high prices. It was a very rough kind of dairying at first and was carried on, as an old pioneer used to say, "by a lot of men who went into partnership with the calves" as the quick fluctuations in prices made it nip and tuck whether a man would do better by having butter or meat to sell, and so there was an effort to have both ready. But this condition did not last long. The meat demand was met by driving in cattle from the Western states and Texas and this made meat so cheap that four year-olds could be bought for \$10

a head and the dairymen found this stock, though very poor for dairying, better than the Mexicans. For a time dairying with such cattle was profitable. In 1857 there were 130 dairies, of 25 to 200 cows each, shipping from Petaluma. But there came a sharp turn. In 1858 butter was worth a dollar a pound in San Francisco and cheese, made of skim milk and butter milk, sold at 25c per pound, "right from the hoop." Two years later these prices were quartered; the rough pioneer dairying could no longer pay and efforts for better practices and equipment began.

It should be noted however, that even when local dairying was very rough, there were shining exemplars of better things. At some time previous to 1856 J. W. Osborne built in the Napa Valley a dairy house of stone, with plastered ceiling, ventilators and cemented floor. He had

THE WEEK.

ONE of the speakers at the Admission Day celebration at the University of California urged on the university students the study of California, on the ground that the man who does not learn something of his State's history is neglecting his character-building. He declared that California has been a maker of history, that ten years in the West sees more accomplishment than fifty years in the older States, and that every day there are events of high importance.

The speaker, doubtless, had chiefly in mind achievements in statesmanship, and the humanities, generally conceded to be things in which all citizens should be interested; but his appeal should also include all affairs of industrial development and progress. In these also California has been doing new things in new ways for the last 65 years, and the steps by which present attainments have been evolved from pioneer conditions, conceptions, and undertakings should be clearly understood by coming generations. It is upon the foundations laid during the last half of the nineteenth century that the achievements of the twentieth, which we now discern, are firmly established. Just as our rapid advance in legislation for the good of mankind rests upon the foundation of recognition of individual rights and fair play, which the pioneers so strenuously, and often picturesquely, prepared, so our present industries reflect the spirit, the invention and the self-help of the first generation of Americo-Californians. For this reason it is to be expected that California will not only go faster but farther than most other States, and thus translate her wealth of natural endowment of resources and situation, not only into the character of her citizenship, but into the uniqueness and extent of the industries by which her citizenship makes its contact with the world.

WHAT CALIFORNIA IS DOING.

IT IS due to this foundation spirit of enterprise and achievement, both in development of confidence, self-reliance, and thirst for fair play, that California has now its distinctive character in citizenship and in results which this masterful citizenship can work out. And it is a most important fact that the California spirit which the pioneers engendered is not restricted to lineal descent for its transmission. It is an effulgence which may enter and illumine any man or woman who may approach the sphere of its influence, and it will fill any fit being with points of view and achieving power. This is the reason why men and women do so much for their own exaltation in California, and the reason also why they do so many unique things in industry. It is not, therefore, surprising to find them dredging seaweeds for potash and trapping for thousand-dollar silver fox pelts on top of Californian Mt. Whitney—the highest American mountain this side of Alaska. The Californian has sense to know how to raise potash from the bottom of the sea and to pull pelts from the skies. He will go higher and lower than other men in pursuit of industries, because he knows and fears not. And this is the reason why each year's

achievement breaks a record: fruit shipments of this year greater than ever before; livestock displays at the State Fair last week ten times as great as a few years ago; exports from San Francisco last month double those of August last year; Californians departing this life during 1915 at an average age of 51.8 years while in 1911 people stepped out at 48.8 years—making a longevity gain of three years; one-sixth of all the steel ships now building in the United States are in the yards of San Francisco bay—but we could swamp the press with instances. It is all due to what a visiting New Yorker the other day called "no magic but the magic of enterprise; the magic of enthusiasm; the magic that is the spirit of San Francisco." Though, of course, we should say "the spirit of California," for San Francisco is not the source, but only one manifestation of it. And the speaker cited above was right: it is the duty of a Californian to study and to know his State.

THE FEDERAL FARM LOAN BOARD.

THREE members of the national board charged by the new law of congress to develop mortgage credit under government auspices, were in California from Saturday morning to Monday night and attended several conferences concerning the local aspects of the work in which they are engaged. The members thus conferring with Californians were G. W. Norris of Pennsylvania, chairman of the board; W. S. A. Smith of Iowa, and Herbert Quick of West Virginia, members thereof. These three constitute a majority of the board. Mr. Norris is the financial expert; Messrs. Smith and Quick have the agricultural point of view particularly. They all take the work they have in hand seriously: they honestly believe in its feasibility and great public service, and their contact with our banking and commercial citizens, who chiefly participated in their conferences in this State, will be, indirectly at least, helpful in the freer and fairer financing of farming operations. The effort to impress upon the board the desirability of establishing one of the twelve district land banks at some point in California naturally brought to the Sacramento hearing many citizens of general prominence, but there were plenty of farmers present also and some of them traveled long distances to get into touch with this new operation for the capitalization of farmers on more favorable terms than hitherto.

LOCATION OF THE DISTRICT BANK.

AS TO the particular location of the district bank, if we are fortunate enough to get one in California, we are not greatly interested. The places urged upon the board are Sacramento, Stockton, Fresno, Los Angeles and San Francisco. Any of these would answer from the point of view of farmers' direct transactions with the district bank, for there would not be many. The fundamentals of the business are located wherever there is a bunch of farmers self-collected into a loan association or operating through a state bank which meets requirements. The idea is that this initiative should remain with the farmers who are near enough together to know and trust each other. These local associations deal with the district bank, not by their membership individually, but through the officers they choose from among themselves and nothing can go to a district bank unless it is thoroughly understood and endorsed by the local association. When this is done the papers can go to the district bank by mail and the bank will protect itself by securing such examination and appraisal as it sees fit to make to comply with the requirements of the law. Of course the general approval of the security offered and the reasonableness of the purposes of the loan, which must be carefully specified, must rest with the local association, for the members of it are endorsing it and assume a certain share of the responsibility for the transactions they approve. For these reasons the location of the bank is to be determined not by a notion of the individual convenience of the borrowers but for the advantage of the operations of the district bank itself. It should be close to the fountains of law, finance and farming science from which it must draw many facts which will influence its procedure. Its officers

should understand the special needs and conditions of its district and this fact is recognized by the establishment of twelve such banks instead of one for the whole country. It seems to us that California is so distinctive in its natural conditions, in its diversity of productions dependent thereupon, and in its advanced position in development, that the State can fairly claim a district bank somewhere within its boundaries. We are also of the opinion that the northern states of the coast should also be districted by themselves.

WHEN WILL THE BUSINESS BEGIN?

NATURALLY those who are thinking of improving their farming, either by buying new equipment, or by refunding at lower interest and easy payments obligations already incurred and which give them little comfort or chance of paying out, are much interested as to how soon this newly-cleared financial sky will throw down some of the sunshine which they greatly need. There have been some hasty promises made, some of them, perhaps, for political purposes, to the effect that there might be such illumination by New Year's or soon after. Possibly there may be, if the board should decide upon locating some of the banks, without waiting to fill the category and providing some districts should get a lot of loan associations in working shape. Inasmuch, however, as a district land bank must have a capital stock of three-quarters of a million which it is expected will be chiefly subscribed by loan associations and as the United States Treasury cannot subscribe for stock to make up this minimum of three-quarters of a million until other subscribers have been given a month to cover it, it is clear that some time must be consumed in the work of organization—after the loan board completes the specific regulations for operation which the law entrusts to it and which it cannot well do while traveling around looking for sites for district banks. At the California meetings the loan board members individually did not anticipate such speedy start with loans as has been sometimes mentioned. This seems to us reasonable. If a financial operation involving so much organization all the way from neighborhood groups of farmers to a mortgage, bond-issuing, district bank, could possibly be put in shape in a few months, it would be likely to be in poor shape and that is probably impossible under the law. The local loan associations of those desiring to borrow are the foundation, and though there may be doubt as to how soon these may be gathered into effective operation by the district bank there can be no doubt as to the time and place to begin—and that is immediate organization of the loan associations wherever interest exists. We know that some communities of our readers are already at work on that fundamental operation. Every one who is interested should secure documents from the Rural Credit office, U. S. Treasury, Washington, D. C., and these will be found to explain in detail how one should go to work to gather other intending borrowers into the group which the law prescribes and which the government is instructed to honor and to assist.

IMMEDIATE EFFECT ON RURAL CREDIT.

AN IMMEDIATE effect of the journeys of the loan board and the popular welcomes extended to them in all parts of the country, is still more desirable publicity for the general idea that borrowing farmers have not been fairly treated hitherto and they should be exempted from extortionate interest rates and oppressive terms for securing and repaying loans. This idea has been crowding itself upon public attention for several years, as our readers all know. Whether this change in the public attitude toward rural credit has accomplished much in mellowing country lenders we do not exactly know, but we do know that it has accomplished something and will accomplish much more. We have often stated that European testimony is abundant that rural credit plans though at first opposed by old-line bankers, were subsequently approved by them and they freely loaned idle money to the rural credit banks which they formerly impeached and denounced as impossible. It is likely to be the same way in this country; in fact there was a great change in the bank

ers' attitude toward rural credit before the law was passed and this new attitude helped to pass the law even though some bankers shook their heads over some of the provisions of the law. Our observation is that men who have money are much like those who have not, except that they seem rather more comfortable. These men, then, having, in some cases, hearts and consciences, are being reached and converted in their attitude and are really coming to the true doctrine that there will be more money for them in the long run by cuddling farmers than by skinning them. It is always a question as to how fully conversion changes a man and we are not shocked that a banker's conversion should consist in a conviction that he can do the old business better in some other way—and in that he is dead right. In one of his loan board talks Herbert Quick said something like this:

Contrary to expectations, bankers also have shown a friendly attitude to the rural credit act. Apparently they have taken the position that the money lost to them by the placing of farm mortgages in other hands will be more than made up in greater business resulting from placing farmers on a credit plane with merchants and other business men.

This is a point which all those engaged in lending money on any fair line, or doing any other fair line of banking business, should always remember. Rural credit is likely to hurt nothing but sharking. If we are not mistaken the indirect effect of the new loan law on interest rates and terms of loans will help agriculture as much as will result from the direct operation of it.

POSSIBLE INFLUENCES OF THE LAW.

AT SOME of the California conferences with the loan board the belief was expressed that a borrower, of the right force and capacity, might find that the government long-time loan on his holding might improve his credit standing for such short term accommodation as he might need at times in his business. The government will lend only 50 per cent of value on land by strict appraisalment and 20 per cent of insured improvements. The effect of such a loan is to insure title and, by reason of low interest and small payments, to hold a man on the land. His capacity and ability as a farmer are also, indirectly, guaranteed. How much better credit standing all these guarantees naturally give a man! He is of good character, competent, responsible and he cannot be thrown off the land by foreclosure. Therefore for subsidiary mortgaging or for personal credit, the money lender can afford to deal favorably with him and that works well both for borrower and lender. This is a general point which does not need amplification.

A specific possibility in the application of government rural credit to colonization of idle lands under State provision and aid, was shown by Professor Ellwood Mead of the University in his statements at the board hearings. His plan is, as many of our readers already know, to enable the State to take land from private owners at a justified valuation; to make subdivisions; prepare the land for cropping by irrigation or otherwise and sell land and water at near cost to those who meet conditions of character and preparedness for farm success. It is not to catch colonists as they run and let them take their chances of success, but to select those who have the knowledge and force to succeed and to place them under conditions which make success possible. For this purpose the government loan would be available to its limits on land and improvements; and the State, or a private capitalist who wished to operate in the same way with the same requirements and precautions, could safely supplement the government loan to selected settlers who had all the qualifications except enough money for a start. The university agriculturists are of course interested in this possibility because of its bearing upon the chance of getting qualified University graduates on land. It is a very interesting phase of the question. At the present time there are graduates doing all sorts of things to get money for a start on land and they are doing a good thing. It is not planned to lessen personal responsibility in young men but to help those who have already sufficiently demonstrated possession of it.

the Editor

QUERIES AND REPLIES

Inquirers Must
Give Full Name
and Address.

Imperial and Standard Prunes.

To the Editor: What is the commercial value of the Standard and Imperial prunes? Have these varieties been proven and would you advise planting either or both of them in any quantities? Do you advise the planting of the prune on the wild plum root on well drained ground? Is it not true that the trees planted on this root make smaller sized trees?—S. H., Chico.

The selling value of these prunes is high because of size; commercial value, which includes not only selling price but good bearing and low cost of handling, is not known to us. We advise only one class of growers to plant these varieties in quantity and that class is composed of those who have already had experience enough to demonstrate that, under their conditions of growth and handling, they are profitable. We think most planters, who have not convinced themselves, ought to put in some trees of both kinds and watch them carefully. We certainly do not advise planting either of them in quantity until some things of their character and behavior are cleared up. It is at least forty years since the wild plum of California (*Prunus subcordata*) was abandoned by experimenters because of its dwarfing effect on free-growing plums. We know nothing which would revoke that decision. If any one has demonstrated otherwise we would be glad to know about it.

For Winter Cabbage.

To the Editor: Will cabbages planted now head in January or February? What variety is planted in the island country?—Reader.

It is perfectly practicable to get cabbage headed by February and March, providing you are in a place where the soil and air are not too full of cold water in December and January. Cabbage is hardy against quite sharp frosts (that is sharp, from a California point of view), but continued cold and water-full soil does not favor growth even though the plants may not be killed. On light soils which rid themselves of surplus water readily or in places where rainfall is not enough to fill the soil, winter cabbage comes all right to cut in February and onward, from plants started now in the seed bed and planted out in October—if the soil is deeply wet by rainfall or irrigation. This is the case on sandy hillsides near the coast in the central part of the State and on the mesas of the interior valleys. It is possible more widely in Southern California, where lower lands can be safely used. Even in places not quite right, planting on ridges will help toward early heading, but low lands subject to too much frost and cold water should be employed for late rather than early crops. The Wakefield and Winnigstadt are the best early varieties largely grown.

Pollination of Squashes.

To the Editor: I planted summer squash this spring in deep, rich, black, sandy loam, from which I had just cleared the primeval sage-brush. Though the aspect was sunny, the spring was cold and the plants made little growth for a considerable time, but when they did start to grow, they did so rapidly and luxuriantly. They flowered and bore fruit abundantly, but long before these latter were large enough to use, they turned yellow, shriveled and fell off. Not one reached maturity. Could you tell me the reason?—W. F. C., Battle Mountain, Nev.

It has been known for twenty or thirty years that squashes are likely to fail to come through in the plateau region because of the absence of honey bees, bumble bees, etc., which are needed to carry pollen from the staminate to the pistillate blossoms, both of which grow on the same vine at some distance from each other. This is probably your trouble and the remedy is to introduce bees or pollinate the blossoms by hand.

Oak Defoliators.

To the Editor: On our ranch in Sonoma county, as well as on the adjoining places that are covered with scrub oaks of quite a size, the trees have been eaten almost clean by a worm. I should call it a measuring worm and they are now hanging thickly from the trees on a web, seemingly playing or spinning their web, I cannot tell which. They already had done a great deal of damage on

the young fruit trees, but this ocean of pests must be fought somehow. Can you suggest some way?—A. W. E., San Francisco.

Is it not strange that when the worms were so abundant you did not think of sending us a few so we could see what insect you have to deal with? It is not quite clear to our understanding, for those caterpillars which make tents are not measuring worms and those which do "measure" as they walk do not make tents. But whichever they are, it is probably not practicable for you to attempt to kill caterpillars all over the wild lands in your region because of the cost. If you wish to save the foliage of the oaks you should spray them as soon as the first worms appear in the spring with arsenate of lead, 2 lbs. to 50 gallons of water. But this would also be impracticable on wild lands because of the cost. These pests succeeded yet. You will have to protect your fruit trees by spring spraying with lead arsenate and trust to nature to look after her own interests on the wild lands.

Scale on Japanese Fern.

To the Editor: I am enclosing a piece of my Japanese maiden hair fern, which is dying. I should like to know if the condition on specimen would be likely to account for its dying, also the cause and treatment.—M. F. D., Conejo.

Your fern is badly infested with "soft orange scale." Cut off all the top growth and clean the stubs carefully with a brush and soap suds. Repot in fresh sand and leaf mold mixture and keep moist but not wet. As new fronds start, water more freely but not too much.

The Bean Thrips.

To the Editor: I send leaves showing how some of my bean vines are affected. What would be the proper thing to do to eradicate the rust, or fungus growth, or whatever disease it may be? R. A. B., Middletown.

It is the work of the bean thrips: an insect very minute and apt to be very abundant. It should be fought, as soon as the whitening of the leaves is first seen, with an oil emulsion or miscible oil spray to which, when properly diluted, tobacco extract is added at the rate of one part of the extract to 2000 parts of the spray. The nozzle has to be poked around to reach all parts of the foliage.

A Joyful Cactus-Grower.

To the Editor: Will you give some recipes for making up the fruit of the spineless cactus? I have a plant of Burbank's spineless cactus that I bought in July, 1914, and it is a wonder. I put it in the ground July 22, 1914, and today it has 55 slabs and 155 fruits, nearly ripe. Is this just an average plant? Will it be right to use the slabs that are now fruiting, to set out, as soon as the fruit is gathered, or should I use this year's slabs? One of the slabs has fifteen fruits upon it.—E. J. F., Goshen.

Cactus fruit has not yet reached the recipe stage in our consciousness. We have been content with it fresh as a breakfast food. If other readers have gone farther into the region of puddings, pies, etc., we should like to have their experience. Your plant is no doubt a good one. It beats any we have but may not make the record—and yet we should expect that from the land of Goshen. You can root any of the pads but do not treat them too well. Let the cut surfaces dry and harden before planting and do not use much water until rooted.

California Weather Record.

The following rainfall and temperature record is furnished the PACIFIC RURAL PRESS by the United States Department of Agriculture Weather Bureau, at San Francisco, for the week ending at 5 p. m., September 12, 1916.

STATIONS	Past Week	Rainfall Data		Temperature	
		Seasonal To Date	Normal To Date	Max'm	Min'm
Eureka02	1.73	.49	74	46

Citrus Precooling Saves Money.

Precooling citrus fruit saves money and puts the fruit on Eastern markets in the best condition. Many new plants are being installed this year.

(Written for Pacific Rural Press.)

Precooling means cooling the fruit down to the neighborhood of 35 degrees, before loading it onto cars which are also precooled and pre-iced. About six tons of ice or its equivalent in refrigeration is required on the average to cool the fruit from 80 degrees. About 6½ tons are required for the initial icing. Then the railroads charge \$7.50 per such car in addition to freight, for something which is still to be defined by the courts. They tried to charge \$30 for this something, but through the Citrus Protective League and the Interstate Commerce Commission, they were prevented from doing so.

Not all has run smoothly in this practice of precooling fruit. Several systems have been tried, and usually with fair success, though often at greater expense. Sometimes the fruit has been frozen in cooling, or the inside ones of a box have been left warm by cooling the outside ones too rapidly. Pre-cooled cars must go direct to their destinations, for, though the ice bunkers are usually part full on arrival at New York, they would not keep the fruit cool much longer.

Advantages.—The advantages are numerous. Fruit is very likely to arrive in better condition than when refrigerated as usual. This is because warm fruit loaded onto the car and shipped promptly still must travel three or four days over hot deserts before it is cooled to a temperature which checks development of mold. This is most important in that large number of cases where fruit has been scratched or bruised in handling. The pre-cooling rooms are capital places to store fruit when shipment is unexpectedly delayed for lack of cars, bad markets, or weather.

Much ventilation of pre-cooled fruit is not desired, so the boxes are packed closer and higher, getting 64 to 68 more boxes per car, at the same reduced cost for precooling and pre-icing. Railroads welcome this additional couple of tons fruit in each car as it increases that car's earnings over \$40 per trip on freight and requires fewer cars to move the crop.

First Pre-cooler.—The first man in the State to have courage and capital to test out the possibilities of commercially pre-cooling oranges is J. S. Edwards of the Gold Buckle Association, East Highlands.

Temperatures En Route.—His courage was based on investigations made by the U. S. Department of Agriculture on oranges pre-cooled in Los Angeles. G. Harold Powell, who had charge of these investigations, is author of a bulletin from which the following figures are taken on two cars shipped in the same train, one pre-cooled and pre-iced at San Bernardino, the other shipped under regular refrigeration. The outside air was always warmer than the pre-cooled fruit until the 9th day in Ohio, when it fell below during the following night. It was 58 degrees outside at the start on Mar. 11. The fruit was 42 degrees. Temperatures were read several times

per day. Temperatures outside the car rose to 70 degrees on Mar. 11, then on the following days to 79, 76, 75, 90, 85, 87, 80, 68, and to 64 on the 20th. The fruit stayed below 45 degrees until Mar. 15 when it rose gradually to 55 degrees on the 18th and shaded slightly downward about 2 degrees on account of cold nights before arrival at Jersey City Mar. 20. About 700 pounds of ice remained in the bunkers. The other car started with fruit at 63 degrees, being iced and re-iced several times in transit. The fruit cooled gradually to 50 degrees on the 15th, rose a degree, then down to 50 degrees on the 18th and down 3 degrees by early morning of the 21st. The four days before it cooled to 50 degrees gave molds a fine chance to get a strong foothold on any fruit that may have been bruised and infected.

Mr. Powell reports that "pre-cooled fruit that is reasonably sound is not more likely to decay after arrival in market than equally sound ventilated fruit. Unsound fruit having decay retarded during shipment either by pre-cooling or icing, decays badly when exposed to the warm atmosphere."

The Gold Buckle pre-cooler and ice factory was established in 1909 in the packing house. It has been in continuous use ever since, to pre-cool practically all fruit shipped to the East after February. It has a capacity of 12 cars per day.

In its elements it consists of the following equipment as shown by F. E. George, in charge of the plant: A steam engine compresses anhydrous ammonia gas to 300 pounds pressure. This is run to a condenser outside the building. There it runs through pipes over which water is running to cool it off. Then it is run through expansion valves into pipe coils above the room in which fruit has been stacked with spaces between boxes ready to be cooled. The compressed gas already cooled, expanding into a much greater space, becomes much colder.

There are six of these pre-cooling rooms, each holding four carloads. The fruit is left in them about 48 hours if it was very warm when packed. It must cool slowly and uniformly to the center of each box. If weather is hot East, it must cool to 35 degrees; otherwise it is not so particular. Ice is made with the same ammonia, to ice the cars and to sell.

Pomona Exchange Has Two Pre-coolers.—The Pomona Fruit Growers' Exchange, H. E. Walcott manager, has two pre-cooling plants, one of them almost the oldest in the State. Refrigeration for one of them is furnished by a nearby ice plant; the other has its own compressors. Their combined storage capacity is 95 cars. They allow more time for cooling than the Gold Buckle people—3½ days if the fruit is 65 to 70 degrees, according to Mr. Walcott, and 3 days if 60 degrees, aiming to cool all fruit to 36 degrees, as their markets are practically all east of the Missouri. Fruit is not pre-cooled for Pacific States markets ex-

cept in particularly warm spells.

The cost of pre-cooling, labor, interest, depreciation and all overhead expense is a little over two cents per box. Ice bought for pre-icing the cars costs \$20 per car for about 6½ tons. Mr. Walcott says that a third of the ice remains on arrival at market.

Here the ammonia coils are in a box 12x52 feet through which a multivane circular fan drives 20,000 cubic feet of air per minute. The air is led to the pre-cooler rooms where it comes up through a false floor between the stacks of boxes. The air ducts are made 18x36 inches, three times larger in the new house

Mermaid Spray Powder

FOR CITRUS
AND
DECIDUOUS
FRUIT TREES

ANALYSIS:—Curd Soap, 50%;
Bicarbonate of Soda, 0.5%;
Carbonate Soda, 37.5%;
Balance Moisture.

FOR ALL ORCHARD PESTS.

SOAP SPRAY—An effective soap spray used in the proportion of one pound of powder to six or eight gallons of water with 200-pound pressure. Not harmful to trees or fruit if properly used.

ERADICATES SCALE.

MERMAID SPRAY POWDER will kill this form of pest when applied conscientiously with the above proportions at the right time. You will also note its effectiveness towards reducing red spider while spraying for scale.

COST—A cheaper and purer soap powder that is prepared with accuracy. Not the cheapest—but the powder that does the work.

UNIFORMITY—Guaranteed to be at all times uniform and without lumps and to dissolve with absolutely no waste, thus saving time and money by not having your spray machine stopped to clean out impurities.

IT WILL PAY YOU—to investigate Mermaid Spray Powder, and to use it, no matter how large or small your orchard.

WRITE US TODAY

We will cheerfully give reference from Professional Sprayers and Growers throughout Southern California who have tried all other Powders and have found **MERMAID SPRAY POWDER** without an equal.

MICA AXLE GREASE

than in the old, on account of friction of the air reducing efficiency. The fan suction draws the same cool air back to blow it again over the ammonia pipes and among the fruit.

The pre-cooler rooms are well insulated. Concrete floors are covered with three coats of hot asphalt, then 2x4s edgewise and more asphalt, then tongue-and-grooved flooring, tar paper, flooring and the false floor, 28 inches through. The sides and ceiling are also thoroughly insulated. Shavings are used for this at the

new plant.

The Redlands Fruit Ass'n., N. L. Lelean, Mgr., has a new plant installed this spring with six cars a day capacity, and costing about \$20,000, according to J. S. Phelps, packing house foreman. Their refrigeration is also obtained from a nearby ice plant. Air is fanned over ammonia coils similarly to the Pomona system. Insulation here, according to Mr. Phelps, is severely compressed cork in sheets three inches thick in the outside walls.

Revision of Horticultural Laws.

[Written for Pacific Rural Press.]

The committee appointed by the Visalia Fruit Growers' Convention to take the initiative in a movement for codification and revision of the horticultural laws of California accomplished its preliminary work at a meeting of delegates from fruit growers' associations which convened in Sacramento on September 6. The following delegates and volunteer participants were present:

W. W. Hinsey, Fair Oaks Fruit Co., California Olive Association.
J. J. Brennan, California Fruit Exchange.
C. K. Turner, Co. Horticultural Commissioner, Placer Co.
E. W. Lewis, of W. O. Davies, Florin.
J. W. Jeffrey, State Viticultural Commission.
Geo. A. Lamiman, County Horticultural Commissioner, Shasta Co.
Dudley Moulton, Horticultural Com., San Francisco.
A. W. Tate, Watsonville Apple Distributors, Corralitos Fruit Association.
A. L. Wisker, Colfax Fruit Association of Placer and Nevada counties.
C. F. Collins, State Association of Horticultural Commissioners.
A. J. Sturtevant, California Peach Growers' Association.
Frederick Maskew, State Horticultural Quarantine Service.
O. E. Bremner, State Association Horticultural Commissioners.
Frank H. Buck, Vacaville Fruit Association.
S. A. Lines, Earl Fruit Company.
E. J. Wickson, Geo. P. Weldon and Geo. H. Hecke, Temporary Committee.
F. B. McKevitt, California Fruit Distributors.
C. C. Teague, California Fruit Growers' Exchange.
E. J. Vostler, Secretary of meeting.
Geo. C. Roeding, Fresno.

F. C. Brosius, Acting Secretary State Association of County Horticultural Commissioners.

F. B. McKevitt was appointed permanent chairman of the committee. The temporary committee announced that it had appointed as members of the standing or permanent committee all those who had been delegated to represent fruit associations at the meeting, as follows:

W. W. Hinsey, Fair Oaks; J. J. Brennan, Loomis; E. W. Lewis, Florin; J. W. Jeffrey, Sacramento; A. W. Tate, Watsonville; A. L. Wisker, Grass Valley; C. F. Collins, Visalia; A. J. Sturtevant, Fresno; Frederick Maskew, San Francisco; C. E. Bremner, Santa Rosa; S. A. Lines, Sacramento; F. B. McKevitt, Sacramento; C. C. Teague, Santa Paula; Geo. C. Roeding, Fresno; Geo. H. Hecke, Woodland; Geo. P. Weldon, Sacramento; E. J. Wickson, Berkeley.

The temporary committee announced that it would exercise its right of appointment later to enlarge the committee so as to include representatives of other growing and handling interests.

The standing committee has also entered energetically upon its work, with the purpose of preparing a report for submission to the Napa Fruit Growers' Convention in November next.

STANDARDIZING GRAPE PACKS.

[Written for Pacific Rural Press.]

The present fruit standardization law specifies that "grapes packed for table use shall be of uniform quality and maturity . . . and show a sugar content of not less than 17 per cent Ballings scale, except Emperor which shall show not less than 16 per cent." They must also be practically free from insects and fungus diseases. Fresno county Horticultural Commissioner thinks Malagas should contain 18 per cent sugar. Another much-needed requirement is pointed out by F. B. McKevitt, president of the California Fruit Distributors:

"It is not claimed that the present law is perfect. Other reforms besides those specified in the act are in order,—notably one that will specify the net weight of grapes to be packed in a standardized crate, so that we can get away from the pernicious practice of crowding thirty pounds of delicate fruit into a package designed to hold twenty-five, thus multiplying indefinitely the chance for loss from decay. This is only one—there are others—but we are on the right road. Its legitimate end will be prosperity to the fruit industry of California."

Would you plant your fruit trees in large tubs?

"Without the use of dynamite in tree-planting," says U. S. Bulletin No. 38, "the roots soon meet with the smooth and compacted sides of the hole, through which they have great difficulty in penetrating. The tree is in about the same situation as if it had been planted in a large tub."

But when you plant your trees in holes blasted with

GIANT FARM POWDERS

STUMPING — AGRICULTURAL

the trees will grow faster, develop deeper, stronger roots, and bear earlier. "When dynamite is used," continues the bulletin, "cracks are formed in the soil to distances of five or sometimes six feet on all sides. This makes the very best conditions for the continued growth of the tree. For tree planting dynamite is recommended confidently as the best method of preparing the soil."

In selecting explosives for your orchard work, be careful to get those that will crack, powder and loosen the soil, rather than pack it or throw it in the air. The proper explosives are the Giant Farm Powders. There are two of these—Eureka Stumping Powder and Giant Stumping Powder—both improved forms of dynamite, made especially to meet western agricultural conditions. They are sold by distributors everywhere. Ask your dealer for them.

Legumes and Berries.

[Written for Pacific Rural Press.]

Can a system of crop rotation be evolved that will necessitate the growing of crops only one year after old strawberry vines have been removed before young plants can be set?

Such is the problem that Dr. J. B. Cutter of Santa Cruz county expects to experiment with next year. His first patch of three acres will be removed then after four years of bearing; and he doesn't believe it is profitable to grow berries if the land has to lie idle as long as customary among berry growers.

The strawberry planting on this ranch has been done in units, three acres in the first one four years ago, but two and a half each year since then, because it was found that the average Japanese family can only care for the smaller patch and do all of the work required.

With five such plots of ground Dr. Cutter expects to be able to have three of them producing and an-

other one coming into bearing all of the time, the fifth plot being planted to some leguminous crop, such as beans, vetch, or clover. This crop will be grown purely as a cover crop and plowed under with the idea of replenishing the soil with at least a portion of the nutrients taken out by the berry plants.

To Dr. Cutter's mind it seems unreasonable that a shallow rooted plant like the strawberry when drawing from but a small amount of the soil should so thoroughly deplete the fertility as to make future planting impracticable. Besides the cover cropping he will plow deeply; and these together with the organic matter secured from irrigation water that is pumped from a nearby lake will, he thinks, permit successful replanting.

Berry growers in the vicinity will watch his experimenting with much interest; and if he is successful it will mean much profit to berry grow-

SOFT JELLY.

To the Editor: I read Professor Cruess's articles on jelly-making with much interest. I bought a syrup thermometer and proceeded to make a blackberry, and a plum jelly, following the directions, I believe, quite accurately. I am not a novice in jelly-making in the ordinary way. I tested the French prune, for pectin, and found it answered to the test. The taste suggested enough acid, as the fruit was only just ripe. Nevertheless when the jellies were completed they were both soft, especially the plum, which I am holding for advice as to how to stiffen it. I have read in a number of articles on jelly-making that more than "pint to pint" of sugar was too much and would tend to soften the jelly. Professor Cruess' theory of retaining the natural flavor of the fruit by extra sugar and lower temperature very much appeals to me and I would like to know how he does it. The above two jellies have certainly a wonderful flavor. A sincere admirer of your paper—M. B. D., Walnut Creek.

[Answered by Prof. W. V. Cruess.]

[I should judge that the trouble has been that the pectin solution was not concentrated sufficiently before adding the sugar. In cases where the fruit is somewhat deficient in pectin or in acid or in both of the constituents, if the juice is concentrated to two-thirds or one-half the original volume before adding the sugar, it will sometimes be found to jelly satisfactorily where failure would result otherwise.

I have never tried to make jelly from the French prune, but have had success with some varieties of plums. The theory of adding extra sugar to the fruit juice in making the jelly is that excessive boiling is avoided and in this way less of the flavor is lost in the vapors that boil off from the mixture. If the juice has sufficient pectin and acid, it is perfectly feasible to add one and one-half cups of sugar to one of juice and simply bring the juice to a boil and make a satisfactory jelly. Where only one cup of sugar is used to one of juice, it becomes necessary to concentrate the sugar in the juice down to a ratio of one and a half to one by evaporating off excess moisture. This of course concentrates the acid and the pectin at the same time that if concentrates the sugar; therefore, it is possible very

often to get a jelly where one of sugar to one of juice is used when it is impossible to make a jelly with one and one-half of sugar to one of juice. Therefore, in case of failure with the latter method, it is feasible to concentrate the fruit juice before adding the sugar.]

The New Reo Six 7-passenger Sedan, \$1750

1500-pound Reo "Speed Wagon," \$1000

2-ton Reo Truck (Chassis only, with Driver's Seat and Cab), \$1650

(All Prices are f.o.b. Lansing, Michigan)

IT WOULD BE DIFFICULT to say just what is "the best thing" about Reo automobiles and Reo motor trucks.

ONE WOULD SAY "the service that goes with every Reo." Another would say "uniform excellence" is "the best thing" about Reos.

BUT WE WOULD SAY without a second's hesitation that one of the best things is the fact that every Reo model is, long has been, and long will be, standard.

FOR IT DOESN'T MATTER when you buy a Reo—in season or out—this year, last year or next year—you have a car that is standard and the depreciation of which is less than that of any other automobile of similar price or passenger capacity.

YOU'D SAY REO QUALITY was probably the "best thing" about Reos—and of course, there's no gainsaying that.

REO QUALITY at Reo prices is universally recognized as "The Gold Standard of Values."

THAT IS THE BASIS of Reo prosperity, Reo demand and Reo reputation of course.

BUT OTHERS MAKE good cars—in spots. By fits and starts as it were. This year a good model; last year, one they are not so proud of; and next year—who knows?—

THERE'S SO LITTLE consistency in the past performances of most of them, none can predict the future with any degree of accuracy.

BUT REOS RUN TRUE TO FORM always. If it's a Reo then it's a good car—no matter what year it was made.

IF IT'S A REO there's always a fixed value for it in the new, or in the "used car" market.

IS IT A NEW REO—it will command a premium. "You were lucky to get a Reo," is an expression a new owner hears frequently.

FOR EVERYBODY KNOWS that the demand for Reos is always greater than the factory output—always has been.

IS IT A 1911 MODEL—any dealer will tell you its present value—and they won't differ five per cent in their estimates.

THAT'S THE REMARKABLE difference between Reos and other cars—with only one exception. And that isn't a competitor of Reo.

CONSIDER THIS most carefully in your selection of a car—this fact, that every Reo model is standard from season to season.

IT IS A STAPLE, not a novelty, you buy when you buy a Reo.

AND IF YOU DO have to wait a few days for a Reo, whereas, you can get other makes right off the floor—remember there's a reason, and that reason is the best possible reason why you should select a Reo for yours.

IT MEANS MONEY in pocket for you in years to come—as well as satisfaction from the day you do get your Reo.

ANTELOPE VALLEY PUMPING.

To the Editor: I see an item in your issue of Sept. 2 about pumping plants in Antelope Valley, Los Angeles county. What depth of a well is required to get sufficient water for irrigation and how high would you have to lift the water, also character of the soil?—N. P. P., Orland.

[Antelope valley is surrounded by hills and mountains, being longest from east to west and 20 miles broad between Rosamond and Palmdale. It slopes gradually from the hills to a broad flat trough which runs northeast through the valley from west of Lancaster.

Artesian water flows nearly if not quite the year around in wells along the trough, and well borers say there is a lake of water under certain portions of the valley. The farther you go from the trough, the deeper you will have to go for water.

Certain sections of the valley, principally in and along the trough, are badly impregnated with alkali. Most of the Valley soil is quite sandy, but the farther you get from the railroad in many directions, the more enthusiastic you become, for alfalfa, grain, fruit, and livestock are changing the appearance of the landscape where alkali does not prevent and where water is available.

T. J. True, a nurseryman who lives south of Lancaster, struck first water at 120 feet and it rose to the 100-foot level in a 6½-inch well which would supply 15 to 20 inches of water if the pump were big enough. Mr. True thinks that eventually 600,000 acres of the Valley will be irrigated.

D. H. Graham, six or eight miles west of Lancaster, has a well 16 inches in diameter 150 feet down, then 10 inches to the 541-foot depth. This is on the rise above and south of the head of the trough. It furnishes 30 inches of water. On his level land, which produces fine alfalfa nearer the trough, water comes 23 feet from the surface but is pumped down to 60 feet.

W. N. Umsted lives four or five miles east of Lancaster, which is eight miles north of Palmdale. This place is perhaps four or five miles southeast from the low level of the trough. The land here slopes 25 to 30 feet per mile. It is steeper nearer the hills. Mr. Umsted has a well drilled 230 feet deep but sanded up, so a year ago it was only 144 feet. Water comes to 27 feet from the surface in summer. A neighbor two miles west of him had a well 500 feet deep from which the water flows just over the casing at the top of the ground.]

CAUTIONS DEEP TRACTOR PLOWING.

[Written for Pacific Rural Press.]

"A farmer usually wants to know first how deep and wide a tractor will plow," says Prof. F. L. Peterson, formerly of University Farm but now with a commercial company. "We cannot recommend deeper plowing indiscriminately. Most any tractor can run right along and tear up ground that has not seen the light

for thousands of years.

Most of the bacteria which make over nitrogen fertilizers and soil elements into soluble plant foods, must have air. Because air has been unable to circulate in these lower soil strata, the latter do not contain them, especially in heavy soils.

"When a tractor user plows so deep as to turn up a large amount of such sterile soil, he gets poor crops the first year because the soil is dead.

"I had typhoid fever once. The doctor barely touched a platinum point in bacteria from my sickened body, then rinsed it off five times in sterile water, then rubbed it ever so slightly on bouillon culture media. Under the microscope I could count 10 bacteria. In 40 minutes these had multiplied so there was no possibility of counting them one by one. But the soil bacteria we want do not multiply so rapidly. The progeny of one may be only 16 or 20 at the end of a season. So it takes time to give life to the sterile subsoil turned up by a tractor.

A tractor-drawn subsoiler breaks up the subsoil so it may store water and gradually become infected with bacteria and filled with plant roots. Such a subsoiler will not interfere with plant growth in the surface soil—it will have a most beneficial effect.

"But if a subsoiler is unavailable, we recommend gradually deeper plowing each season, perhaps only one-half inch deeper in heavy soils, and an inch or more deeper each season in lighter soils.

"Since the Soil Survey of Sacramento Valley made by the U. S. Government and the University of California shows 163 different soil types in that valley, it is hard to lay down a definite rule for deeper plowing."

COMPRESSED-AIR WATER SUPPLY FOR FARM USE.

[Written for Pacific Rural Press.]

A compressed air water system has supplied four families and their gardens for six years and the only repairs have been leather packing. Water is 165 feet below the surface according to J. D. Williams of Santa

Clara county, on whose ranch the outfit is located.

A two h.p. Western Electric motor runs a small Luitweiler pump which forces water into a Kewanee Water Supply tank of 500 or 600 gallons capacity. The pump cog wheels are connected to a small air

compressor which gives 65 pounds pressure in the tank when it is full. This is not in gear very much, since not much air escapes. Under full pressure, the water from faucets is mixed with air, but Mr. Williams thinks this is desirable. When water is drawn out very fast, of course

For Water Deep Under The Ground

Jackson Deep Well Turbine Pumps give continuous and efficient service. They do not get out of order as they have no valves or plunger rods. Very little care or attention needed as they are oiled from the surface. Are much lower in cost than other types of deep well pumps when the expense of dug pits, cribbing and timbering is reckoned. They raise water from the very bottom of the well, thus eliminating heavy vacuums and delivering all the water the well yields. They develop slow wells and increase their flow.

Like all Jackson Made Pumps These Deep Well Turbine Pumps Are the Very Best Pumps Made for the Purpose—They are Dividend Earners, Not Expense Makers

Whatever your water problems may be our Expert Pumping Engineers will help you out free of charge—write

The New Portable—A Real One-Man Stump Puller

Proven a most economical device for clearing stump land. Pulls stumps faster, cheaper and with less work. Your fifteen-year-old boy can drive it around, load and unload it alone. The

Hercules Triple Power Portable Stump Puller

Comes equipped complete, ready for work. The new portable is the greatest development in stump pullers of today. One man handles the job alone, no extra help needed. Think of the tremendous saving of two extra men at \$2.50 per day. Hercules Beats Hand-Power Machine. In Minnesota State Experimental Farm test the Hercules pulled more stumps than a hand-power machine and pulled the stumps at 61% less cost. Think of it, 61% cheaper for you to operate the Hercules. The Hercules, at another State Experimental Farm test, pulled stumps at 70% less cost than dynamite. Write me your stump pulling problems today. Tell me just how much land you have to clear. I'll tell you how to get stumps out for the least money. The stump puller that will save you money and do the work faster and safer is the puller you want. A card from you today brings my special low price, the most remarkable stump puller offer ever made—all facts and proof, with full particulars also information regarding Hercules Hand-Power Machine with 120,000 lbs. pull. My book contains a fund of practical, useful information. Write for it today. B. A. Fuller, Pres. HERCULES MFG. CO., 5125th St., Centerville, Ia.

the pressure is lowered. It was 20 pounds when we saw it and the pump was busy. An automatic stop-and-start mechanism sets the motor going when water is out and pressure low; and stops it when enough water has been pumped to compress the air to 65 pounds. Mr. Williams says this would force water 100 feet high.

A Kewanee head is all right where it is only 50 feet to water, but a Luitweiler head seems most desirable where it is so far down as on this ranch.

Another motor, a 5 h.p. General Electric, is connected to a shaft in the pump house, to run four different emery wheels.
60 days per year.

SHOULD HE BUY A TRACTOR?

Paul Jean of Sacramento county has ten acres of Tokays in which two horses, not especially high-priced, do the first plowing in six days, harrow both ways in 1½ days, then after about two weeks plow the other way and work it down. Just a little other work throughout the year totals not over an average

of 60 days out of the 365. Even the hauling of packed grapes to shipping point is done with a small automobile.

On Monday, Sept. 4, Mr. Jean came to the State Fair Tractor Demonstration to see if he could find a machine which could do the work of his two horses, not cost much more than two fair animals, and eat only

FIELD CROPS.

The Fallon, Nev., cantaloupe crop promises to be excellent.

Fully 6000 people attended the Melon Day Festival at Turlock Sept. 6th.

There will be a bumper crop of Lima beans in Huntington Beach district this year.

Germany will permit no exportation of sugar beet seed until late this fall, after her own demands have been supplied.

Last week the California Lima Bean Growers' Association of Oxnard boosted the price of lima beans from \$5 per cwt. to \$5.42½.

The total of Turlock melon shipments for the season up to the close of last week was 2,496 cars of cantaloupes and 620 cars of watermelons.

Hop-picking began in Santa Rosa Sept. 2. Thousands of people are at work. The crop is excellent, though prices are low owing to the lack of adequate shipping.

El Dorado county has the distinction of reporting the largest yield of white potatoes from any county in the United States. This yield amounted to 790 bushels from a previously selected fertilized acre in a potato field.

A melon weighing 52½ pounds, 2 feet 9 inches long, 2 feet 8 inches in circumference around the middle, and 5 feet 7 inches in circumference lengthwise, was grown on the T. F. Burrows ranch on the Oakland colony near Tulare.

According to the monthly crop report of the U. S. Department of Agriculture, the third largest yield of barley in any county in the United States is in San Luis Obispo, Calif., which reports 115 bushels per acre from a field of 60 acres.

The final efforts of the Beet Growers' Committee at Fallon, Nev., have only been able to increase the original 1,884 acres signed up to 2,212. It is probable that the required 2,500 acres asked for will be planted. The management will not abate its demand for 30,000 tons.

Charles E. Virden, general manager of the California Fruit Distributors, has been elected general manager of the newly organized Pacific Rice Growers' Association, and will handle the business of the rice men through the offices of the California Fruit Distributors.

E. H. Hancock, field man for the State Labor Commission, has been detailed to go to El Centro and establish a branch office of the State Bureau to assist the cotton growers in getting pickers for the field. One dollar a hundred pounds has been decided upon as the price basis for picking.

Eugene H. Grubb of Carbondale, Colo., a farmer, but for years conducting researches in the potato industry at the instance of the Dept. of Agriculture from a cultural standpoint, has been employed by the Southern Pacific Co. to look over the potato industry along its lines in California and Nevada.

DECIDUOUS FRUITS.

An increase in prices to the trade, ranging from a quarter cent up, was announced last week at the office of the California Fruit Growers.

These are busy days in the Colusa prune orchards. The price is higher than for many years. The grape and almond growers are busy also.

It is claimed that a Chinese pear tree absolutely resistant to pear blight has been propagated at the Plant Introduction Garden at Chico.

A new disease has developed in the peach orchards near Ceres. The disease manifests itself with black spots in the peaches, which causes decay.

Green fruit is moving out of the

San Joaquin valley at the rate of 50 and 60 cars a day, and good prices are being received on the Eastern markets.

Fruit growers are interesting themselves in some new stock from foreign countries upon which is almost if not entirely resistant to the blight.

The reasons for the high price of fruits and vegetables at Chicago, many of which are retailing for twice what they brought last year,

THE KILLEFER MANUFACTURING CO.

2209-21 SANTA FE AVE.

LOS ANGELES, CAL.

It is reported that all the Peach Tree farmers on the Miller & Lux property, in the vicinity of San Lucas, will have to vacate this fall, as cattle are to occupy the whole ranch.

A new variety of red apple has been grown in the orchard of Paige & Son at Corralitos. It is known as the Odrenco, is blood red in color, and has the shape of the winesap, and has a delicious odor.

The latest industry for California began operations at Middle River this week, it is said, in the manufacture of potato flour and potato starch from culled potatoes from the lands of the Sacramento district.

Smith Valley, Nev., has a successful berry grower in M. F. Hovey. Mr. Hovey has had wonderful success in growing strawberries, raspberries, currants and gooseberries, and disposes of all he can raise to the farmers in the valley.

CITRUS, OLIVES, SEMI-TROPICAL

There is a strong demand throughout the Eastern States for California almonds. The crop is short and prices are high.

Building is begun on the new olive plant at Lindsay. Lindsay has one of the largest acreages to olives in the State.

The annual report of the Victoria Ave. Citrus Ass'n, Riverside, shows an average of \$1.65 per box received for navels, and \$2.20 for Valencias, f. o. b. Riverside.

G. W. Williams, president of the Goleta Walnut Assn., says that last year's crop of nuts is practically all sold, and that this year's nuts will probably be all sold before they are harvested.

The Central Walnut Association, consisting of delegates from each of the various walnut associations of the State, will meet on September 20 to set the price on nuts for the coming season.

Construction on the cannery to be operated by the Northern California Olive Corporation has been started at Palermo, Butte Co. Heretofore the company has sold its olives to the Calif. Fruit Canners' Ass'n.

The two-stab lady-bug, a type of insect inimical to the gray scale that infests citrus trees, is a welcome invader of the citrus orchards roundabout Lemon Cove, Tulare Co. The bug is of a bluish hue, with a red spot on either side.

California's lemon crop this year is to be 92 per cent while the average for the last ten years has been 88 per cent, according to the latest report of the U. S. Department of Agriculture. Oranges are 93 per cent as compared with a ten-year average of 88 per cent.

At the annual meeting of the Central California Citrus Fruit Exchange officers were elected for the year, including Frank Hostetter, president; G. S. Berry, vice-president; A. S. Rider, secretary and manager; G. V. Reed, treasurer; G. S. Berry, delegate to the California Fruit Growers' Exchange.

GRAPES.

A big raisin-stemming machine for the Live Oak Association arrived last week.

Tokay grapes are being shipped out of Lodi at the rate of 40 to 45 cars a day. The fruit is in prime condition, and fancy prices are expected.

The Ceres growers of Malagas and Tokays are busy picking and packing their vintage. From 50 to 200 boxes of California figs are shipped each day with the grapes.

The viticultural interests of the State are jubilant over the passage of the new revenue bill, which modifies the emergency wine tax that has borne so heavily on the grape industry the past year. The bill provides for the rebate of 45 of the 55 cents per gallon emergency tax paid on grape brandy used in the fortification of sweet wines, this being the difference between the old tax of 55 cents and the new one of 10 cents, and means a saving to brandy makers of the State of \$1,175,978.79.

Grape-picking around Fresno starts this week on a record crop. Thompson Seedless crop will be about the same as last year, while the muscats will be a little heavier.

Contracts for picking raisin grapes on the contract system as approved by the I. W. W.s, has begun in the San Joaquin valley. The price is 3½ cents a tray, which is slightly above the average.

Prof. W. V. Cruess of the viticultural department of the University of California, has been in Yuba county recently studying the methods of drying grapes by the big dryers in the county.

Wine grapes from the Livingston vineyards have been practically all

sold for this season. The prices paid averaged \$15 per ton f. o. b. Livingston. These grapes are mostly of the Zinfandel variety.

It is reported that some choice hill grapes in the neighborhood of Healdsburg have sold as high as \$25 a ton. The Calif. Wine Assn. has announced a price of \$20 a ton for good grapes with high sugar content.

Fruit packing at Dinuba has become general. About 20 per cent of the Malaga crop is still on the vines. Emperor shipments will go forward the latter part of this month. The Thompson Seedless crop is exceptionally good this year, many of the vines yielding three or four trays.

MISCELLANEOUS.

Dr. A. J. Cook, State Horticultural Commissioner, who has been ill in the East some time, is reported to be improving.

The first annual Kern Co. agricultural fair will be held October 24-28. Agricultural exhibits are to be featured, and an auto race is programmed.

The International Harvester Company and the Best Manufacturing Company are among the manufacturers of tractors which will have machines on exhibit at the annual meeting of the Humboldt County Farm Bureau to be held in October. Other manufacturers are arranging to ship their tractors to that county.

26 Extra
Features

Mitchell
MID-YEAR
MODEL

73 New
Conceptions

A Car That Costs Too Much In an Ordinary Automobile Plant

When you see the Mid-Year Mitchell you will wonder how we give so much at such a modest price.

You will see a car which, inside and outside, seems built without regard to cost. You will see 26 extra features—costly things which other cars omit. Extras which cost us \$2,000,000 on this season's output alone.

You will ask how we afford it, when other like-class cars do not. And that's what we want to tell you.

John W. Bate Saves 50%

John W. Bate, the great efficiency expert, has built a new plant for the Mitchell. He has equipped it with 2092 up-to-date machines.

In this model plant, covering 45 acres, he has cut our factory costs in two. He builds here, under his efficiency methods, 98 per cent of this car. Even the bodies are built here.

In an ordinary plant a car like this would cost too much to sell at rivals' prices. In this plant all these Mitchell extras are paid for by factory savings.

The Hidden Extras

The Mitchell embodies 26 extra features which other cars omit. Our latest model—the Mid-Year Mitchell—brings out 73 new conceptions.

You can see these things. And they make the Mitchell the most complete car, the most up-to-date car you'll find.

But the greatest things Mr. Bate has accomplished are hidden in the chassis—the things that mean most to you.

Here is a car built almost without castings. There are 440 parts which are drop-forged or steel-stamped.

Here is a car where the margins of safety are never less than 50 per cent. Every part is stronger than it need be. It is built for a lifetime car.

Six of these Bate-built cars have averaged 164,372 miles each—over 30 years of ordinary service. One has run 218,734 miles without yet wearing out.

Mr. Bate's 17th Model

Our latest design—the Mid-Year Mitchell—is Mr. Bate's 17th model. It shows the results of 700 improvements which Mr. Bate has made in this car.

You will see here 73 new conceptions, new ideas and touches. Our experts examined 257 models, European and American, before this was completed.

You will find a power tire pump on it. You will find Bate cantilever springs, not one of which ever has broken. There's a light in the tonneau, a locked compartment, an engine primer at the driver's hand. There is a ball-bearing steering gear for ease of driving. There is a new type of control.

When a man buys a car for a lifetime, this is the car he wants. The value it gives will amaze you.

Ask your nearest Mitchell dealer to show you this new model. If you don't know his name write us.

Fall Planted Onions.

[Written for Pacific Rural Press by Chas. F. Barnum.]

The experience of a successful Japanese onion grower of the Mesquite Lake region in Imperial Valley is very suggestive.

"I grow only crystal wax onions and plant the seed about October 10. I put my furrows three feet apart and plant two rows about one foot apart on the ridges. The seed I sow with a drill spacing them three inches apart.

"Between March 15 and May 1, I have plenty of green onions which I sell for enough to pay for the seed

and maintenance before they get too old for the green onion market.

"About May 1 I complete the fifth and last irrigation, but cultivate after each irrigation except this last one. I do not cultivate the last time, because I want the weeds to grow and thus shade the onions to avoid sunburning.

"I had this year 20 acres planted and got about 200 fifty-pound crates from each acre. This year I cleared about \$200 per acre but on the average, one can figure about \$150.

POTATO FIELD CRATES.

[Written for Pacific Rural Press.]

Crates are found far superior to sacks into which to pick potatoes in the field. Sacks cost 7½ to 9 cents and are too valuable to waste by allowing them to become wet and soiled in the field. Clean sacks are much more attractive to buyers. Potatoes picked from damp ground hold the moisture and spoil quicker in sacks than if dried first. But drying in the field often means sunburn. Rough handling of the starchy potatoes of the foothills causes them to crack.

Crates made 18x36x9 inches, from light wood strips, holding 110 pounds of potatoes, were found by E. H. Phreaner of Eldorado county to be ideal for handling them between field and grader. It is handy to pick into them, they are stacked up in trucks and in grading shed, as high as convenient, without any pressure and bruising of the potatoes, and good circulation dries them off in the shade.

VETCH-AND-GRAIN HAY.

To the Editor: I have raw desert land, never before cropped, deficient in humus. I wish to plant wheat or barley this fall, to cut green for hay. Will my hay yield be increased if I plant a small amount of vetch (inoculated) with the grain? I refer particularly to any stimulating effect the legume may have upon the grain by its proximity. If an increase is possible, in what proportion should I mix the seed (grain and vetch)?—W. F. A. Mc., Thermal.

[Answered by W. M. Mertz, Riverside Experiment Station.]

[The practice of mixing common vetch with barley or wheat for hay is seldom followed in this state. However, it is not an uncommon practice to use hairy vetch with barley or rye to make the resulting hay higher in quality, particularly in increasing its protein content.

The association of vetch with the cereal crops has been shown by some investigators to make for the better development of the cereal, when proper amounts of the two are grown with each other. Under irrigation, I can see no reason why the common vetch should not do well if inoculated, and undoubtedly the hay would be of greater value.

During a dry season or where the soil tends to be very low in nitrogen, the proportions of seed would vary. On a soil where the hay crop would normally be fairly good, the danger lies in having too much barley seed in proportion to the vetch. In a soil very poor in nitrogen, there is danger of getting too much vetch for the barley, the vetch being more or less independent of the soil nitre-

gen. Where there is too large a proportion of vetch, it is hard to cut and handle for hay. As a figure to work from, I should recommend in general the sowing of 30 pounds of vetch to 50 pounds of barley.]

[Note.—We have seen legumes growing with oats where the latter looked like young corn stalks and certain visitors would not be convinced that they were oats until the heads could be pulled out.]

CORROSIVE SUBLIMATE DOES NOT HINDER POTATO GERMINATION.

[Written for Pacific Rural Press.]

That there is no danger of killing seed potatoes by leaving them in corrosive sublimate solution too long seems proved by E. D. McSweeney of Los Angeles county.

He dips the seed for scab. Sometimes potatoes slip through holes in the sacks while dipping. Mr. McSweeney says that after such potatoes had soaked a full week, he planted them and they grew as well as the rest. He uses one pint of corrosive sublimate per 30 gallons water.

MORNING GLORY.

To the Editor: What is the best method of eradicating wild morning glory from alfalfa? It does not appear outside of a space about 20x20 feet as yet, but just discovered it and suppose it is spreading rapidly.—C. W. C., Lindsay.

[Answered by Wheeler, Reynolds & Stauffer.]

[We consider that Nonpareil is the best chemical for destroying wild morning glory.

Nonpareil is a liquid which when applied to the root of the morning glory, kills it in a very few days. Nonpareil does not injure the soil in any way. It also kills all insects which infest the ground.]

SUNFLOWER SEEDING.

To the Editor: How much sunflower seed will it take to sow one acre, and what would the normal yield be on same?—S. C. S., Tres Pinos.

[Answered by E. Powers, Manteca.]

It will take four pounds of sunflower seed to one acre, if sown in rows 36 inches apart, 18 inches apart in the row. The normal yield would be 15 sacks per acre, weighing about 75 pounds the sack.

Blackbirds have become such a pest in the rice fields near Marysville that farmers thereabout are shooting all they can hit. One farmer says blackbirds are costing him \$100 a day. Wild ducks no longer migrate north, but make their home during the hatching season in the rice fields. Wild ducks and blackbirds, together with jack rabbits and cottontails, make serious inroads on the profits of rice grow-

State Fair Livestock Show.

[Written for Pacific Rural Press.]

Two things stand out prominently in the 1916 State Fair visitor's memory, viz., the weather which was delightful, and the livestock show which was marvelous for its quantity, quality and diversity of exhibits. There have been times in the past when excuses would have been more appropriate than praise for the livestock industry as presented at Sacramento, but that time has passed, as was evidenced by the attendance, which was larger than previous fairs despite the destruction of the horticultural exhibits by fire earlier in the week. Thus we believe that the livestock show attracted more than premium seeking exhibitors; it embraced seekers after livestock knowledge as well, and those seekers were farmers as a rule.

Swine.—Hogs outnumbered all other kinds of livestock with a total of 795 head divided as follows: Berkshires, 239; Durocs, 206; Poland Chinas, 193; Hampshires, 59; Chester Whites, 57; Yorkshires, 33 and Mulefoots 7.

The outstanding feature of the entire swine show was the finish that practically every animal carried. It was clearly apparent that the old difference of opinion as to the flesh a hog should carry in the show ring has been settled, for a more uniform finished lot of hogs was never assembled in any previous California show. True enough some were doubtless ripened up too quickly, but experience in building bone with fat will overcome that.

Dairy Cattle.—In numbers dairy cattle beat previous records, the total of all breeds being 400 head, of which Jerseys contributed 124, Holsteins 118; Guernseys, 78; Ayrshires, 41; Milking Shorthorns, 15 and Dutch Belted 24.

In this division also has come a distinct improvement of condition in animals shown, good mellow hides and glossy coats being the rule rather than the exception.

The Holstein show was undoubtedly much smaller than the popularity of the bred in the State warrants, but is accountable for by the dangerous ground one treads in showing cows that are being maintained for their milk record qualifications.

The Jersey show was gratifying inasmuch as confidence in the rugged, dairy type Jersey was more firmly than ever impressed on breeders' mind by the consistent manner in which the judge picked out the blue ribbon winners from among the larger type animals. It is a pleasure to record that the judge in this case used a dairyman's measuring rod rather than an antiquated fanciers' score card.

Grand Champion Rambouillet Ewe, Owned by Bullard Co.

The Ayrshire show furnished the first real opportunity of judging the merits of this breed ever presented State Fair visitors in California. Nothing is more pleasing to the eye than the square udders which are characteristic of this breed and which

Grand Champion Percheron Stallion, Owned by M. Bassett.

our breeders seem to know the value of.

Good grooming and a more decided tendency toward definite types was in evidence in practically every Guernsey class, although it was apparent that exhibitors and especially those who have their nose close to the milk bucket are going to be slow in breeding away from the big vigor-

the number of exhibitors. In this respect no State Fair in recent years has equaled the one just passed. Few of the faces which were present as owners this year have been contenders in the past and it is on this basis that the success of the show should be considered, as it argues well for the future.

Sheep.—In the matter of public interest nobody was kept busier an-

swering questions and making sales than the shepherds and flock masters. The show was an improvement over those of recent years inasmuch as there were more sheep shown and of a decidedly higher class in some divisions. We doubt not that sheep husbandry from a showman's standpoint, and that means from a utility standpoint, will benefit greatly by

Grand Champion Guernsey, Owned by Edgemoor Farms.

ous type toward the more refined, and perhaps straighter-backed kind, which seem to find most favor among show-ring judges.

Beef Cattle.—Judged by numbers alone the beef cattle exhibit did not indicate progress, for there were but 50 head of which 43 head were Shorthorns. But a more significant feature than number of cattle was

the exhibition staged this year.

Horses.—For the first time in years California has held a thoroughly praiseworthy horse show without the assistance of out of State importers. True enough there was an unusual lack of gaudy braiding in mane and tail of many of the animals shown, but it was essentially a breeders' and farmers' show.

Champion Pen of Range-Raised Rambouillets, Owned by T. S. Glide.

The most spectacular and probably the best show was staged by the Shire breeders who put up a highly deserving competition for ribbons in practically every class. There were about 35 head entered from the different stables.

The Percherons outnumbered all other breeds as usual with 50 head. All of the livestock awards are given in the following:

HORSES.

Percherons.—Stallions, four years old or over: 1, Ithos, M. Bassett, Hanford; 2, Loiret, N. W. Thompson, Oakland; 3, Kapet, Whitehall Estates, Inc., Tracy. BASSETT'S POLAND CHINAS

Champion Herd at Sacramento

Won 27 Prizes, including Grand Champion Boar, Grand Champion Sow, Champion Boar bred by Exhibitor, Champion Sow bred by Exhibitor, 15 firsts and 5 seconds.

Grand Champion Sow

Miss Beauty, 550364, Grand Champion at P. P. I. E. and at Sacramento.

My herd is large, and I am able to cull closely. The animals sent out as breeding stock are the very tops of a large number. I KNOW that my kind of Poland China is a profitable farmer's hog, for I send carloads of them to the packer every year—uniform in size, high in quality, quickly and economically matured and finished.

Grand Champion Boar

Herd Boar Surprise.

For many years, at widely separated show rings, under many different judges of varying type ideals, my Poland Chinas have been consistent prize winners. They are the kind that seem to have been universally recognized as GOOD HOGS.

BUY THIS KIND; USE COMMON SENSE IN MATING AND FEEDING AND YOU WILL BREED THIS KIND.

Young Stock \$30 and Up

Holstein Breeders'

THIRD ANNUAL

SALE

Hanford, Cal., October 18, '16

100 Head Registered Holsteins

Consignments from reliable and well-established herds. Select type. Choice breeding.

A sale of good, sound, dependable cattle, good enough for any herd. There will be no better opportunity this fall for the beginner to select foundation cattle at conservative prices. They will undoubtedly sell well worth the money. No extreme prices expected.

Good young A. R. O. cows in calf to some of the best 30-pound sires in the State. Many with records of 20 to 26 lbs.

Heifers from high record cows in calf to highly bred sires.

Young bulls with the type and breeding that qualify them to head the best herds.

For information and catalog address,

Choice Holsteins

CONSIGNED FROM

A. W. Morris & Sons' Herd

COWS-HEIFERS-BULLS

In the California Holstein Breeders' Sale at Hanford, Cal., October 18th, and at the big Sacramento Sale, October 26th and 27th, under the auspices of the California Breeders' Sale and Pedigree Co., the quality of our consignments will be unsurpassed by any previous Pacific Coast Sale.

THERE WILL BE—

Choice bred A. R. O. cows in calf to 30-pound sires. Heifers out of A. R. O. cows and 30-pound sires and bred to 30-pound bulls. Young bulls from 30-pound dams and with such yearly record backing as has never before been included in a California sale. A son of Prince Gelsche Walker (the \$12,500 sire) from a 27-pound three-year-old that made 20 lbs. as a junior 2-year-old. A son of King Mead of Riverside from a State record daughter of Prince Gelsche Walker. A son of SEGIS PONTIAC DE KOL BURKE from Dottie Clyde Korndyke, 31.88 lbs., 113 lbs milk in a day, a daughter of Korndyke Queen De Kol's Prince. Two sons of Aralia De Kol Pontiac Segis out of 31 and 32-lb. daughters of De Kol Burke. A son of a 33.50-lb. cow. Two sons of 29-lb. cows. A son of a 27.50-lb. daughter of Riverside Sadie De Kol Burke. A son of a 27.58 lb. 4-year-old daughter of a 33-lb. cow. Others from 25 to 30-lb. dams, all with large yearly records.

The three nearest dams of a number of these have yearly records from 800 to 1100 lbs. butter, and along with this they have an abundance of individuality and breeding.

Further information on request.

Drop"

Raise Your Calves on Blatchford's Calf Meal and Sell the Milk

More calves have been raised on Blatchford's Calf Meal than on all other milk substitutes combined.

100 lbs. makes 100 gallons of milk substitute, costing only one-third as much as milk. Prevents scouring and insures the early maturity of sleek, handsome calves.

It is steam-cooked and no trouble to prepare or use.

Write for Pamphlet "How to Raise Calves Cheaply and Successfully with Little or No Milk." At dealers, or Blatchford Calf Meal Factory, Dept. 117 Waukegan, Ill.

Concentrated—only a few drops required at an application. Price \$1 per bottle at dealers or delivered. W. F. YOUNG, P.D.F., 86 Temple St., Springfield, Mass.

Purebred Registered HOLSTEIN CATTLE

The wonderful vitality which is characteristic of the purebred Holstein-Friesian breed is strikingly shown in the career of Jette's Rose's Aggie's Artis, owned by F. M. Nichols of Lyndonville, Vt. She is nearly twenty years old and in April was carrying her sixteenth calf. For fifteen gestation periods she totaled 332,500 pounds of milk, which, at 4 cents a quart, would be \$4,920, at a cost for feed for fifteen years amounting to \$1,950. She thus shows a profit of \$2,970, in addition to which must be reckoned \$6,000 worth of fine healthy calves. She has won many ribbons and prizes at fairs and has seven daughters with A. R. O. records. There's big money in the big "Black and White" Holsteins.

Send for FREE Illustrated Descriptive Booklets. The Holstein-Friesian Association of America. F. L. Houghton, Sec'y. Box 230, Brattleboro, Vt.

BLACK LEG

LOSSES SURELY PREVENTED by CUTTER'S BLACKLEG PILLS. Low-priced, fresh, reliable; preferred by western stockmen because they protect where other vaccines fail.

Write for booklet and testimonials. 10-dose pkg. Blackleg Pills, \$1.00. 50-dose pkg. Blackleg Pills, \$4.00. Use any injector, but Cutter's simplest and strongest. The superiority of Cutter products is due to over 15 years of specializing in VACCINES AND SERUMS ONLY. INSIST ON CUTTER'S. If unobtainable, order direct. The Cutter Laboratory, Berkeley, California

ALFALFA MEAL

If you use any alfalfa meal at all, in small amounts or in car lots, write to us and buy direct.

A Rainy Day Job

Just because you can't work outdoors, the day need not be wasted. Use it for the job that keeps glanders, foot-and-mouth, anthrax and other fatal diseases out of your herd. It may be the most profitable day in the year. Disease, once started, may wipe out a lifetime's work.

CARBOLA
The Disinfecting White Paint

is a snow-white mineral paint combined with a germicide 20 times stronger than carbolic acid. It paints and disinfects at one operation, cutting labor cost in half.

Use It Instead of Whitewash

to prevent disease and kill lice, mites, ticks, fly-eggs, etc. Comes in powder form. Put on with brush or sprayer as soon as mixed with cold water. Will not spoil by standing. Order some now and have it handy. Your dealer has it.

10 lbs. (10 gals.) \$1 plus postage. 20 lbs. (20 gals.) \$2 delivered.
50 lbs. (50 gals.) \$4 delivered.

Trial package, enough to cover 250 sq. ft. and booklet, "The Disinfectant That Paints," 25 cents. If you cannot get Carbola locally, send your order and dealer's name to us. We'll ship promptly.

New Duroc Record

103 Head of Registered Durocs 103

Sold to B. F. Graham of Colton, is we believe, the largest sale to one firm ever made in California.

THAT'S NOT ALL.

Since January 20, 1916, we have sold 69 Registered Durocs to other breeders of the State in smaller lots. We are the largest breeders in the State and have plenty more Durocs left for sale just as good. Visit our herds at Holtville and Devore and see the reason for the popularity of these easy-feeding prolific Durocs. Address all correspondence to Devore, San Bernardino Co., Calif.

STENZEL'S HOLSTEINS Champion Butter Fat Producers WON FIRST AND SECOND IN THE FIVE-DAY BUTTER- FAT PRODUCTION CONTEST AT THE STATE FAIR.

Beryl Clothilde Hengerveld.

Beryl Clothilde Hengerveld's
record for five days was:

351.9 lbs. Milk
21.11 " Butter
Test 4.7%

This beat by far all previous
records made on State Fair
Grounds.

Clothilde Pontiac Creamelle, recently at 2 yrs. 1 mo., made an
official 7-day record of 22.52 lbs. butter, 391.7 lbs. milk, test
4.72%, making her **CALIFORNIA CHAMPION TWO-YEAR-
OLD.**

GOOD ENOUGH FOR ANY HERD.

This youngster is half brother
of the California Champion Two-
Year-Old, both being sired by
Dutchland Pietertje Creamelle.
His dam is granddaughter of
Pontiac Korndyke, the world's
greatest Holstein sire, and she
has a record of 28.17 lbs. butter,
456 lbs. milk, test 4.9%. This
bull is perfect in type, 50% white,
and just ready for service.

Aggie Grace Pontiac Creamelle.
Born Apr. 22, 1915.

A few other choice young bulls with butterfat breeding
behind them.

F. STENZEL, Breeder of High Test Holsteins
SAN LORENZO, CALIFORNIA.

BELLA VISTA HERD Hampshire Swine

THE SUPERIOR QUALITY OF THE HAMPSHIRE HOG
is rapidly being recognized. The Hampshire Exhibit at the
State Fair was excellent, and, as usual,
THE BELLA VISTA HERD helped make it a success, winning
23 prizes with 22 entries.

Specially this herd was awarded:

FIRST AND GRAND CHAMPION for best female Hampshire
shown.

CHAMPION BOAR, any age, bred by exhibitor.

CHAMPION SOW, any age, bred by exhibitor.

GOLD MEDAL, 4 swine, get of same boar, Berkeley King.

GOLD MEDAL, 4 swine, get of same sow, Showers.

SPECIAL SILVER TROPHY, awarded by American Hamp-
shire Association for 4 pigs under 6 months, bred and ex-
hibited by a resident of the State of California.

Some specially good gilts for sale, bred to Evans' Bond, the
best bred boar on the Coast; his sire, Sir Messenger Boy; dam,
Nora Duchess.

Some fine young boars for service or weanlings, \$20 up.

Will be at the Live Stock Shows With
Jersey Cattle
and O. I. C. Swine

With our herd will be a number of young Jersey bulls, ready for service, and out of our large high-producing cows, that will be for sale.

Also, young boars of splendid growth and type.

If you need a herd sire, be sure to see this lot at your nearest fair. We are taking them there for your inspection before buying.

If more convenient, visit our ranch or write for prices and pedigrees.

Martin Pradere, a large sheep raiser of Carson Valley, Nevada, has sold his land and sheep to E. A. Settemeyer of Gardnerville.

TEST OR PASTEURIZE?

To the Editor: If one makes application to the proper authorities to have a cow tested under the new milk law which goes into effect Oct. 1, has her tested and she does not stand the test, can her milk then be pasteurized and sold to customers? Tell me whom I must make application to to have a cow tested. —Subscriber, Loomis.

[Milk from tubercular cows may be sold if properly pasteurized, so far as the State law is concerned. But you will have to find out the regulations for pasteurized milk in the municipality where you expect to sell it. Most cities require pasteurization at specified plants. At least one will not allow milk from tubercular cows at all. Apply to State Veterinarian Chas. R. Keane, Sacramento, to have your cows tested; and you will be permitted to sell your milk until his official tester can do the work.]

WHEN TO CUT SORGHUM FOR DAIRY FEED.

To the Editor: I planted broadcast sorghum for cow feed June 24, on moist bottom land. When should this be cut to get best feeding value? W. L. B., Modesto.

[Answered by Prof. F. W. Woll, University Farm, Davis, Cal.]

[The sorghum may be cut any time after bloom, if it is to be fed green or cured for hay, and the nearer this stage of growth, the better to get the best feeding value. If left until toward maturity, a heavier yield of feed materials will be secured from the field, but the green sorghum or hay will be less palatable to stock than when it is cut earlier. If cut for the silo, the sorghum varieties are preferably left until the seed is fully matured. It will make a better quality of silage at this stage than when cut earlier, when the stalks contain considerable amounts of easily fermentable sugars which would make the silage very high in organic acids.]

TWIN HEIFERS BREED.

To the Editor: I would like to say to Jack Mounovan that his advice to A. H. H., Ukiah, to kill twin heifers is poor indeed. I had a pair of twin heifers that were as good or better milkers than others I have raised. One of them was considerably above the average. I sold them both at first calving, one for \$80.00 and the other for \$90.00.

McFarland. S. K. Remington.

The REMCO SILO

Made of Air-Dried Redwood The Standard

Mr. A. L. L. Dairyman,
Everywhere, Calif.

Dear Sir:

What would you give for Green Pasturage the year around? If you had it you'd make a lot more money, wouldn't you?

You can have it or its equivalent, **THROUGH SILAGE**, at less cost in labor and money than through natural pasturage, almost without regard to seasonal conditions and dependent only upon your own efforts.

Corn is not the only crop for silage. Feterita, Milo Maize and Other Sorghums, Barley, Oats, Alfalfa, Vetch and Cowpeas all make good silage.

You do not have to wait until next fall to profit from a silo. Fill it in the spring with fall-sown grain or the first cutting of alfalfa, and insure against such losses as you had this season. Ask us about it.

With the Livestock Men.

[Livestock breeders all over the State are invited to send on postal cards, notes regarding their sales, State and County Fair intentions, new stock, etc.]

DAIRYING.

N. H. Locke Co. shipped a part of their Jersey show herd from the State Fair direct to Fallon, Nevada, where they are entered for prizes at the Nevada State Fair.

J. E. Thorpe of Stockton exhibited some of his butter at Sacramento last week which scored 92½. He also won a silver medal on his exhibit of dairy products.

The California Jersey Cattle Club will hold a meeting at Modesto September 21, during the Stanislaus County Livestock Show and Exhibition. All Jersey men are invited to attend.

The Fresno District Fair will offer \$250 as a first prize, \$150 as second prize and \$100 as third prize for the three best herds of dairy cows exhibited, regardless of breed, each herd to contain 12 head.

Arrangements are being made by the Arcata Chamber of Commerce for an Agricultural Day on September 28 to welcome members of the California Creamery Operators' Association who will hold their annual convention in Humboldt county this year.

The Steybrae Stock Farm of San Mateo county shipped their herd of Ayrshires from Sacramento to Fallon, Nevada, directly after the California State Fair closed. They will make all of the more important shows in this State after returning from Nevada.

The Humboldt County Fair held last week brought out a choice exhibit of dairy cattle and hogs, the former being well represented by Jerseys, Holsteins and Durhams. The stock exhibits and races attracted the largest crowds ever drawn to similar events in the county.

At a meeting of the California Guernsey Cattle Club held at Sacramento last week W. Hidgon of Tulare was elected president, D. O. Brant of Owensmouth, secretary-treasurer, and B. Nixon of Napa, vice-president. It was the sense of the meeting that every member will safeguard the interest of young breeder purchasing foundation animals.

HOGS.

F. V. Gordon of Perris has the largest herd of purebred Hampshires in the State, having recently purchased the herd of Walter Gatton.

The Butte City Ranch is importing a carload of choice Berkshires from the East, purchased for them by L. E. Frost. A portion of them will be offered for sale.

The Western Meat Co. of San Francisco purchased all of the fat barrows shown at the State Fair, paying over nine cents a pound for them in several instances.

W. H. Rough of Arlington, Riverside county, has just purchased the large type Poland China sows Anna Price 11th, dam of his herd boar Superba, and Big Anna Orange. Both of these sows are among the best in the East and will be added to later by other high-class purchases.

At an informal gathering of Duroc breeders held at Sacramento last week it was decided to hold a meeting of Duroc breeders at Modesto during the Stanislaus County Livestock Show and Exposition with the hope of organizing a West Coast Duroc association. The meeting will be called shortly before or after the auction sale of Durocs which the Stanislaus County Duroc Breeders Association will hold.

A. M. Henry reports the following recent sales of Poland China hogs: a 10-month-old gilt to Pecho Ranch and Stock Co., San Luis Obispo, \$75; an 8-month gilt to S. Mastick, Middletown, \$75; a 10-month-old

boar to J. E. Sachreiter, \$50; a 10-month-old boar to Huston and Hanum, Norton, \$40; a six-month-old boar to W. Rushing, Cooperstown, \$35; two 8-month-old gilts to C. Q. Jordan, Colusa, \$40 each; two six-month-old sows to F. W. Shoff, Tehachapi, \$35 each.

SHEEP.

The Bullard Co. will show their flock of Rambouillets on the Arizona and Texas fair circuits.

Bishop Bros. will send a show flock of Shropshires East this year to compete with the best flocks in the United States. They will not make the northwest circuit of fairs as they had previously planned.

California purchasers at the National Wool Growers' ram sale were Ellenwood and Ramsay of Red Bluff who purchased 25 Hampshire rams; Chas. Kimble of Hanford who bought a Rambouillet ram; Bullard Co. of Woodland, who bought a selected lot of Rambouillet ewes, and G. B. Wilcox of Red Bluff who bought a fine Rambouillet ram to breed on a choice band of Merino ewes.

BEEF CATTLE.

The Gibson Estate will show their herd of Shorthorns on the northwest fair circuit during the next couple of months.

F. L. Hall of Perris states that he will enlarge his herd of registered Shorthorns in the very near future as the local demand is more than he can supply at the present time.

The Barco Ranch at Hollister will add to their herd of registered Shorthorn cattle shortly by the purchase of two carloads of cattle in the East. They have 80 breeding cows at the present time.

PIGS HAVE RED NOSES.

To the Editor: My pigs' noses and feet turn red and then scab. Legs get so sore they can hardly walk. Makes them runty and some die.—W. S., Mulberry.

[This is necrobacillosis. Wash the affected parts twice daily with a 2 per cent solution liquor cresolis compositus.]

BERKSHIRE SALE AND MEETING

The first annual sale of registered Berkshire hogs conducted under the auspices of the Western Berkshire Congress was held at Sacramento during the California State Fair on September 7. The sale was a success. While the average price secured at the sale (\$100.00) per animal was not particularly high from the consignors' standpoint, the buyers were well satisfied with the prices and quality of the offerings. The high-priced animal of the sale was the Grand Champion Sow of the show at Sacramento, Grand Lady Mayhews 4th, exhibited and consigned by A. B. Humphrey, Escalon, California. She went to A. W. Foster, Hopland Stock Farm, Hopland, California, at \$500.00. This is a splendid sow, a daughter of Grand Leader 2d, and was well worth the price. The next highest priced animal sold went to James Mills, Hamilton, California, at \$285.00. She is Escalon Belle, a first prize junior yearling sow of the show, and also a daughter of Grand Leader 2d, consigned by A. B. Humphrey. Winona Mistress Piece 7th, third prize senior yearling sow of the show, consigned by Winona Ranch, Grants Pass, Oregon, sold for \$210.00 to E. R. Sheldon, Kenwood, California; and Royalist's Lady Belle, consigned by the University of California, was purchased at a like price by A. B. Humphrey, Escalon, California. Silbira Julia 23d, a daughter of Laurel Champion, consigned by Hollow

Hill Farm, Colton, California, went to J. L. Thatcher, Riverside, California, at \$200.00. A. B. Humphrey secured Miss Plattsburg A. from F. A. Brush, Santa Rosa, California, at \$225.00.

The annual meeting of the association was held at the Travelers Hotel in Sacramento, California, on the 4th of September 1916. Interesting talks and discussions led by men prominent in the Purebred

LIVESTOCK DIRECTORY.

REGISTERED AYRSHIRES—All ages for sale. W. J. Domes, McCoy, Oregon.

Berkshire Industry were given. Professor J. I. Thompson of the University of California spoke upon Self-Feeders: Their Place in the Breeding Herd and in Profitable Pork Production. Professor Thompson advocated the free choice system of feeding swine, saying that this method secured the best results on young stuff, and on hogs being fattened for the market. Mr. A. B. Humphrey of Mayhews and Escalon, California, gave a paper on Seed Animals in the Foundation Herd, in which he urged the necessity of the greatest possible care in selecting the foundation material for a herd. Judge Peter J. Shields delivered an interesting address on the general features of the swine industry. A paper, "Some Practical Suggestions in the Management and Feeding of the Breeding Herd," by F. R. Steel, was submitted. "Purebred Berkshires as a Business Proposition" was handled in a paper by C. M. Talmadge, Newport, Washington; and "The Needs of the Pacific Coast in the Swine Business," by W. S. Guilford, Willows, Cal.

In the open discussion that followed several prominent breeders of Berkshires emphasized and endorsed the modern tendency of the breed in conformation. Much less attention is now being paid to such less important points as marking, shape of head, sets of ears, etc. A motion was passed suggesting that it be the opinion of this body that judges at the fairs in the Berkshire classes should not discriminate against swirls. It was decided to hold the next Western Berkshire Congress meeting and sale at or near the first of February, 1917, at Davis, California. The next Western Berkshire Congress show will be held at one of the northwest fairs, the selection of which one to be left to the board of directors.

DUROC SALE SCATTERS HOGS.

With an average of \$89 on 33 sows and a little over \$57 on 7 boars the Rucker and Coppin sale held during State Fair week was considered highly satisfactory from a selling standpoint.

To the writer's mind the most constructive factor of the sale was the wide scattering of purebred hogs which was accomplished, the total number of buyers being 21 for the 40 head of stock sold.

While exceptionally high prices were received for some, the majority of the animals sold at prices thoroughly conservative from a farmer's standpoint, which was as it should be in all auction sales if the most good is to result.

Following is the list of buyers: F. A. Miller, Peters, Lamson & Walker, F. M. Johnson, J. J. Morris, W. D. Bennett, W. Higdon, C. C. Fimple, D. Rice, J. W. Copeland, W. P. Harkey, A. H. Votg, J. E. Thorpe, R. Q. Wickham, H. Eckle, J. J. Doty, J. R. Gallagher, J. M. DeVilbiss, White & Sawyer, F. N. Wood Jr., J. Jensen, G. P. Robinson.

The high mark of the sale was reached by the sow Monarch's Beauty, which, after brisk bidding, was knocked off by Col. Ben. Rhoades for \$500.

AYRSHIRES—Registered; all ages. E. B. McFarland, 412 Claus Spreckels Bldg., San Francisco.

THE VINTAGE FESTIVAL.

The fifth annual vintage festival held at St. Helena was a splendid success. Thousands were present to witness the vintage allegory, "Back to the Soil," written by Gardner de Veuve, principal of the St. Helena High School. Miss Clara Navone presided graciously as Queen of the Festival. The exhibits, which were in great profusion, spoke eloquently of the fertile soil and genial climate

of Napa Valley, more especially as exemplified in its grape harvest. The festival opened Friday, Sept. 8, and extended over a series of days, and included a varied program of entertainment.

Members of the Kern Motorcycle Club will participate in a coyote hunt on the plains north of Bakersfield at the end of this month. Coyotes are an increasing menace

THE DAIRY: AN AMERICAN GIFT TO CALIFORNIA.

(Continued from first page.)

racks for the milk pans made of oak and there was running water in the house, a piped from an aqueduct a mile and a quarter in length. He also had "a Durham bull worth \$2000" and was one of the "fancy farmers" of the first decade.

California System of Dairy Tenantry.—It was about 1860 that the system of dairy tenantry peculiar to California took form. In the coast region near San Francisco the lands were largely covered by Spanish titles, and these large tracts were cheaply obtained by men who had some money and some genius for finance. This coast region was seen to have large rainfall, through a long rainy season, a longer grazing season, a cool summer, and as all these things naturally made for cheap feeding and easy milk-handling, it soon came to be thought that the coast could have no rival in dairy production and this impression prevailed for nearly a third of a century until it finally yielded to the refrigerator and the demonstration of the dairy value of alfalfa grown with irrigation.

While then the impression of the dairy sovereignty of the coast region prevailed large tracts of land were secured, dairy cattle were gathered, either by importation or by crossing Mexicans and Texans with more or less pure-bred sires, also imported; sheds were built for milk racks, churns and vats; the cows were kept under the sky and milked in corrals floored with mud or dust. These sheds and corrals were built here and there on the property, and a bunch of cows and men, including a cook and butter maker, assigned to each. Later, these single places, to save the land owner from worry and trouble, were leased to different tenants; the tenant paying the owner a cash rent per cow and furnishing his own help and equipment and agreeing to raise a certain number of calves. For new building and other improvements the land owner furnished the materials and the tenant the labor. The owner had to keep the cows up to the number assigned to the ranch and for such supply he grew to milking age the calves the tenants furnished him. Roughly, this is the way the system began about 50 years ago and, in improved form as to stock, barns, dairy buildings and methods and reduced rent per cow, it still prevails in some districts of the state. It enabled many to get a start with small capital and to accumulate something with which to establish themselves as owners in newer dairy regions. It gave the pioneer land owners considerable money, some of which they used in securing better dairy stock and buildings and sometimes in improving pastures. One of the by-products of the system was the invention of many novel appliances useful in the old time, but now largely displaced by outfits belonging to newer methods of manufacture, and therefore chiefly of local historic interest. Thus, in early days, there came to be California butter rolls, boxes, churns, butter workers, etc., different from those used elsewhere.

Dairy Ownership.—In the mountains the dairies were established largely on government land and have

always been chiefly owned by the operators. In the newer lands of the alfalfa districts there is also a large prevalence of self-owning dairy farmers. This fortunate condition is one of the benefits of the establishment of creameries, and skimming stations which have ruled out the necessity for much investment on the manufacturing side, which was required in pioneer days. This has given the modern owner more time and sometimes more money to use in getting better stock and in seeking the results of better feeding and care than the pioneers ever thought of.

Dairy Development Slow.—But though dairying began very early its effort to displace the huge importation of butter and cheese from distant parts of the world, its progress must be counted very slow. Though it took only about five years to shut out grain and flour and only a decade or so to place California in the front rank of wheat exporting states, and even less to bring fresh fruit production to the limit of local consumption, imported dairy goods continued to move in freely until the third decade of American occupation and has never been wholly excluded at all seasons of the year.

The crest of the wave seems to have been reached in 1865, when the following protest was made:

Most of the stock brought into the State in early days by Western men was for the purpose of supplying the great demand for beef. Having overstocked the country they refused to sell at reduced prices and the cattle roamed over vacant lands in great herds, of little benefit to their owners and of great detriment to the farmers. And although in 1860 we possessed more milch cows in proportion to our population than any other state in the Union, yet for the six years ending in 1865 we imported 34,226,600 pounds of butter at a cost of \$9,768,346 in gold and during three years ending 1865 we imported 1,376,200 pounds of cheese at a cost of \$209,317 in gold, making an annual draft on our gold product of \$1,667,828 to pay owners of Eastern dairies for butter and cheese shipped to us when at the time we owned more than twice as many cows in proportion to population, than any of the states from which we bought these articles.

And to properly appreciate the weight of this anomaly it must be remembered that every dollar in gold was worth more than two dollars in the war currency which circulated at that time in the Eastern States.

But deep as is the impression of economic iniquity thus bulked, a concrete instance still has force. H. D. Dunn said in 1867 that he "visited in 1860 a farm in Sutter County, twelve miles from Marysville, the owner of which had 170 fine American cows coming daily to the corral and yet there was no milk for tea, and coffee and 'States butter' was bought for family use!"

From 1866 onward, local production of butter increased and importations were soon reduced from five million pounds a year to one million. It was not until 1878 however that local production of butter first equalled consumption—exports at one season about balancing imports at another. The local production of cheese more speedily reached the local limit, for in 1866 the record says: "We have produced more cheese than needed for local consumption, the estimated product being

SANTA ANITA RANCHO
ANOAKIA BREEDING FARM

FIRST ANNUAL SALE, OCTOBER 23rd and 24th.

ARABIAN THOROUGHBREDS: Two-year-olds, sired by Imported Stallion Ibn Mahrus, head of our Arabian Stud. Dams are the choicest thoroughbred mares of Santa Anita Rancho.

SADDLE HORSES: Fourteen of them, some of which are sired by Ibn Mahrus, world renowned imported desert saddle stallion, and Don Costano, a five-gaited Kentucky saddle stallion. These horses are mostly three-year-olds.

POLAND CHINA AND BERKSHIRE BOARS: Four to nine months old. Sired by famous Poland China herd boars—Banker's Boy and Glenview Wonder. And Berkshire Boars—Kintyre Laird, Grandson's Duke and Fashion's Longfellow 5th. The dams are from the very best blood lines. Most all these animals have winnings at World's Fair.

HOLSTEINS: We will sell a number of young bulls. Some aces and grandsons of the noted Prince Gelsche Walker, and bulls from one World-Record cow and two California State-Record cows.

Sixty females of the highest class will be consigned.

Write for catalogue.

WORK HORSES AND MULES will also be offered for sale.

WRITE FOR PARTICULARS.

W. H. TAYLOR, Superintendent.
Santa Anita, Cal.

1,610,000 pounds valued at \$200,000.

To show the increase in dairy production as related to State population, at about the dates named and the present time, these figures are interesting:

	Population	Butter lbs.	Cheese lbs.
1870	560,247	7,969,744	3,395,074
1915	3,064,000	67,522,409	6,105,775

Inquiry as to the reasons why butter production increased nearly eight and one half times and cheese production less than twice, while population increased about five and one half times, opens a large field which we cannot enter at this time.

California Dairy Stock.—California stock has been known for the average excellence of dairy animals for the last quarter of a century. Favorable natural conditions for cattle and commendable effort to breed up to good character and capacity are to be credited with this general attainment which expert observers have often recorded. Beyond this, we have bred cows with high individual performances and have even made world records in this line. It will be interesting to note a few facts of the beginning on the line of dairy cattle improvements in California, in addition the notes on the lines of foundation stock which have been made.

It was natural that the first effort to secure better horned stock should have been manifested in free importation of Shorthorns, or Durhams, as they were universally called half a century ago. California dairying began when there was a beef famine on, because of the free-killing of Mexican beeves to feed the miners. It was not sure whether beef or milk stock would be the more profitable to grow and so the pioneers hedged by choosing a dual purpose breed. Besides, the importance of special dairy breeds had not yet clearly dawned anywhere in America though well demonstrated in European practice. For all cattle purposes the Durham had only one rival in Eastern estimation in 1850, and that was the Devon. Californians with their heavy purses paid long prices for the best they could get of these two breeds. Durhams and Devons arrived before 1856, for in that year both breeds were shown at the State Fair, but we have no record of the exact year when the first arrived. There was a bull "worth \$2,000" and a "cow that cost \$500" shown in 1856—presumably the prices paid for them in the East, and not small prices for those days. For nearly a decade improvement of the common stock rested solely with the Durham and Devon—the former largely leading in numbers and frequency of importation. It is not too much to say that when an "improved animal" was mentioned it generally signified a Durham grade, and it was the influence of the Durham that one saw most clearly and frequently on dairy farms for two or three decades later. In 1863 Alderneys and Ayrshires were publicly shown, and of these two the Ayrshires were more prominent for nearly ten years—alone disputing for favor with the Durham and Devon. In 1872 Jerseys and Alderneys appeared as distinct breeds, but were merged and became Jerseys after that: Jerseys and Ayrshires winning sweepstakes for best cow and heifer respectively. This was at the State Fair and in the same year, 1872, the Holstein was

shown at the Santa Clara Valley district fair. The Jersey was, however, the breed which made the first drive on the Shorthorn, the Ayrshires declining in interest and the Holstein not appearing in force until some years later. The Jersey bull on the shorthorn grade cow, was very popular in the latter '70's, and, until the Holstein-Friesian invasion began in the '80's, held undisputed sway. For three decades past the Jersey and the Holstein Friesian have contended for supremacy in the minds of the doubtful—each remaining supreme, usually, when one has his mind made up either way. During the last decade several other breeds have made entry, and more will be heard of some of them as time goes on. At present, however, one sees California dairy herds largely black and white—either because the style is more numerous, or larger, or black and white can be seen farther than red and yellow.

Dairy Organization.—California dairy interests have been advanced by several organized efforts. The first State Dairymen's Association was organized in 1876, and held several good annual conventions, but could not command sustaining interest. In 1882 another State Association was organized to fight oleomargarine, and secured the State law restricting the sale of it, but provided no ways or means for the operation of the law itself. In 1893 another dairy association was formed to promote the industry through demonstrating profitable lines of export and to protect it from competition with bogus products. This association secured the establishment of the State Dairy Bureau in 1895, which is still doing good work. The association was otherwise forceful for several years, but failed of adequate popular support. In 1901 the Creamery Operators' Association was organized, by those chiefly on the manufacturing side as the name indicates, and since that time it has continued a very useful and energetic association. Since then still another effort was made to organize dairy farmers in a society of their own, but it went the way of the three earlier undertakings of the same kind, but rather more quickly than they did. It has been announced that another effort to organize California dairy farmers would be made at Ferndale during the last week of this month, when the Creamery operators hold their convention at that place. We trust it will succeed. Dairy farming in California is becoming more beset by problems of all kinds each year, and the only way producers can secure justice is to strongly present to the public mind facts and convictions from their own point of view. An industry which produced a value of \$38,377,342 in 1915 for the advancement of California should have a powerful and permanent organization of producers for promotion, etc.

Thus we have skimmed the dairy industry of California, and lavishly poured out the skimmed milk for the nourishment of our readers. The cream we still have in the can for later use, for it is the relation of the dairy industry to mixed farming, to soil renovation, to greater growth of better forage plants, to the growth of better animals and to the greater prosperity of California men and women, which calls for effort of the widest public value.

Veterinary Queries.

MARE PAWS AND ROLLS.

To the Editor: A six-year mare four months in foal acts as if she were in pain in her bowels. She paws and rolls a great deal and lies down often. She does not seem to strain. She passes gas. Feeding ripe wheat hay and rolled barley. Appetite good. Pains come after watering or driving. At times she runs her tongue out as if trying to get something out, but nothing is there except a swelling just back of the front teeth which I understand is lampers.

Two ducks have gone blind and act intoxicated. The lungs of one were in terrible condition, hard and gray on the outside.—C. B. H., Gray Mountain.

[Give this mare a purge consisting of one quart raw linseed oil and two ounces turpentine. There is no such thing as lampers. The ducks died of ptomaine poison due to some substance they had eaten.]

DANGER OF CAKED BAG.

To the Editor: A 3-year heifer has been giving milk since July last year. She is due to calve Oct. 1. With her first calf, I came near losing one-quarter of her bag as it was swollen and had but little milk. Later it came in and now gives about half of all the milk. Should I milk her right along, or dry her up and milk a few times before calving, or not milk at all and use some other plan?—W. F. R., Gridley.

[It is better policy to dry up completely from four to two weeks previous to calving by gradually letting up on the milking.]

CALVES' BLADDERS FILLED WITH RED WATER.

To the Editor: Two 4-months calves died. They were running in creek bed with running water willows, and alders. Were feeding some alfalfa hay. The first I observed, they did not eat, urinated often, tinged with blood. One lived two days; the other, one. I opened the latter. Its gall was two inches in diameter and more than five inches long. Kidneys somewhat enlarged. Were feeling fine within two days of death.—C. W. S., Morgan Hill.

[This is blackleg. Vaccinate your calves each year for this trouble.]

COW COUGHS.

To the Editor: My cow has a dry cough and breathes heavily when she runs or walks uphill. Does not react to tuberculin test. She had milk fever when she came fresh. The veterinarian said the cough was from strong medicine he gave her, but five months have passed and she still coughs.—A. A., Sebastopol.

[In all probability this cow has tuberculosis regardless of the test. Have her tested again.]

GRANDSONS OF TILLY ALCARTRA

Prince Alcartra Korndyke,
Best bred son of Tilly Alcartra.

Our supply of these young sires is always limited, but we have a few now which we are offering at very reasonable prices.

Write us at once, or call and see the herd.

J. S. GIBSON CO., Box 97, Williams, Cal.

"THE NAME GIBSON INSURES QUALITY."

COLT NAVEL SWOLLEN.

To the Editor: A colt now four months old, contracted serious navel trouble soon after it was born. The veterinarian seemed to have pulled it through, but this morning it is badly swollen and hard. Bathed it with liniment made of egg, vinegar, and turpentine and gave the colt a dose of nitre.—H. G. H., Amsterdam.

[This is an abscess which should be opened and the colt given navel vaccine.]

ITCHY TAIL HEAD.

To the Editor: For two years a cow has had itchy places two inches across either side of the root of her tail. She licks it raw. Have tried Dr. Hess' Dip, but as soon as the dip leaves it, she licks it sore again, but it doesn't spread.—G. W. I., Watsonville.

[Paint with tincture of iodine daily for several weeks.]

Smith Valley, Nev., is becoming a turkey valley. There are about 3000 turkeys there.

Raising Poultry for Profit

FOWLS CATCH CHOLERA ONLY THROUGH WOUNDS.

[Written for Pacific Rural Press by Geo. H. Croley, President of Federated Poultry Association of California.]

A very interesting discovery was recently made at the Institute of Hygiene of the Veterinary School at Pisa, Italy, in relation to Fowl Cholera which is said to be the most infectious of poultry diseases. It was demonstrated that infection seldom occurs through the channel of the alimentary canal or throat, as is commonly supposed, but that the virus almost always gains entrance to the system through wounds or abrasions on the surface of the body—most frequently on the feet—or the infection may occur through lesions or injury of the mucous membranes of the throat or nose. It was thoroughly determined that even the swallowing of virulent blood and slime of the fowls that had died of the disease does not result in infection, notwithstanding they were given in large quantities and repeated several times. The digestive system of the fowls seems powerful enough to completely digest the germs and render them harmless. The results of this experiment should stimulate careful observation, by poultry keepers and experimenters, of other virulent poultry diseases such as roup, white diarrhea, and blackhead of turkeys.

QUESTION ANSWERED.

[Written for Pacific Rural Press by Susan Swaysgood, Pomona.]

Turkeys Strain.—My turkeys act as if they are trying to swallow; also strain like hens that are egg-bound. They eat well, have wheat and alfalfa range. I notice more in the morning are affected. Some are early hatched large birds, while others are small ones weighing three or four pounds. One died and we thought it was from diarrhoea, but these that are sick do not appear to have any diarrhoea. Will it develop later?—C. B. S., Lancaster.

These turks are suffering from a mild form of gastritis, which causes constipation and diarrhea in turns. Probably the trouble is due to some-

thing they have found to eat on range that started indigestion. A little irritation soon attacks the whole internal organs, if neglected. If you could confine the birds to a yard for a few days and give them all a dose of castor oil in a little warm mash, allowing a tablespoonful for each large bird and a teaspoonful for each small one; then make a mucilaginous drink by boiling flaxseed and rice in plenty of water, pour the water off the grain and give the birds that to drink instead of water, a few days treatment should put them all right.

SCRATCH FEED AND MASH.

To the Editor: What would you consider the proper amount of scratch feed for 100 pullets seven months old? I keep some before them all the time, a green feed at noon and give them the scratch early in the morning and evening.—B. V. G., Los Gatos.

[Answered by Geo. H. Croley, San Francisco.]

[We would not feed a stated amount of scratch feed, but would give them about as much mash as they would consume; and when they have eaten it, feed them the same weight of scratch feed.

This is because the mash is higher in protein, while the scratch feed is higher in carbohydrates. Hens prefer the scratch feed, and will eat so much of it that they will get too fat to lay well if allowed to eat all they want of it, and they will not eat enough of the mash to make an economically balanced ration unless it is fed to them first, alone, and while they are hungry.

STATE FAIR POULTRY SHOW.

With nearly one hundred exhibitors and approximately 500 birds, the 1916 State Fair poultry show has passed into history as the best exhibit ever held at Sacramento. New, convenient, and commodious buildings and an excellent list of premiums brought out some of the best entries that have ever been cooped at the State Fair. Competition in some varieties, it is true, was not strong, but the quality in every class was exceptionally good for this season of the year.

Probably the surprise of the show was the excellent exhibit of Bantams, more than 200 specimens being shown of several varieties. Judge Robt. V. Moore pronounced it the premier bantam show of the Pacific Coast, the sensation of this class being a Black Cochon Bantam cock.

C. G. Hinds of Oakland, assisted by N. E. Luce of Los Angeles, placed the awards in all classes excepting bantams and pigeons.

The large, light sanitary addition to the building gave breathing room for fowls and visitors, so that the large exhibition was housed comfortably without crowding.

Waterfowl had a merry time splashing in this new cement tank fenced off by wire netting so they could stretch their wings. In this class, our old friend W. A. French of Stockton had what was judged to be the best pair of both ducks and geese.

Poultry Breeders' Directory.

BABY CHICKS NOW READY.—Hatches every week. Write for special "Fall Chick" circular. See why Fall chicks pay. R. I. Reds, Barred Rocks, Black Minorcas, White and Brown Leghorns. Campbell Poultry Ranch, Campbell, Cal.

CLOSING OUT—FOR SALE CHEAP.—3 Electric Incubators, 576 egg capacity each. 16 Electric Brooders, 150 chick capacity each. Complete with circuit breakers, thermostats, connecting sockets, etc. Address T. R. Jacobs, P. O. Box 395, San Mateo, Cal.

CROLEY'S DRY MIXED INFANT CHICK FEEDS for twenty-five years have been California's standard feed for baby chicks. Insist upon getting same from your dealer. Manufactured by GEO. H. CROLEY CO., Inc., Poultry Supplies, San Francisco.

BUFF ORPINGTON CHICKS.—September and October delivery. First hatch Sept. 13th. Orders taken from 25 to 150; \$15 per 100. Eggs \$1.50 per 15; \$8 per 100. The Ferris Ranch, Rt. 2, 144 D, Pomona, Cal.

BARRED PLYMOUTH ROCKS.—"The kind that Win and Lay." Eggs for hatching and choice stock for sale. Have bred Barred Rocks for over nineteen years exclusively. Write for catalog showing winnings at California's leading shows. Chas. H. Vodden, Box 396, Los Gatos, Cal.

MACFARLANE STRAIN WHITE LEGHORN Cockerels.—April hatched, Hoganized, \$1.00 each, \$9.00 per dozen. Chicks to order, 10c each. Newton Poultry Farm, Dept. 1, Los Gatos, Cal.

THE SANTA CLARA VALLEY HATCHERY solicits your orders for Fall and Spring delivery in 8 breeds of baby chicks. Order early and get the best. Jos. A. Bihn, Lincoln Ave., San Jose, Cal.

FOR SALE.—R. I. Red Pullets, 5 mos. old. Good stock. White Indian Runner ducks, full feathered; fine laying strain. Prices reasonable. Mrs. R. D. Kellogg, Richfield, Cal.

EASTMAN'S BRED TO LAY Barred Plymouth Rocks, Chicks, Eggs, Cockerels. Fairmead Poultry Farm, Fairmead, Cal.

DAY-OLD CHICKS.—These chicks are hatched from our own flock of 8,000 Utility White Leghorn Hens. George Bros., Petaluma, Cal.

CHICKENS, DUCKS, GEESE, GUINEAS. Pea Fowl, Pigeons, Wm. A. French, 546 W. Park St., Stockton, Cal.

WHITE WYANDOTTES.—Blue-ribbon winners. Eggs \$2 to \$5. Chicks, pullets, cockerels. R. W. Strawetski, Route 2, San Jose, Cal.

TURKEYS, DUCKS AND GEESE.

HART'S BRONZE TURKEYS AND EGGS.—Large reduction in price of stock. Order now for fall delivery. Free Circulars. Albert M. Hart, Clements, Cal.

Honest Injun!

Savage Tires—as honest as the proverbial honest Indian.

From the first to the last mile of service you know that you are getting more than full value for the reasonable price you paid.

You are 1000 miles to the good at the start, because of our guarantee mileage allowance.

And at the finish you're more than likely to find yourself anywhere from 1000 to 10,000 miles better off than you would have been with the tires you formerly used.

Honest materials and manufacture, honest prices, honest service.

GLOBE MILLS,
LOS ANGELES, CALIFORNIA

Floral Department.

[By Geo. N. Tyler.]

Roses that have been resting for the last six weeks should now be watered. Prune back all weak and blind wood, but not so severely as for winter pruning. Scratch in a liberal coating of bone meal around them, and mulch them with half-rotted manure. Spray the tops two or three times a day for the first week or two as this helps them to break nicely.

Sweet Peas.—If you want some early sweet peas you can plant seed from now on. If you trench and enrich your bed with thoroughly rotted manure and a liberal amount of bone meal to the depth of eighteen inches (some growers enrich to the depth of two feet) you will be surprised at the results, as sweet peas are deep-rooter plants. By planting early you get a good growth before frosts, and if any variety fails to grow you have plenty of time to re-plant. I would advise sowing the Spencer varieties, as they have taken the place of the old varieties. Do not sow a mixture, but sow each color by itself if you have only enough seed for four feet of a row. Sow the seed two inches deep and give a good watering after planting. Cover with lawn clippings or clean straw to prevent them drying out. Do not sow too thick—two inches apart is close enough for planting—and after they are up, thin out to six or eight inches apart. When they have made a growth of six or eight inches, give them supports to run up on. I use six-foot coarse chicken wire, two or three inch mesh, with stakes or posts every eight feet, for the weight of the vines climbing to the top of the wire is pretty heavy when wet. There is a system of growing where the vines run up ten and fifteen feet, and no side shoots are allowed to grow; even the tendrils are cut off. But this is too much work and is only for exhibition flowers.

Violets should now be mulched with one or two inches of cow manure, and all the runners kept picked off if you want early flowers. My plants of Princess of Wales are now making flowers, but they are small yet, and will not be good till the weather gets cooler.

Asters are now in full bloom. While blooming they require a great deal of water; and a light application of liquid manure once a week will greatly increase the size of the flowers.

Now is the time to prepare your bed for next year's plants. Spade in a liberal amount of half-rotted manure and a liberal amount of bone meal. Do not rake it, but let it stand till next spring.

TOMATO SAUCE.

Stew half a can of tomatoes and half a small onion ten minutes. Rub all the tomato pulp through a strainer. Cook one tablespoonful of butter and one heaping tablespoonful of flour in a granite saucepan. Add the strained tomatoes gradually and a teaspoonful of salt and a dash of white pepper. This sauce is delicious poured over and around well-browned lamb or veal chops and is equally good for macaroni.

THE HOME CIRCLE

THE TWO SIDES OF IT.

There was a girl who always said
Her fate was very hard;
From the one thing she wanted most
She always was debarred.
There always was a cloudy spot
Somewhere within her sky;
Nothing was ever quite just right,
She used to say, and sigh.

And yet her sister, strange to say,
Whose lot was quite the same,
Found something pleasant for her-
self

In every day that came.
Of course things tangled up some-
times

For just a little while;
But nothing ever stayed all wrong,
She used to say, and smile.

So one girl sighed and one girl
smiled

Through all their lives together.
It didn't come from luck or fate,
From clear or cloudy weather.

The reason lay within their hearts
And colored all outside;
One chose to hope and one to mope,
And so they smiled and sighed.
—The Children's Friend.

WHAT KITTY FOUND IN THE DRAWER.

[Kate Randle Menefee.]

Grandfather Bryant sat down before the old mahogany secretary and turned the key. Then, pulling out the first long drawer, he placed his hand far back into its recesses and drew out the roll-top desk.

Kitty, his little grand-daughter, peeped around the door-facing, and, seeing that he was occupied, she tiptoed softly into the room. If there was anything Kitty liked, it was to be allowed to view the contents of Grandfather Bryant's secretary. In it were portraits of gentlemen with ribbon-tied hair, ladies with powdered curls, queer jewelry, and bundles upon bundles of letters yellowed with age.

As Kitty made her way on into the room she was wondering if her grandfather could have forgotten that this was her birthday, or his promise to let her have a peep into one of the secret drawers when that important day should have arrived. He was busy, it seemed, so of course she would not bother him; but she would just take another look at the mysterious drawer, and try to imagine what she would see when it was opened. How she did hope grandfather would remember!

At last she was so near to Grandfather Bryant that she could place her hand upon his shoulder, but still he did not turn to look at her. Kitty wondered how grown-up people could be so absorbed in old yellow letters that they could forget one's birthday. But what was this, —there was grandfather's hand approaching the little secret drawer, —and—yes, to be sure, there! he had turned a funny little knob. First it went back, then forward, then back, then all the way round, then—but there the drawer was open! Grandfather was smiling back at her, and must have heard her all the time.

"Oh, grandfather, it's my birthday, you know," she cried, leaning over him and placing an arm about his neck.

"Yes, sir, that's a fact," acknowledged Grandfather Bryant.

"And—and—please, sir, you know what you promised," stammered the blushing Kitty.

"Let's see," said grandfather, "you were to look into a certain drawer, I believe."

"Oh, yes, sir, that was it," cried the delighted Kitty.

"Then, as this is the important day, perhaps you will look, Miss Kitty Bryant,—that is, if you care to."

"Oh, grandfather, if I care to!" exclaimed Kitty, so excited she did not see the merry twinkle in her grandfather's eyes.

Kitty had been eager to look, and yet, now that the time had come, she found it had been lovely to have the surprise to look forward to,—but she must look, and look she did. There in the little secret drawer she saw a little green satin teakettle, its little brass handle curving over its top, and its spout pointing right up at Kitty. On its satin sides were delicate little pink blossoms, and it was indeed a very pretty little teakettle.

"Take it up in your hands," prompted Grandfather Bryant, and Kitty carefully withdrew the kettle from its hiding-place.

"Why, why," she cried, "the top can be taken off!"

"Yes," agreed grandfather, "you may take it off."

Off came the little top, and from within a sound of a little "tick-a-tock, tick-a-tock," greeted the little girl.

"Oh, grandfather," Kitty cried, placing her eyes nearer to the open top, "there's a little watch inside!"

"Well, well," mused grandfather, taking a peep, "and so there is."

Kitty reached in and drew the watch out. It was an old-fashioned, key-winding one, decorated with blue enamel. The key was tied to the gold ring in the top of the watch, and on the inside of the case were the letters "K. B."

"It must have been grand-mother's," Kitty exclaimed. "It must have been!"

The mist formed in grandfather's eyes. "It was," he explained, "but now it is to belong to another little Kitty Bryant."

"Tick-a-tock, tick-a-tock," called the little watch.

Kitty placed her soft warm cheek against grandfather's. "I'm going to be the best little mistress to it!" she whispered.

Grandfather Bryant placed a trembling hand upon her sunny curls, saying, "Had I not known this, dear, I would never have trusted you with it."

"Tick-a-tock, tick-a-tock," agreed the little watch, keeping the exact time of Kitty's little heart, which was also going "tick-a-tock, tick-a-tock," with sweetness and joy.

"Bobby," said the lady in the street car, severely, "why don't you get up and give your seat to your father? Doesn't it pain you to see him reaching for the strap?" "Not in a car," said Bobby. "It does at home."—The Advance.

Mrs. Best's Letter.

My dear Friends: I had the privilege this week of attending the State Fair at Sacramento and of enjoying the new Woman's Building there.

This building is attractive in exterior and well furnished inside and is for the exclusive use of women, both for exhibition purposes and as a resting place. There are a few show cases, containing embroidery, crocheting, hand-painted china, etc., but the great feature of it is the large waiting room with comfortable chairs and settees, potted plants, long French windows opening onto porches and generous windows prettily curtained. At one side of this room is the nursery, fitted up with a couple of large beds and half a dozen cribs, high chairs, etc. Adjoining this is a small kitchen where milk may be heated or food prepared for infants. This nursery is in charge of a capable nurse and there is a doctor on duty also at all times.

At the other side of the large waiting room is a retiring room supplied generously with toilets, wash basins and a telephone.

It is a well-arranged, convenient building and to see the crowds of women there with their small children proved how much it was wanted and enjoyed.

In the columns of this department a few weeks ago, was a description of a rest room at Ripon for women, that although small and not well furnished, still provided the same kind of comfort and convenience that this beautiful building does, and I hope the time is not far distant when every small town and every fair grounds will have a suitable place for women to rest and attend to the wants of their children.

One of the things that I am sure all you mothers would have enjoyed seeing with me was the exhibit of school work.

With the exception of two displays sent in by a High and a Normal School all of the exhibits in this tent (and they were numerous) had been furnished by grammar school children—most of them being produced in the seventh grade. They consisted of baskets made from reed and raffia, manual training work in wood and garments, some made by machine, others by hand, and many of them either embroidered or trimmed with a hand-made lace.

But not alone in the domestic arts were women in evidence at the Fair, for in the poultry exhibit, some of the exhibitors were women and there were at least three women who had creditable exhibits in pure-bred stock—these women are successful enough to prove that a woman with brains and determination can succeed at anything she wishes to do. Rosabella Best.

CARE OF GLOVES.

When putting gloves on, always button the second button first. Then you can more easily fasten the first button without tearing the kid. To remove never pull off by the fingers; turn them off wrong side out and let them air before turning them to their proper shape. Always lay gloves lengthwise—never roll them.

Good Health.

[By H. E. Pastor, M. D.]

Infantile Paralysis Again.

So great is the concern over the spread of this dread disease, and in view of its sporadic appearance on the Pacific Coast, the writer has been asked to add something to what was here written last week. There is little else to be said without going into the matter too extensively for our space limits. The symptoms were epitomized last week, also preventive measures were briefly outlined. In a circular issued on this subject by the Health Department of New York City, which lies before us, is found one or two points of prevention not covered in last week's resume, though they might occur to any parent endowed with ordinary gumption. It says: "Keep your children clean. Bathe them frequently. See that they keep their hands particularly clean. Be sure that each child has its own clean handkerchief." This is very good advice, but should not require an epidemic to suggest its observance.

Spices, Good and Bad.

The expression "good and bad" is not here intended to designate the quality of the various spices (through it might do so with propriety), but rather their physiological effect on the human system. In the late widespread effort to discredit chemical antiseptics, such as benzoic and salicylic acids, etc., as food preservatives a singular oversight is noticeable—little or no reference has been made to our common food condiments, whose value as fruit and vegetable preservatives is familiar to all, but whose relative merits are not so well known. Mustard and cloves are both active destroyers of germs which cause food decay, and at the same time are comparatively harmless otherwise. Cinnamon, nutmeg, mace, and allspice are all valuable in their respective spheres of usefulness, as well as palatable, their antiseptic properties as well as their palatability being attributable to the aromatic essential oils which they contain. The peppers, black and red, though so widely used, should be indulged in sparingly, as they are strongly irritant, and where used too freely are responsible for many cases of stomaclic ulcer and inflammation of the kidneys. The same objection applies, though in less degree, to ginger. As nearly all spices are subject to adulteration, care should be taken that only dependable spices are bought.

The Cost of Neglect.

A news dispatch of the 4th inst. states that a young rancher living near San Pablo had just died from the effects of a rabbit bite. It says that the victim paid no attention to the wound for a day. The teeth of nearly all animals are reeking with disease germs, and a bite from one should be treated immediately with some antiseptic—a solution of carbolic acid, permanganate of potash, peroxide of hydrogen full strength, an application of Antiphlogistine, or at least cleaned with soap and water, and soaked in water as hot as can be borne for 20 minutes or half an hour. Treatment should be repeated until symptoms disappear.

"Hurry, children—I've got a real treat for you."

The Wheat Yield Tells the Story

of Western Canada's Rapid Progress

The heavy crops in Western Canada have caused new records to be made in the handling of grains by railroads. For while the movement of these heavy shipments has been wonderfully rapid, the resources of the different roads, despite enlarged equipments and increased facilities, have been strained as never before, and previous records have thus been broken in all directions. The largest Canadian wheat shipments through New York ever known are reported for the period up to October 15th, upwards of four and a quarter million bushels being exported in less than six weeks, and this was but the overflow of shipments to Montreal, through which point shipments were much larger than to New York.

Yields as high as 60 bushels of wheat per acre are reported from all parts of the country; while yields of 45 bushels per acre are common. Thousands of American farmers have taken part in this wonderful production. Land prices are still low and free homestead lands are easily secured in good localities, convenient to churches, schools, markets, railways, etc. There is no war tax on land and no conscription.

Butter	32	33	33	—	31	31½
Eggs	35	36	37	—	37	37

Deciduous Fruits.

Local prices in most lines are pretty well maintained, with offerings of some varieties decreasing. The

berry list has been narrowed down, strawberries are higher, though raspberries and huckleberries are lower. Astrachan apples have been cleaned up, bellflowers are rather weak, as the crop has turned out above expectations. Newtowns are moving in good shape, with strong shipping demand. Bartlett pears are higher here, but have slumped in Eastern market. Peaches are lower, with heavy offerings of rather poor stock. Quinces easy and plentiful, black figs have been shaded. Watermelons have been marked up sharply, and casabas are becoming a prominent feature. All lines of grapes have stiffened up a little, while offerings are liberal they clean up readily, quality in most lines being good. Wine grapes bring \$16 to \$18 per ton.

[Wholesale prices, San Francisco.]

Huckleberries, lb.7 @ 8c
off grade3 @ 5c
Raspberries, chest4.00 @5.00
Strawberries, chest2.50 @4.50

Dried Fruits.

As has been expected for some time, the dried fruit market in general is taking a strong turn for the better, and local packers report satisfactory movement to consuming markets. The situation favors an unusually large domestic consuming demand for the coming season, and a fairly strong market is expected from now on. Peaches are moving off in very satisfactory shape at the advanced prices. Apricots, which were neglected for a time, have been marked up another ½ c., and all offerings at present figures are rapidly absorbed. Figs quite firm, most good stock being already out of growers' hands. Packers again out after prunes, market is very strong, with prices slightly higher. [Net to growers, bulk basis, f. o. b. shipping point.]

Apples, new crop4½ @ 5½c
Apricots, per lb. 1916	12½ @13 c
Figs, white, 19165 @ 5½c

Prunes, 4-size basis, '16	5¼ @ 5½c
Peaches, old5 @ 5½c
19165½ @ 5¾c
Pears6½ @ 7 c

Citrus Fruits.

Eastern citrus auctions are a trifle lower on lemons, but about the same as last week on oranges. At New York on Monday, Sept. 11th, valencias averaged \$2.90 to \$5.95 per box, and lemons \$5.85 to \$6.75. At Chicago the same day valencias averaged \$3.95 to \$4.90 per box, lemons \$4.95 to \$6.55. Shipment to date for the season now are about 30,000 cars of oranges and 6,500 cars of lemons. It is estimated that about 2,500 more cars of oranges will be shipped by the end of the season.

Western demand for oranges has caused a shortage at shipping points, and values have been advanced sharply, this being reflected in a corresponding jump in the San Francisco market. The local movement is not heavy, as deciduous fruits are getting most attention. Lemons in good demand for the last week, grapefruit also moving well.

Special Deciduous Market Report.

By J. L. Nagle.

The increased shipments and inferior quality of Malagas from several districts has considerably affected Eastern markets, with the result that inspection is very severe and demand not as responsive as on Tokays, which are being purchased readily at high prices and in fact the demand for Tokays exceeds supply. Malagas, however, on good stock is active in the small markets. There has been some complaint about the quality of the Tokays, the first shipments having contained shot berries to a very large extent, which did not carry and caused considerable decay.

The late Peach market, with the exception of Clings, has been affected by Eastern competition. Had the Salways and other late freestones moved East when the trade wanted California peaches, all cars would have been consumed at satisfactory prices but this late variety does not color sufficiently to warrant Eastern shipment when the demand is at its height, consequently growers are forced to withhold shipment awaiting color. The demand for Clings,

however, has been exceptionally active and though some varieties have not been holding up in transit, sound fruit has been realizing exceptionally high prices.

There is also a very strong demand from all sections of the country for California wine grapes in lugs, prices ranging from \$20.00 to \$22.50 net f. o. b. California. Whether or not this will continue long is speculative, as Eastern growers are willing to sell on board the cars at \$8.00 to \$10.00 a ton.

The following prices have ruled for the week:

New York—Tokay grapes averaged \$1.57; Malaga, \$1.25; Muscat, \$1.00; Cornichon, \$1.55; Bartlett pears, \$2.65; Levy peaches, \$1.00; Salway, 75 c.; Orange Cling, 95 c.

Chicago—Tokay grapes, \$1.25; Malaga, 95 c.; Salway peaches, 65 c.; Phillips, 76 c.; Bartlett pears, \$2.15.

Total shipments to Sept. 11, 10,937 cars; total shipments same date 1915, 8730 cars.

Special Livestock Market Report.

San Francisco, Sept. 13, 1916.

Cattle—The local dressed meat market is weaker and prices have been cut accordingly. Few feeders have been bought in Northern California or Nevada as yet and it does not seem probable that many will change hands at the present holding prices on account of the high prices of hay and grain in all of the feeding districts. The same condition is apparent all over the country.

Hogs—The supply at this market has been steady for the past three

weeks, with stubble hogs improving in quality. The market is being crowded with lightweights and packers have shut off entirely on that class for the present.

Sheep—The big end of the sheep supply from all over the West is being attracted to Eastern markets on account of the prevailing high prices there. Locally, supplies from northern California and Nevada are meeting the requirements.

Wool—There is little to report. Buyers here are free sellers but claim there is no market.

P.R.P. 9

SUREMILK

**The Feed
That Tells
In The
Flow**

THE AVERAGE COW requires a daily ration of about one pound of digestible protein to five pounds of digestible carbohydrates, to produce her full flow of milk throughout the year.

SPERRY SUREMILK

an easily digested, uniformly ground grain concentrate, low in protein, supplies the necessary amount of carbohydrates, while alfalfa, the cheapest and best roughage grown, furnishes the requisite protein. This mixture assures the greatest Quantity Milk Production, with the least amount of energy, at the lowest possible cost.

A Home Folks Gathering, and Water.

How a Home-Loving Community Holds a Home Folk Fair to Attract More Home Folks Settlers.

[Written for Pacific Rural Press.]

AT FIRST glance there is nothing to distinguish the South San Joaquin Community Fair from the other small agricultural shows you have attended in all parts of the State. There are the familiar tents, the merry-go-round, and row after row of automobiles which seem to be the symbol of agricultural prosperity nowadays.

You first realize that this fair is different from others when you begin feeling in your pocket for the coin with which to gain admittance. You look for the ticket seller, then the ticket collector. Both are missing. You ask the man next to you what has become of them and he tells you, "We don't have such critters here." So in you go.

"Pretty good little show, isn't it?" says a cordial speaker, and you explain to him that you have just arrived. That's his cue to get busy. No longer are you a stranger in a strange land. Your chance acquaintance knows everybody he meets and you do too as quickly as he can introduce them to you.

"Here's a man from Manteca I want you to meet," you are told. "That's where we held the first of these fairs last year. This year it's Ripon and next year Escalon."

Before your guide can pull you away, your newly made acquaintance from Manteca informs you that since the water came, two years ago last May, his section has started to develop along agricultural lines in real earnest. Alfalfa leads, but 4000 acres of sugar beets have been planted this year and the yield has been highly profitable. Melons, which at one time, before the water came, made the Manteca district famous, are still an important crop, as are also Indian corn, sorghums and beans. "But say, why can't we jump in my machine and take a trip up there?" he asks. It's only seven miles from here and we have the State Highway connecting the two towns."

Assuring him that you have been through Manteca both by rail and auto and that you'll drop in and see him some day, you follow your guide to the refreshment booth where the ladies are serving ice cream and soda pop. Hung conspicuously above this booth is a sign reading "Parent Teachers' Association."

"Wouldn't believe all this came about through the ladies, would you?" asked our guide. "Fact, though. A farm woman up here a few miles conceived the idea of holding these community fairs. She took her idea to a meeting of the Parent Teachers' Association and the way those mothers hustled us men folks around to their meetings was a caution. Of course they had their way and a good way it was, too. Did a lot of good. People got better acquainted with each other and saw what could be grown. But say, I'm monopolizing all of your time and I promised to help put up an exhibit over in the other tent. Hey, John, here's a man wants to see what water and South San Joaquin Irrigation District soil does. Show him around, will you?"

Now John was from the Escalon section. Over his way alfalfa, dairy cows and hogs predominate, the same as around Ripon. Like all of the 71,000 acres served with water from the irrigation district's ditches the farmer in the Escalon country has plenty of water. "The only thing we need," he assures you, "is more people. We've got thousands of acres of as fine soil as can be found in this South San

Joaquin District. We are close to tide water, have good transportation facilities by rail, boat and motor truck and are close to the metropolis of the State, but land and water won't produce without farmers. Of course we've only had the water two years and new people are coming into the district every day. Not so fast as we would like, but you see all of the boosting this country has ever had is what we who are establishing our homes here could do. As a matter of fact we are just beginning to realize the possibilities of the district ourselves. Take this booth, for instance. There are 131 different varieties of field crops and vegetables that one man grew on five acres of land. Few of us ever imagined so many different things could be grown here. Personally I believe the thing most of us will eventually engage in is alfalfa, dairy cows and hogs. Some of us have got sidetracked into corn, beans, melons, sunflower seed, and this year into sugar beets, but with most of us this is a home-making proposition and we need a permanent form of agriculture. There's something over 3000 dairy cows in this district now, but that's only a starter. Our herds only average about

Scene at a Branching of the Canals of the South San Joaquin Irrigation District—the Life of a Principality.

11 cows each, but it's surprising how fast they increase. And hogs, too. Take hogs, good alfalfa, skim milk and corn like we grow and you have a hard combination to beat."

Advising our friend John that we were particularly interested in stock we were hustled through the rest of the fruit, vegetable and field crop displays, stopping long enough to see the school exhibits and to say hello to bankers, farmers, irrigation engineers, etc., all of whom John had a good word for, then past the Farm Adviser's booth, another important factor in the development of this newly watered empire, through a poultry exhibit that was highly commendable, past innumerable farm utensils, finally arriving at the stock sheds.

Horses, dairy cattle, hogs, sheep and goats were on exhibit. Most of them, you knew at a glance, belonged to men who made their living with them. They weren't showing for money prizes.

"I just brought my stock in to help out," was the common response to our questioning. And that, we found, is the reason no gate receipts are necessary. Everybody puts his or her shoulder to the wheel and helps. The sole aim of everybody seemed to be to further the interests of the communities embraced in those 71,000 acres of irrigable lands.

As we started to leave we felt another elbow in our ribs and looking around found our first made acquaintance. "Say," he said, "if you write anything about our show for your paper don't forget to say that the irrigation ditches are extended to every 40 acres, that we have concrete gates, a new reservoir that will hold 35,000 acre feet in addition to our regular supply. What! got to catch a train. Well, be sure and be at Escalon next year. Better than ever, you know."

EDITORIALS

THE WEEK.

AS THE edge of the interior heat is dulled by shortening days and southerly sun, and as the grinding surfaces of coast winds are smoothened by the inflow of southerly breezes, there come to California the delights, the inspiration, and the opportunities of the most distinctive subdivision of our seasonal year—the autumnal springtime. It is distinctive because it is peculiarly our own; no other State of this country has it in the duration of its joyful influence upon the life of man and in the depth of its industrial significance. The poets have poured out most mellifluous song as the glories of the Eastern Indian summer shone upon them, but Indian summer is the prologue to a tragedy—the smiling salutation among creatures of the organic world entering a dance of death; we, about to die, salute thee. In what sharp contrast comes the California vernal autumn, the time of sprouting seeds, of flower-decked fields, of new garden-bloom; the haven of migrating northern birds; the home of winter-flying butterflies! And to mankind there comes more than the joy of these things—the awakening of energy, the inspiration to action, the suggestion to go to work, not only for immediate achievement, but in seasonable preparation for a whole year's attainment, and often the actual measure and price of a whole year's reward. September!—the birth of a new year, not only for all-enveloping nature, but for most that man has industrially to do with it. September!—the birthday of the California spirit, in the breadth of life's enjoyment, in the impulse to new enterprise, in new loyalty to the State and its advancement, in incentive to a new and stronger stroke at common work, which becomes a man and proclaims his title to his birthright in this favored land!

A YEAR OF FAIRS.

THE year of the greatest of all world fairs, the Panama-Pacific, is naturally followed by the year of California fairs, of which this issue continues to remind the reader. We have now, in continued excellence, the California-Panama Exposition at San Diego, which is now at the service of Californians for the objective of an autumn trip by train, steamer or State highway, before the new flock of Eastern winter-fliers arrives later in the year. We are also having a series of county and district fairs, which are awakening unusual interest among our own people in different parts of the State. Nor are they lost upon visitors from abroad, for the State is unusually full of tourists, although the threatened railway strike did send many of them scurrying homeward, wishing now they had not, for it was a deep philosopher who said that "when a man found that he could do a thing, he didn't want to." It is worth noting, in connection with outlines in other columns, that we have two new phases of local fairs this year; the fair of the Farmers' Bureau, for the purpose of making itself wiser, of which a good instance is that in Napa county, and the fair made by a community with the declared purpose of making itself larger, like the event at

Ripon, of which an associate gives an appreciative account on the first page of this issue. The three settlements of Manteca, Ripon and Escalon view each other from the points of a triangle; but they are really in spirit and community feeling, points upon an enclosing periphery of a circle of good feeling and sympathetic interest, and their joint agreement to rule out the dollar and all its offspring from association with their neighborhood joy and satisfaction is proof that there is one place, at least in California which does not carry its heart in its pocket. The State will surely be the better for what farmers are doing for themselves at this year's fairs, and their less reliance upon more professional promotive agencies.

HELP FOR THE HUNGRY.

AS OUR producing year begins anew, it is important to remember that California may have more to do than usual during the next few months in piecing out some products which the Eastern States have not gathered in usual abundance this year. The general condition, as made out September 1 by Orange Judd Farmer, is shown by contrasting acre yields in bushels this year and last, as follows:

	Yield 1915	Yield 1916
Corn	29.4	24.1
Winter Wheat	17.0	13.6
Spring Wheat	18.2	8.2
Oats	37.6	30.2
Barley	31.6	23.2
Potatoes	102.7	91.0

We choose the acre yields rather than the billions and millions of total crop because it seems easier to grasp the difference in that way. Any one can figure the percentage of decrease in each crop if that contrast appeals to him as more intelligible. The conclusion must be that production is notably short in all these crops and proportionally the same in other lines of food products, such as pasturage products, field vegetables, etc. It means not only reduced food-product exports, but high prices for both human food and animal feeds and forage.

Of course, we cannot do much for the East in grains, because California is now a wheat, corn, and oat buyer. We can help with barley, which is about our only export cereal nowadays, but Eastern people will drink what they can get of that, and not eat it. And we shall buy back some of that barley in the imported beers which are now being flamboyantly advertised in this State. But we can do something to advantage in beans, rice, and winter-shipped field vegetables, as well as helping out with large quantities of cured fruits of all kinds. It looks as though we could dispose profitably of all the potatoes we can get out of the ground during the first half of 1917: the Eastern potato crop is reported small—from forty to fifty million bushels less than last year. And Californians, who know how to grow winter cabbage, and have a good place for it, should notice that it is figured that there will be, east of the Rocky Mountains, from one-half to two-thirds of a full normal crop, and cabbage is selling now at \$18 to \$20 per ton, with \$30 anticipated. Certainly the wide-awake Californian stands a chance to make some money out of one bunch of hypphenated Americans if he can get a crop of winter cabbage by going right to work at it. The Eastern sauerkraut value of the California autumnal springtime may seem to some people more moving than poetry.

A MORE FRAGRANT OPENING.

BUT it seems as though California had a more urgent call to help the country with onions than with sauerkraut. Certainly the call has come sooner, for onions have been going East continuously since the harvesting of the main crop along the rivers began. This has been largely due to the fact that California can sack dry onions earlier than other parts of the country, and there have been years in which shippers have stored supplies for advance, and held them too long because other States brought in late crops beyond expectation. And yet, with the character of the Eastern summer this year, and the effect it has had on cabbage, as just noted, it is likely that we shall have an opening for onions at the East next spring, or as soon as we can get our earliest crop of dry

onions from the earliest regions. Therefore, the onion is another thing for growers of winter crops to bear in mind. Current gossip is that when the first onions came in this summer a crop of not less than 4000 carloads was expected, but after harvesting it is found that the total falls more than 1000 carloads. It is estimated that close to 2000 carloads have been shipped, which leaves only 1000 carloads for California consumption, and all of this amount is said to be in dealers' hands. Growers are believed to have sold out and a coming price above \$2 per ctn. is looked for by holders of the balance of the stock. And so it looks as though California might find it very profitable to have more onions ready as early as possible in 1917 to help piece out a probable shortage both at home and in the East.

HELPLESSNESS AND RICE.

OF COURSE we do not mean that any Americans are going to be actually hungry—even for onions and sauerkraut. The country is too large and varied in its productions for that. The only thing we mean by hungry is less cheaply fed, and that will not matter so much considering the widely distributed wealth-winning of the last two years. But it is the traditional luck of the farmer to have less to sell when the price is high and some hard-hearted economists are inclined to claim that the price is high for that reason—which is a cruel effort to rob the farmer of the enjoyment of hard luck which properly belongs to him, because a short crop always costs relatively more to produce than a large one. But this does not seem to be very close to the helplessness of rice.

It is possible that if other cereals are high the American people will take more largely to rice cakes, rice puddings full of California raisins, and other bread-substitutes of rice which California is now preparing to present as attractively as possible to the American imagination. Those who do not think much about it, may wonder why the California rice growers are blowing so much chaff into the public eye through the daily papers about their co-operative marketing organization. They may say: is not rice a cereal like other grains which grow on grass-like plants, why then not throw it into the grain trade of the country and not make so much about it—as though it were a prune, a raisin or an orange? The fact is, of course, that rice in this country is not like a common grain and cannot be turned into food form at the cross-roads' mills, as other grains may be, and common grain dealers are not ready to handle it. Of course they could learn to handle it and make the growers pay well for their education too. And then no one but a rice-miller has any use for "paddy rice" as it comes from the field—though why it should be given this Irish name when it belongs to a Chink, we will not stop to explain. The great fact, however, is that the rice growers of California who have the outlook for a crop of over four million bushels this year, have organized to help each other meet the problems of marketing a new crop and do not propose to have themselves individually and their products beaten about by conflicting interests until these interests get all the profit there is in feeding rice-eaters. The California rice growers are starting in strongly with a new product and they are wise in trying to mark out straight lines for the distribution of it. The high prices of other cereals this year will be no disadvantage to them in their important undertaking.

RICE IN ROTATION.

SOME one the other day, speaking of the place of rice in a crop rotation, remarked: "It is probable that on land which will produce other crops rice will be grown only in an occasional rotation, and for the purpose of clearing the land of weeds." In the interest of accuracy it must be said that the main reason for rotation in rice growing is because other crops may clean the land which rice-growing befools. Keeping a shallow flood on the land for about three months induces the growth of semi-aquatic plants which have the power to practically dispossess the rice to the point of unprofitability. The recourse to rotation is to clean the land for rice not by rice. And we are not sure that it may not be also desirable to resort to rotation to clear the air of mosquitoes. One might fairly prophesy that plowing under in the fall the

rank carpet of water-grass, etc., which the flooding induces, would mellow and restore humus, which our hard valley soils often greatly need, to such an extent that the grain yields of pioneer days would be repeated; also that a year's return to dry farming in our interior climate would clean the land for renewed service in rice growing.

WATCH FIRES A LITTLE LONGER!

UNTIL the rains really soak things it is the duty of everyone to guard against field and forest fires. We have had several conflagrations which have caused great public concern and perhaps created too great impression that this was a year of unusual disaster. It is therefore comforting to learn from U. S. District Forester Du Bois of this city that the fire situation in the national forests has been held well in hand, though for the State as a whole the season has been a severe one. Since the beginning of the year, 888 fires, burning over a total of 55,861 acres, have

been reported by the forest officers as against 731, burning over 22,086 acres, for the same period of 1915. Of the fires this season to date, lightning caused 294; railroads and lumbering operations 82; the camper's fires increased from 189 of last year to 223 for this season to date. This is a small increase, considering that travel in the forests has been four times greater than last year. The average camper is showing greater care with fire than ever before. There is decrease of incendiary fires from 104 last year to 83 this season to date: thought to be due largely to co-operation between the forest service and mountain settlers in the burning of brush areas. Of the 888 fires for the season in the national forests, 416 have burned over less than a quarter of an acre each, 280 less than 10 acres, and 183 over 10 acres. The largest fire occurred on the Big Sur in the Monterey forest where almost 10,000 acres were swept over. A fire of 8,000 acres occurred on the California national forest. Both fires are attributed to the carelessness of hunters or campers.

As between the plants you name we doubt if you can improve in speed of either green feed or dry grain by changing from barley. Both Canada peas and horse beans will stand frost, but we never saw them grow faster than barley under usual winter temperatures. They are apt to slow down faster than barley under dry, cool conditions. Under warm, moist winter conditions they will make much more green feed than barley, and be much richer for growing pigs, but they would not serve you so well as barley to be hogged off as a ripe grain. These legumes can be either broadcasted or drill-sown as soon as the ground is moist deep enough to keep them growing.

It is a question as to how far you should try to go in substituting these plants one for the other. They serve different purposes, and it would be good for the hog if you could get a good growth of all of them.

Escaping Tomato Blight.

To the Editor: I wish to plant tomatoes upon land which I used for tomatoes until the blight got into it. I have grown other crops on the land now for three years. Would it be safe to replant tomatoes now? How long does it require to rid the land of tomato blight? I am anxious to use this side hill as it is frostless and we get very early tomatoes. Is there anything I can use to rid or clean up the land from this blight?—C. E., Goleta.

Three years has probably cleaned the land so far as rotation can do it—providing the three crops were of plants not subject to the trouble and therefore unable to maintain the germs thereof. Therefore you would be justified in replanting tomatoes with good anticipations. You do not describe the action of the blight and do not give us any clue to which of several blights destroyed your crop, but from what we can infer from the season of the year at which you would be trying to get an early crop, we judge you have to deal with the "winter blight" which appears during the rainy season and may destroy an entire crop. But you can check it and save the crop if you start in spraying with Bordeaux as soon as you see black spots appearing on the plants.

Trees for Chicken Yards.

To the Editor: Will you name some quick growing trees to plant in chicken yards for shade? How are the fig and elderberry for quick growth? I want to plant a number of different kinds this fall.—L. K., Florin.

We should not count the elderberry much of a tree, but rather a rangy shrub making, naturally, clumps of many stems and not much spread of shade. The California native elderberry is rather more tree-like and can be trained to a single stem, but it would be more trouble to do it than the result would be worth. If you want a thicker, elderberries planted six feet apart each way would make it. But we should prefer something more tree like. The fig makes a grand shade tree but it is not so quick about it usually as the apricot. Another good tree, bearing fruit for chickens, is the mulberry. Both white and black mulberries are good. If you do not care for the fruit, the California large-leaved maple and the black locust are very handsome and very fast, if they get water enough. If you wish quite a collection of trees, the best way to determine which do well under your conditions is to study the dooryards of the older residents. Some of the evergreens, eucalyptus, acacias, etc., are very rapid, but deciduous trees are better for chickenyards, which should be as dry as possible during the rainy season.

Not Ripe Enough for Raisins.

To the Editor: I send a sample of raisins: what ails them? They were dried without being dipped.—L. B., Live Oak.

They were probably made from grapes picked before development of enough sugar in the juice.

California Weather Record.

The following rainfall and temperature record is furnished the PACIFIC RURAL PRESS by the United States Department of Agriculture Weather Bureau, at San Francisco, for the week ending at 5 p. m., September 19, 1916.

STATIONS	Past Week	Rainfall Data		Temperature Data	
		Seasonal To Date	Normal To Date	Max'm	Min'm
Eureka	0	1.78	.75	66	46
Red Bluff	0	.68	.29	98	52
Sacramento	0	.07	.16	96	50
San Francisco	0	.33	.04	82	50
San Jose	0	.01	.19	92	44
Fresno	0	.08	.01	100	54
Independence	0	.22	.00	90	46
San Luis Obispo	0	.00	.17	96	48
Los Angeles	0	.00	.00	80	54
San Diego	0	.33	.00	74	56

QUERIES AND REPLIES

Inquirers Must
Give Full Name
and Address.

Make a Good Start with Bulbs.

To the Editor: I have a piece of land with eastern exposure against a white cement house. I thought this plot would make an excellent bulb bed. The soil is very friable and well drained. Will you kindly inform me when and what bulbs to plant to insure blossoms the whole year?—J. L., Eureka.

Considering your situation on the northern coast and so near the ocean, you may expect grand results with such soil, exposure and protection as you describe. In hotter, drier parts of the State, the conditions might be too trying for spring and summer flowering bulbs, though good for winter bloomers. It is impossible in this space to discuss all the bulbs which should enter into such a long succession as you desire. Our book "California Garden-Flowers," has a detailed chapter on the subject and the special "bulb catalogues" of leading California bulb growers should be carefully studied, for they offer the bulbs at reasonable prices and give many valuable hints on the treatment of them. Send for the bulb catalogues as soon as you see them offered in our advertising columns.

It is now just the right time of the year to proceed with your planting. To begin in the fall and work forward is most promising. To begin in the spring is to lose practically the whole beautiful display of California winter bloomers, and to have only a short run of summer and fall flowering bulbs, with which no Californian should be content.

Guayule Not Yet for Cropping.

To the Editor: I have lately read of the cultivation of the Mexican rubber plant, guayule, being undertaken in the vicinity of Hemet. Do you think it likely the plant could be cultivated profitably in Antelope Valley, in the Mojave region?—C. J. M., Lancaster.

Though the plant "guayule" (*Parthenium argentatum*) has been under scientific study for several years and though its natural growth in the Chihuahuan desert has been quite widely used by rubber manufacturers, it is still a long way from suitable for planting as a crop. Nothing short of actual trial under your conditions will demonstrate whether you can successfully grow it. It may be interesting to try, as they are reported to be doing at Hemet, but no one should give time or land to it who needs speed and surety of actual returns. It is proper for institutional trial, as is now in progress at the Arizona experiment station, and practical planters should wait until the requirements of the plant are more clearly established. It has been shown that it will grow with very little rainfall; also that if one tries to speed up the plant with much irrigation or rainfall, he will get more growth and less gum—perhaps not enough to make it worth working. The slow natural growth, up to the profitable size of the shrub for working with a large percentage of gum, is estimated to require ten years. The plant is hard to start—only about 17 per cent of the seed coming under the best planned system of propagation, and it requires great care in transplanting. And

then, the plant is quite subject to depredations. In one experiment in Arizona, the jack rabbits ate down and killed the plants so in new places experimental plots have to be fenced and that would probably have to be done with crops until enough of it could be spared to feed the local population of jacks—which, perhaps, are few in the desert where the plant grows naturally. We do not advise anyone to think much of the guayule at present, except in an experimental way.

Practice Before Purchase.

To the Editor: I am at present a clerk with not very much knowledge concerning farming. Before buying any land or equipment I intend to work for a practical rancher for at least six months. Is that a good plan?—E. G., Los Angeles.

It is a very good plan, and will give you a chance to see how you like the real thing before blowing your money into something which may make you very homesick for counter-jumping. Some city people get wild about farming before they have any real knowledge of what it is and what it requires, and rewards. But of course you must remember that practical farmers, as individuals, are just like other people. You may go to work for a pessimist who can send the shivers down your back every time he opens his mouth; or you may hire out to an optimist who will make your head go light with his dreams of what he would do, if he had the money for it. As the poet says, such a man "never is, but always to be, blest." Try to hook up with a man who does a lot of his own work; who has a prompt, business-like manner as he works; who has a neat patch on the knees, but not on the seat, of his overalls, to show that his wife is onto her job of keeping him busy, and whose farm and farmstead show that he is wide-awake, and thrifty, and believes he is doing something worth while. If you find such a man, never mind about the wages; you will make more out of your half-year than he can.

Natural Cover Crop.

To the Editor: Is it necessary to plant cover crops in a pear orchard where a heavy green crop of wild oats, alfalfa, bur clover and weeds spring up voluntarily after the winter rains?—D., Wheatland.

It is not necessary, if the natural growth you describe is really heavy—that is, about as heavy as you can plow in. When it gets less than that, spread some stable manure in the fall, and get freer growth and more seed into the ground. If you have no stable manure, sow a cover crop. It is simply a question of getting under ground as much green stuff as you can and making that leguminous when you can.

Early Feed for Hogs.

To the Editor: I have been sowing barley for early hog feed, hogging it off in May. I would like to know if horse beans or Canada peas will make earlier feeds, and if there is any advantage in the substitution. When should they be sown and how?—R. S., Hanford.

Pruning Young Apricots.

To the Editor: There is a difference of opinion and practice as to the better method of pruning young apricot trees in this valley. The customary method is to cut back the main limbs each year for three or four years.

The other method is to allow the tree to grow from the time it is planted for four or five years, other than cutting off unnecessary limbs—keeping the tree symmetrical—keeping the center open.

The objections to the first method are: (1) By cutting back the limb, dead wood is formed at the point of cutting, weakening the limb. (2) It is contrary to the nature of the tree to cut off so much growth when the tree is young. Those who practice the second method claim that the tree is more vigorous and begins to bear earlier, and continues to increase. The limbs are stronger to sustain fruit. The tree is longer lived, etc., meaning that the tree is better in every respect by following the second method. Has it been demonstrated, absolutely, that one or the other is the better method?—A. W. T., Hemet.

[Nothing but death and taxes have been demonstrated "absolutely" and everywhere, because conditions dif-

fer. It is the general opinion that cutting back young trees induces them to become stockier and therefore stronger. The wounds on young trees trained reasonably open from the start, will not weaken the tree as a rule. So far as being contrary to Nature is concerned, very few of your objectors would care to eat the fruit of orchards cared for by Nature, and they wouldn't get enough of it to sell if they liked it. Modern commercial orcharding is necessarily artificial, and the fruits thereof are most pleasing.

On the other hand, we are not so sure much cutting back of young trees makes them appreciably stockier than they would grow if kept balanced and thinned out to make best growth.

With apricots, if you want early bearing, do not prune back the switches below the point where they branch out into a spray. If you think you will get enough better tree to pay for prevention of early bearing, the way is indicated.

LATE-PICKED RAISINS BEST.

[Written for Pacific Rural Press.]

Raisin picking is in full blast in Fresno county, but why the rush? Is there any more danger from rain late in September or early in October than now? G. M. Flint of Fresno county says that raisins must lie 10 days on the trays before rain will hurt them. If that is so, it might be better to delay picking as he did in 1915 until mid-September. The grapes would then contain more sugar, and make heavier, better raisins, of better color. More of the second crop could then be picked at the same time.

Our weather records for Fresno show that in no case, back to and including 1912, has there been even a trace of rain after the week ending Sept. 23 until after the second week in October.

In 1912, the only rain recorded is 0.1 inch in the week ending Sept. 3. In 1913, there was a trace in each of the weeks ending Sept. 2, 16, and 23. In 1914, there was .02 inch in week ending Sept. 22 and .18 during the following week. In 1915, there was a trace in the week ending Sept. 7.

In none of these four years was any rain reported in the first weeks of October.

People used to pick as soon as grapes would make raisins at all, because the early raisins were the only ones that sold for cost of production. The habit seems to remain, though the cause for it has been interred.

FUNGUS CAUSE OF ORANGE JUNE DROP.

The mysterious cause of "June Drop" of navel oranges is now believed by the University of California to have been found. That a fungus of the genus *Alternaria* is the cause is the theory advanced in the September issue of the University of California Journal of Agriculture by J. Eliot Coit, Professor of Citriculture, and R. W. Hodgson, a graduate this year of the College of Agriculture. The infection occurs in the blossom end. It is more serious in

the interior districts than in the coast regions because in regions of heat and low humidity the extreme transpiration of moisture by the foliage brings about a daily reversal of the sap current, which sucks the poison produced by the fungus back through the joint in the stem, causing it to weaken and break. It is now suspected also that this same fungus is responsible for a considerable proportion of the "splits" occurring in the interior valleys.

Having found a probable cause, the University is now carrying on experiments in the hope of finding a means of controlling the "June Drop" through prevention and control of the infection of navel oranges by the *Alternaria* fungus.

GROWTH OF CITRUS EXCHANGE 1915-16.

[By G. Harold Powell.]

The movement of California shippers towards the Exchange during the past year has been the largest in recent years. The combined efforts of the Field Department, the local Associations and the District Exchanges in giving growers a more complete understanding of the Exchange system, have brought into the Exchange fourteen shippers who formerly marketed through other channels, and nine newly formed associations. In addition, individual growers representing 4,379 acres and more than 1,560 cars of fruit have joined and shipped through established associations.

For the coming season four shippers (not included in the above data) who formerly marketed through other channels have joined the Exchange, and individual growers representing 1,600 acres of fruit have recently become members of the organization.

PEACH BLIGHT AND SHOTHOLE OF APRICOTS.

[Written for Pacific Rural Press.]

Shothole of apricots and blight of peaches are the same thing. They are unnecessary. They caused untold damage and many inquiries to this office last season, when it was too late to remedy the trouble.

This disease must be sprayed with a fungicide, usually Bordeaux in November and again with Bordeaux or lime-sulphur in spring when leaves open. Spraying is too late to be effective even after Dec. 1.

The disease is a fungus which makes shotholes in the leaves, dark, scabby spots on the fruit, and deadened spots on the twigs, doing its special damage around peach buds which ooze gum in spring after infection, and die.

Its presence on cannery fruit requires that fruit to be thrown out, as remarked by W. C. Huston of

Sutter county.

The shothole scabs go so deep that the lye process of peeling does not remove them. Mr. Huston says that a man cannot pick and sort a ton a day of Tuscan. The expense of sorting, the loss of fruit buds, and of the fruit which does mature, are a high price to pay for negligence in fall spraying. We will have more to say about this later if our subscribers desire it.

There is more time for pruning lessons now than when pruning begins. How do your neighbors do it?

ANY STRONG MAN can squeeze out enough money to invest in that which will bring back dollars in his right hand.

NEW AND OLD WORLDS."

BY PAUL B. POPENOE.

The author has studied the DATE GROWING INDUSTRY where it has flourished for centuries—in Northern Africa and Arabia. He has also studied it in California and Arizona, and shows there are sections in these States where certain varieties of dates may be much more commercially grown than now and with great profit.

Winter Sunburn Whitewash.

[Written for Pacific Rural Press.]

Sunburn of young fruit trees is not due so much to heat as to excessive drying out, which may be due to excessive heat or to lack of adequate moisture. If plenty of moisture could be supplied from within the trees, to the parts that are sunburning, there would be little damage. To these facts is due at least some of the winter sunburning of trees newly set out. The damage may not be noticeable to the passerby; but close inspection may show the possibility of sap flow greatly restricted by sunburn-damage to the bark.

Winter sunburn may often occur when hot dry days dry out small tree trunks, during dormancy of the roots when they are unable to supply needed moisture. The same is true of new plantings until roots

have become established. To prevent it, tree protectors are used or whitewash is applied.

To forestall many inquiries for whitewash recipes, we reprint one mentioned in our "Second Thousand Questions in California Agriculture" as being specially durable.

- (1) Quick lime62 pounds
Water (hot)12 gallons
- (2) Common salt 2 pounds
Sulphate of zinc ... 1 pound
Water (boiling) ... 2 gallons
- (3) Skimmed milk 2 gallons

Slake the lime thoroughly in (1); dissolve the salt and sulphate of zinc in two gallons of water (2); pour (2) into (1) and add (3). Mix thoroughly. Two pounds of flour paste (dissolved in two gallons of hot water) may be added instead of the skimmed milk.

FIRST COMMERCIAL SHIPMENT OF TEHACHAPI PEARS, SEPT. 9.

To the Editor: The first commercial shipment of Bartlett pears from the Tehachapi district was made Sept. 9. It went to Eastern markets.

These Bartlett pears come mainly from the orchard of B. M. Denison, a few being from the older trees of the Tehachapi Fruit and Land Company.

The work of sorting and packing the pears is being done by an experienced force brought here by and under the personal supervision of W. S. Killingsworth of the Pioneer Fruit Company.

Mr. Killingsworth says that he understands there are no other Bartletts on the market at this time that have not been in cold storage; because of this fact, the quality of the pears, and the lateness of the ripening season, the Tehachapi Valley Bartletts are in a class by themselves.

These first commercial shipments mark an eventful epoch in our development; this spring it was currants; now it is Bartlett pears; a little later the new commercial planting of winter varieties of apples will be in bearing. C. T. McKinnie. Tehachapi.

APPLE STORAGE HOUSE.

To the Editor: Where can I get information as to the layout and construction of an up-to-date apple shed with storage capacity for a 25-acre orchard?—D. F., San Francisco.

[Chas. King of Sonoma county, with an apple orchard two to 40 years old, has a cold storage house with a capacity of 7,500 boxes or more. In this he stores Bellflowers, Spitzenbergs, Newtowns, and Wagners for himself and a neighbor.

The building is 40x60 feet, has no refrigerating equipment, but is kept cool by night ventilation. Some of the Wagners and Newtowns are held as late as Apr. 15. The shrinkage by decay, etc., does not exceed two per cent.

The floor and sides are of sawdust held in place by board sheeting inside and out, 8 inches apart. The ceiling has two layers of sheeting and 14 inches of sawdust, above which is six feet of air space, then

the regular gabled roof. The air space helps shield the ceiling from the heat on the roof.

Along the peak of the roof is a low, open, continuous cupola. On each of two sides are seven doors about two feet square, built like the sides, and located just above the level of the floor. At night these are opened. A wire screen on each prevents exit or entrance of any codling moths or rodents.

The fruit is stacked in trays 22 inches square and 3 inches deep. Their bottoms are of eight lath so spaced that apples rest squarely on them. One lath on each side leaves plenty of chance for ventilation.

Trays are stacked 30 deep in piles so there is an aisle from each door to the one on the other side of the house. A gentle draft of cold air flows in at night while the warmer air flows up through the cupola.

At the end of the season, the house is closed tight and sulphur burned to kill any loose insects.

GRAPE COVER CROP AND FALL CULTIVATION.

To the Editor: Is sowing some kind of grain in fall or winter a good fertilizer for a vineyard? What kind of grain and how is it best to sow it, and how high shall it be grown to make a good fertilizer? Would it be a good idea to work the land up after the first good rain in fall to give the rains in winter a better chance to settle in the ground and would it help the ground any?—J. P. G., Dinuba.

Why should you grow any kind of grain which adds no fertilizer, though it may help make some plant food more available to the vines, when a legume such as bur clover, melilotus, vetch, etc., will do as much or more good, besides adding a lot of nitrogen? We see no objection to fall plowing and cultivation except that it softens ground for pruning.

The Growers' Information Bureau takes exception to the prune production figures recently published by the Dried Fruit Ass'n. These figures claim, among other things, that in the past nine years 708,000 tons of prunes have been produced in California, which the Information Bureau contends are 119,500 tons in excess of the actual output. The variance cited is probably due to different methods of arriving at the total estimate rather than to any deliberate intention to mislead the public.

Don't Lose Your Only Chance

International Harvester Tillage Implements

IT takes more time, and more work, to disk, plow and harrow until you have a furrow slice mellow and moist from top to bottom, and compact throughout. But it pays to do it right.

For many crops, the only chance you have to insure good growing conditions is when you are preparing the seed bed. A well-prepared seed bed is always one of the best guarantees of a good crop at harvest time.

The preparation of good seed beds is important enough to warrant care in the selection and purchase of tillage implements. It will pay you, before you buy, to look over carefully the full line of International Harvester tillage implements sold by your local dealers.

Note the unusual strength of the disk harrow frames. Ask the dealer to show you how the adjustable snubbing block and bowed set-lever bars hold the gangs level. See how carefully the oiling system is designed.

See your local dealer and go over the machines with him, or write us for catalogues and information, but don't buy a disk harrow, spring-tooth or peg-tooth harrow, or cultivator this spring until you have seen the IHC tillage line.

Three Hundred Million Bushel Crop in 1915

Farmers pay for their land with one year's crop and prosperity was never so great.

Regarding Western Canada as a grain producer, a prominent business man says: "Canada's position today is sounder than ever. There is more wheat, more oats, more grain for feed, 20% more cattle than last year and more hogs. The war market in Europe needs our surplus. As for the wheat crop, it is marvelous and a monument of strength for business confidence to build upon, exceeding the most optimistic predictions."

Wheat averaged in 1915 over 25 bushels per acre
Oats averaged in 1915 over 45 bushels per acre
Barley averaged in 1915 over 40 bushels per acre

Prices are high, markets convenient, excellent land low in price either improved or otherwise, ranging from \$12 to \$30 per acre. Free homestead lands are plentiful and not far from railway lines and convenient to good schools and churches. The climate is healthful. There is no war tax on land, nor is there any conscription. For complete information as to best locations for settlement, reduced railroad rates and descriptive illustrated pamphlet, address

Superintendent of Immigration, Ottawa, Canada, or apply to Gilbert Roche, Canadian Government Agent, Canadian Bldg., Exhibition Grounds, San Diego, Cal.

Are We Ready for New Zealand Flax?

[Written for Pacific Rural Press.]

The plant commonly known as "New Zealand Flax," (Phormium tenax) as a flag-like plant which has for years been grown in California as a garden ornament. It is vigorous of growth, tenacious of life, will stand considerable drought, and some alkali. It is a perennial and once established will endure and yield crops for many years.

The long, flag-like leaves are of a grayish green color; they will average 2 1/4 inches wide and 4 feet long, and consist of a mass of extremely strong fibers, the fibers being the full length of the leaves and small fibers stripped from a green leaf are stronger than equal size of good cotton thread. This plant, while it will grow in a comparatively dry soil and while it will stand a lot of drought, yet requires water to be developed profitably, and the plant doesn't care how much water you give it, in fact it just revels in an abundance of it and will grow like taxes, in a waterlogged soil and hasn't any objections to being occasionally overflowed.

The value of the plant is in the fiber only. In New Zealand enormous quantities are raised and one

of the chief exports of that country is the rope fiber, all of which comes from this plant. In our country not only is there an immense market for the fiber but a gigantic market is before us at all paper mills. Our paper mills are now paying from three to four cents per pound for old rope and old rags; the fiber of the flax does not need to be extracted for use in a paper mill. All that is necessary is to cut, wilt and dry the leaves the same as if it was hay, for, when thoroughly dried, the fiber contents of the leaves are over 90 per cent of the whole.

This plant, it is estimated, will yield two tons of dried leaves or unextracted fiber per acre per year, and the expense of handling the crop is very small, because once planted the only expense is mowing, raking, stacking and baling. In New Zealand as far as can be ascertained no cultivation is done at any time, the plants simply growing wild and covering the entire ground.

A better crop for the delta lands could hardly be hoped for, the use of paper is constantly increasing and the dearest ingredient used in paper making is fiber. No matter how cheap a grade of paper is made from wood pulp or anything else, some fiber must be used and the better and stronger the paper, the more fiber is required, so that an unlimited market is ahead of anyone raising fibrous material. Rags suitable for paper making have never sold here for less than \$15 per ton, and it is unlikely that this low price will ever be reached again. Therefore a crop that costs to raise less than hay, and that raises more tons per acre than grain hay and that once established never needs replanting, ought to be an ideal crop. Anyone owning wet land should give this New Zealand flax a trial. The writer believes that if fairly tried out, that in a few years all the low lands of our deltas now used only as pastures will be solid fields of fiber flax plants.

The plants are raised either from seeds or from root divisions. Seeds and roots can be obtained from any seedstore or nursery. There is no monopoly on these articles and no exorbitant prices to pay. This is not some new marvel just developed and being put on the market by some wizard of the vegetable kingdom, but an old and well-known plant, used for years in the Australian islands as a fiber producer and grown here in California in our gardens as an ornament. We just simply have never thought before of using it as a crop, and now that we have thought of it, let us make ourselves the great paper State of the United States. We have now several factories here which are at a loss to get fiber; amongst these being the Pioneer Roofing Material Co. of Los Angeles, The Paraffine Paint Co. of Emeryville and a new large plant being now erected in Richmond by the F. W. Bird Co.

The powder companies purchase great quantities of cotton fiber for use in making gun cotton and nitrocellulose; they could use this fiber instead. So another field is open to us; in fact the uses to which this fiber could be placed are endless.

What is wanted is for the farmer to start right in and raise it. We have the climate, the soil, the wet land and the market. A. W. S. Oakland.

[The suggestion is timely. But it is not wholly up to the farmer. He cannot put his land into anything on the prospect that some one may buy it. It is the duty of the manufacturers to test the product

and, if satisfactory, offer contracts to growers. Plenty can now be had to make such tests, as our correspondent intimates. The plant was grown in considerable quantity by the University of California thirty years ago and proposed for trial as a local fiber product, but at that time there was no such demand for fiber as there now seems to be.—Editor.]

The Alameda County Fair.

[Written for Pacific Rural Press.]

Affording unusual opportunities for the city visitor as well as the farmer, the Alameda County Fair held at Pleasanton is always assured a large attendance, and as large attendances attract exhibitors, one can always expect to see a representative county fair at Pleasanton.

Horticultural and agricultural exhibits this year were largely made by the various Farm Centers of the Alameda County Farm Bureau. As is always the case when farmers show their own products these exhibits were highly representative of the agricultural and horticultural resources of the district. As might be expected there was an abundance of the fresh product in these dis-

plays and a satisfying lack of the bewhiskered, glass-enclosed monstrosity so frequently used by the professional showman.

Poultry this year comprised an important part of the show, being judged both from a fancy and utility standpoint. It is but natural that a district so closely identified with commercial poultry raising should have a poultry show that in quality stood second to none.

Although several herds of cattle and hogs were absent because of car shortage, the livestock show was general in nature and of good quality.

The State Fair champion herd of Ayrshires was shown by the Steybrae

Stock Farm as was also the State Fair Grand Champion Berkshire boar by H. L. and E. H. Murphy. The same firm had the only exhibit of beef Shorthorns on the grounds. Milking Shorthorns were exhibited by Alexander and Kellogg and G. A. Murphy. Both Holsteins and Jerseys, in any quantity, were missing. Bishop Bros. were the only sheep exhibitors with their Shropshires.

A one-day's draft horse show was a feature during the week, as it allowed neighboring stallion owners to compete without losing an entire week's time.

BISULPHIDE GROUND SQUIRRELS.

To the Editor: I have been fighting ground squirrels for 25 years in California and have poisoned them by the hundred; but will say that there are places, conditions, and seasons when it is very hard to get

them with poison, and I have found that a sure way to get them is to use bisulphide of carbon or "quick oil."

First, I go around with pick and shovel and close up all the holes. Some holes might not have any squirrels. About two days later, I go around with the stuff in a bottle. I put as many old rags in a bucket as I can poke loosely into the hole, pour on them four or five tablespoonfuls of the oil, dump into the hole, poke with a stick far enough so that they will not be covered with dirt, and close the hole up, and tamp it down. Ready made balls can be bought to use instead of the rags.

The idea is to do the job as quickly as possible, as the liquid is soon evaporated and gone after leaving the bottle. It also seems to me that very early in the morning is the best time to do the job. U. S. Adams.

Modesto.

TO SELL HONEY, SEND SAMPLES.

To the Editor: In reply to your inquiry whether your readers want the honey market quotations continued, will say that I take the paper for the market reports and am a beekeeper and have a small orchard. Do you know a dealer to whom I can safely ship my honey?—W. H. B., Esparto.

[Answered by R. M. Tooker Co., S. F.]

[If this is strained honey, and can have a few small samples, we can easily sell it East provided there is enough to make a minimum 15 ton car. We might sell smaller lots of either strained or comb honey to California or to Pacific Coast buyers, at the market price, quality considered; we think new crop strained honey is worth anywhere from 5% to 6 1/2 cents—depending upon quality and color.

Will be very glad indeed if we can be of any service to any of your patrons, though ought to say that we would either want to charge them a brokerage as is customary, or might possibly be able to add to their prices to cover value of our selling service.]

CHEATING ORCHARD JACK-RABBITS.

[Written for Pacific Rural Press.]

Jackrabbits like young orchard trees in spite of protectors, etc. G. B. Abbott of Tehama county saves his from being girdled, though the new growth on almonds, pears, and prunes is so tasty that rabbits get it anyway. They do not seem to like peach buds.

Mr. Abbott shoots a rabbit, splits it, and rubs the inside of the carcass up the trunk of each tree. One rabbit will treat 10 acres and prevent gnawing of the bark for a month.

There will be open for settlement, from November 7 to December 4, 1916, about 140,564 acres of land withdrawn from the Monterey National Forest. These lands are in San Benito, Monterey, and Fresno counties, and are mainly good for pasturage only.

Mechanical Power on the Farm.

Users of tractors, engines, pumping plants, motor trucks, automobiles, electric motors, and other mechanical farm power are invited to make this department an exchange of your experiences and troubles.

PUMPING PLANT STAND PIPE.

To the Editor: I have a pumping plant consisting of a 25 h.p. gas engine and No. 7 centrifugal pump. Am forcing water through 1000 feet of 12-inch sewer pipe which elevates it 10 feet. Have had considerable bursted pipe which is probably due to vibrations of the gas engine. I wish to build a tower to prevent breakage of the pipe. What dimensions should it be?—F. S., Gilroy.

[Answered by Krogh Mfg. Co., S. F.]

We would understand that the party contemplates installation of an open top stand pipe in connection with his pipe line, discharging from his pump into this stand pipe, the water flowing from the stand pipe into the pipe line. He does not state what capacity he is obtaining from his 7-inch centrifugal pump. Assuming that he is obtaining the normal capacity, or 1200 gallons per minute, from this pump, the elevation plus the friction head will amount to 14½ feet; we assuming that this sewer pipe is accurately laid in line. If the joints are badly out of line, the friction head will be much more than mentioned above. Therefore, if a stand pipe 14½ feet high is installed the water would rise just to the top of same. We would recommend that the stand pipe be not less than 20 feet in height, and that it be 18 to 24 inches in diameter. The pump can discharge into this stand pipe at any height desired. The stand pipe should be left open on top and should be located outside of the pump house, as when the pump is shut down there may be surges in the line which will cause the water to surge over the top of the stand pipe; this being the primary object of using a stand pipe to permit the water to surge and relieve the pressure on the line. If the stand pipe is closed at the top, no particular benefit will be obtained from same, unless the stand pipe is used as an air chamber and is frequently charged with air.

It is our opinion that this pipe line is not breaking from the pulsations of the gasoline engine. We think if your inquirer will place pressure gauge on his pump, he will find that the variation in pressure due to the pulsations of gasoline engine are very slight. It is our opinion that this breakage is caused by water ram or hammer which takes place when the plant is shut down and the valve on the pump closes. The direction of the flow then reverses and when the valve closes a heavy waterhammer is produced which runs the pressure away up on the line. The use of a stand pipe will eliminate the water ram.

We wish to state that sewer pipe, which we understand is ordinary terra cotta soil pipe, is not intended to be used under any pressure at all. It is very brittle and has little tensile strength and is intended for drain pipe only.

STEEL AND MACHINERY PRICES.

[Written for Pacific Rural Press.]

The National Implement and Vehicle Ass'n appointed a committee some time ago to get a line on the

possibility of getting steel to make into farm implements at prices that would let them avoid raising the prices of implements and tractors. The committee reported that they were unable to get any concessions from the steel men for farm implements because the war demand was so strong for steel at prices "advanced 125 per cent base since purchases were made which entered into implements sold to the trade last spring."

The committee reported that farm implement prices had not kept pace with the prices of their raw material because manufacturers had hoped that steel prices would drop. This is now hopeless for a long time to come, and it is recommended that farm implement users or prospective users be told why the prices must come up; and the increased earning power of such implements be called to their attention. Though higher prices prevail for implements, they also prevail for the products of implement users; and no one can afford to be without machinery he needs, at this stage. He might possibly save some of the advanced price by waiting indefinitely, but meantime he would be losing the opportunity afforded by machinery to enlarge the production of his own higher-priced product.

HEADLIGHT DIMMERS.

[Written for Pacific Rural Press.]

Not enough automobile drivers have yet been arrested for blinding others coming from the opposite direction by omitting headlight dimmers. Some time ago we printed a note regarding Epsom salts dissolved in water. Some inquiry fails to reveal users, and A. S. Gardiner of Marin county writes that it flaked off from a bathroom window. Osen-McFarland of San Francisco use white enamel, but say white paint will work all right. It should be applied on the lower (not the upper) half of the glass, with a small semi-circle above the center, to come directly in front of the globe.

SILOS NEED ROOFS.

[Written for Pacific Rural Press.]

Although silo roofs have not been built on the majority of silos erected in this State because of the idea that the silage does not need protection in our mild winters, it is evident to anyone who gives the matter any thought that a roof is badly needed during the long summer season when the majority of silos are empty. We have recently seen the effects of this double sunning on a number of silos and in every case the damage done to the silo in one or two seasons would more than have paid for the small roof required.

Announcement is made that the New York State Department of Foods and Markets has signed contracts with farmers and dairymen owning 190,000 of the 250,000 cows supplying milk to New York City for the handling of their milk at cost during the coming year. This will add about one cent a gallon to the producers' income.

LAYNE & BOWLER PUMP

Satisfaction!

Says James Hughan, of Downey, Cal., under date of Dec. 16, 1915. Here is his letter: "Eight years ago I bought a 25 H. P. Commercial Engine and have been using it ever since. Am pleased to say it has given entire satisfaction and is running as well as when it was installed. Repairs have cost so little that it is not worth mentioning."

"Last summer I replaced my batteries with one of your Plugoscillator Magneto, and am more than pleased with it. No trouble to start and no trouble while running."

"Will say that I have had more satisfaction from the money spent with your company than any money I ever spent in my life."

That's what a practical man says of the

Commercial Engine

VENTURA COUNTY FAIR.

[Written for Pacific Rural Press.]
The attendance at the Ventura County Fair Sept. 13-16 was estimated at 12,000 to 15,000 and the show was the greatest ever.

The livestock was better than in the previous year, by the addition of swine, which were not shown last year on account of cholera. More than half the stock was horses, over 100 head being shown. Cattle, hogs and sheep were put into panel pens newly built. Durocs led the hogs with 18 or 20 head, Poland Chinas 13 head, and Berkshires 7. The most interesting exhibit was that of two litter mates, one fed by a High School agricultural club boy, the other by the farmer who bred them. One weighs close to 200 pounds, the other less than 100 as we guessed it. (More about this later.) Five sheep were shown. Eight Guernseys, including three heifers with first calves were the most striking. The Holstein exhibit of six was mostly bulls. Jerseys were represented by three females. A Hereford and two Shorthorns made the beef show. Horse races by local people with their own stock held first interest.

The agricultural exhibit is where the Fair made its greatest stride this year by nearly filling a tent 180x80 feet with varied and representative exhibits, mostly by Farm Bureau members. Last year agriculture was represented by three tables in one end of a tent. Indian corn lined the tent walls. Three tables held twenty exhibits of limas on the vines. The apple tables opened the eyes of even the natives and made a bigger exhibit than citrus fruits. The most beautiful lemon display ever noticed by the writer was of three trays, every lemon perfectly colored and of the same size as the rest. This was by the Rancho Sespe, who also included a chart and scales showing their system of individual tree records. A lot of really flaming giant Tokays drew exclamations from across the tent. There were two exhibits of the most varied crops from one farm. First prize was won with 57 varieties by Gwyn Thurmond, who was also superintendent of agricultural exhibits. Fourteen exhibits showed the transformation of beets into sugar and dried beet pulp.

The Holt, Yuba, and Samson tractor people demonstrated their machines, and the De Laval Supply Co. had a feed cutter run by one of their own engines.

The automobile and truck display outnumbered the Panama-Pacific and the State Fair, to say nothing of the equally interesting exhibit of farmers' automobiles parked everywhere about the grounds.

Poultry included a dozen breeds of fowl, many waterfowl, pigeons, and turkeys, besides noisy dogs and sleepy cats.

The Women's and Children's Building was well filled with a strong competition for prizes on all kinds of needle work, baking, canned fruit, pickles, candies, baked beans, flowers, manual training school work, painting, etc.

The attendance at the Humboldt Co. twentieth annual agricultural fair was the largest in the history of the county. The weather was ideal throughout the week.

General Agricultural Review.

FIELD CROPS.

Twenty-one tomato-canning factories in California report an aggregate acreage of 3,087 in that vegetable, as against 1,847 in 1915.

The American Beet Sugar company has just closed a 5-year lease on several thousand acres of the large Newhall ranch in the vicinity of Saugus.

The condition of the cotton crop in California at the end of August was 92 per cent of a 6-year average—about the same as last year (93 per cent).

W. G. DeCelle, rice culture expert for the Yolo Water and Power Co., has been named president of the corporation. He will maintain offices in San Francisco.

The best crop on the 700-acre Spreckels ranch, near Sargent, is being harvested, and the product shipped to the sugar factory near Salinas. The crop is good.

A. E. Miat, Secretary of the Tulare Co. Board of Trade, says a tract of 300 acres of alkali land of the worst kind situated south of Pixley, Tulare Co., will yield about 35 sacks of rice per acre.

The condition of the hop crop in California, on the basis of a ten-year average, is 95 per cent. The condition of the same crop throughout the United States, on the same average basis, is 88.4 per cent.

The field agent for the Sacramento Valley Sugar Co. at Hamilton is interviewing landowners in that vicinity relative to planting sugar beets this season. The company offers \$6 per ton at the loading place.

The laborers who were dismissed from the Butte Co. Hop Company's fields at Chico, on the grounds that they were not picking clean hops, and were making trouble, were replaced by a band of about 75 Indians.

Seed inspectors and others interested in determining the purity of Sudan grass seed may obtain a technical description of this method in Dept. Bulletin 406. "Distinguishing Characters of the Seeds of Sudan Grass and Johnson Grass."

The Pacific Coast potato crop for this year, according to Portland, Ore., market experts, will be 42,000,000 bushels, against 48,000,000 bushels in 1915. They claim the greatest loss both in acreage and condition is in California.

Shipments of beets from Owensmouth will reach 40,000 tons this season. The best beets bring \$8.50 per ton, the highest price yet realized. The sugar company pays the freight from anywhere in the valley without deduction on tonnage price.

Sixty per cent of all Ventura county squirrels are deceased because of the Farm Bureau squirrel campaign in which 28½ tons of poisoned grain has been distributed at about cost, 50c per gallon. As others are selling poisoned grain at \$1 per gallon, it is figured that \$6,000 has been saved to farmers in poison alone besides what would have been the squirrels' feed bill.

Damage to the country's cereal crops during August caused a loss of many millions of bushels in prospective production, cutting down the outlook for wheat to below the amount required for home consumption. The Dept. of Agriculture estimates the wheat crop as 611,000,000 bushels, or 9,000,000 bushels less than necessary for domestic use. A carry-over of approximately 160,000,000 bushels of old wheat from last year's record-breaking crop makes up the deficiency and leaves something like 100,000,000 bushels available to supply the foreign demand.

DECIDUOUS.

The Pasadena Canning Co. paid the growers of the Visalia-Farmersville-Exeter district for the 4,000

tons of peaches bought of them close to \$105,000, the biggest price ever secured by the growers of the district for a like tonnage.

An order for the eleventh car of peaches is reported by the Calif. Peach Growers for shipment to France.

Mountain View is to have a big prune and apricot celebration on October 4, with a view to advertising the locality.

The Ainsley Cannery in the Camp-

bell district, below San Jose, put up 70,000 cases of apricots, peaches, and pears this season.

The crop of French prunes in Tulare Co. is the heaviest and best in years, and the growers will realize handsome returns. A big price goes with the abundant crop.

The fruit standardization law will be made uniform throughout the State next year, according to J. Ralph Zion of the department of viticulture of the Univ. of California.

Horticultural Commissioner D. Moulton of San Francisco has positive opinions regarding the kind of fruit he will allow to be sold in this city. He says the "O. K." of the inspector must appear on every pack-

age of apples. Many carloads of inferior fruit have been turned back.

Owners of alkali land will be interested to know that 200 acres of land in Sutter Co., formerly considered worthless, will be soon producing peaches, plums, cherries, and apricots. An experiment was carried on at the Plant Introduction Gardens at Chico to ascertain whether a peach tree which thrives on alkali land in China would do equally well on alkali land in California. The roots grew into trees which produced good fruit. Scientifically the root brought from China is known as the Davidiana.

Kings Co. apricot and prune men endorsed the proposed Calif. Prune

Hudson Now Holds World's Greatest Hill-Climbing Record

Makes Fastest Time Up Pike's Peak

No hill-climb or mountain test in the world equals that imposed on motor cars that race to the summit of Pike's Peak. A Hudson Super-Six Special made the best time of more than 20 contestants to the top of America's most famous mountain, over the longest, steepest, highest travelable road in the world.

The start, at a mile and three-quarters above the sea, is higher by far than is the altitude of the finishing line in most hill-climbs.

The finishing point of Pike's Peak is almost two and three-quarters miles above sea level. In the twelve and a fraction miles of the course there are 60 turns, and the rise is almost one mile high. There is no place where the car is not climbing.

The high altitude affects the power efficiency of the motor and water boils at such low temperature that motors cannot be cooled as they are in lower levels.

Hudson Fastest Time

The Hudson climbed up this winding steep road to the "Top of the World" in 18 minutes, 24 seconds. Its time was 2½ minutes faster than the next fastest car.

This feat now gives to Hudson practically every worth-while record. In speed—when 102.3 miles an hour was attained at Daytona; in endurance—when 1819 miles were covered in 24 hours, with a stock Super-Six chassis we established marks not likely soon to be equalled.

Now we have added to these the greatest of all hill-climbing feats. In it we have shown the endurance of the Super-Six.

Others Failed

Motors of some of the most famous racing cars in the world were unable to withstand the strain of that climb and so did not get to the summit.

It is constant hard pulling all the way and more than three-quarters of the distance must be made in second speed, even with specially geared cars.

In addition to mere climbing, as is required in all hill-climbs, here is added the difficulties of carburetion and cooling.

The altitude that affects one's breathing so much that even the strongest man can stand only the least amount of physical exertion, has a similar effect in reducing the power of the motor.

We made that record in a contest in which were entered, as described by a Denver newspaper, "Fours—Sixes—Eights—Twelves and Super-Sixes."

And, as in all tests in which they have been entered, the best performance was shown by the Super-Six.

HUDSON MOTOR CAR COMPANY, DETROIT, MICH.

& Apricot Association, following an address by Colonel Weinstock, who outlined the purposes of the proposed organization. It is estimated that there are 124,000 bearing apricot and 132,000 bearing prune trees in Kings Co.

The Sebastopol Berry Growers, Inc., have launched on the market a new beverage called Loganberry nectar. It is claimed to "please the palate, tickle the throat, quench the thirst, agree with the stomach, and tone up the system, all without woozy feeling or woolly taste in the morning." It must be great!

CITRUS, OLIVE, SEMI-TROPICAL.

Recently H. E. Brooks of Oak Flat sold a load of this year's crop of almonds valued at \$1,000.

The opening of the olive packing season is near at hand in Porterville, which has an enviable reputation for high-grade olives.

An agricultural school in connection with the Citrus Experiment Station of the University of California is contemplated at Riverside.

A solid trainload of walnuts is to leave Los Angeles the end of this week, to consist of 25 cars, having an estimated value of \$100,000.

The harvesting of the Oroville fig crop, which is now well under way, is reported to be heavy, with good prices prevailing. There is said to be an increased use of figs in confections.

The Calif. Walnut Growers' Association estimates this season's crop of nuts at 12,150 tons, after taking much pains to secure an accurate forecast. Opening prices on the "Diamond Brand" were announced Wednesday of this week. (?)

G. P. Rixford, special government expert on figs, dates, and nuts for California, while in our office recently, stated that the fig crop of California this year was estimated at 5,000 to 6,000 tons of all varieties. From 1,500 to 2,000 tons of these are Smyrnas, for which the growers were receiving from 9½ to 10 cents per pound in sacks dried.

The first processing of walnuts at the Goleta walnut house by the new drum processor instead of by the old tank system has been tried. Definite results will not be known for a week or two. By the new process the hot bleach is shot over the walnuts in the drum instead of allowing the nuts to soak in a tank.

At the annual meeting of the Lindsay-Merriman Citrus Exchange, held on the 11th inst., it was shown that the Exchange had signed up over 2000 acres of new business during the year, comprising the following: Orange Cove Citrus Ass'n, Orange Cove, Fresno County Elderwood Packing House Co. in the Woodlake District, Lindsay District Orange Co. and the Hersey Groves at Lindsay, also the Lancashire-Harris groves at Naranjo, with new houses and the latest equipment it is in splendid shape to care for its members.

The president of the Coachella Valley Date Growers Association says: "There is one seedling garden in the valley five years old, consisting of 20 acres. A few of the earlier varieties are now beginning to ripen, but the high-grade dates will not be ripe for from 30 to 60 days. They are selling at from 30 cents to \$1 per pound. One Deglet Noor palm 12 years old, has 20 bunch of dates, averaging at least 35 pound per bunch. This palm and its sister tree during 1915 brought \$309.30 to its owner. Five palms four years old changed hands last month at \$40 each."

Confirmation of orders booked previous to the naming of prices by the California Almond Growers' Exchange came in so fast following the naming of opening prices that within a few hours the exchange discovered that practically the entire crop had been sold. A meeting of the directors was called and it was decided to raise the quotation for all grades 1 cent. Prices in effect under the new schedule are as follows: Non-

pareil, 20½c; I. X. L., 18c; Ne Plus, 17c; Drakes, 16c, and Languedoc, 16c. It is estimated that the exchange will handle approximately \$1,000,000 in almonds this year.

GRAPES.

The raisin crop in the Wasco district will reach 1,000 tons, valued at from \$60,000 to \$70,000, according to A. J. McCombs.

A Kerman vineyard of 50 acres of Malagas has just sold for \$12,500. The purchaser is G. M. Virgin and the seller Dr. R. D. Alway.

The Thompson Seedless raisin grape crop will be 8,000 to 10,000 tons greater than last year, according to announcement made by the

California Associated Raisin Co. The 1915 crop was about 18,000 tons of Thompsons and approximately 8,000 tons of Sultanas.

The directors of the Chamber of Commerce, Sacramento, have sanctioned a plan to secure a farm adviser for Sacramento county.

Raisin shipments by rail for August, 1916, amounted to 14,186 tons, according to an announcement made at the offices of the California Raisin Co.

One of J. A. Schlueter's Thompson Seedless pickers near Kerman got seven trays from his first two vines, and "guessed maybe he'd get to the end of the row around Christmas time."

MISCELLANEOUS.

Generally speaking, California fruit and nut growers are enjoying exceptional prosperity this year. Prices on all lines are on a high plane.

PERUVIAN ALFALFA SEED

Guaranteed to be genuine. My fields were planted from seed recommended by the U. S. Experimental Station at Indio, Calif. Guaranteed to be free from dodder and Johnson grass. Acclimated perfectly to arid districts. Prices on application. Any amount up to three tons.

A. H. SMITH,

INDIO,

CALIFORNIA.

There Are Dollars In Your Subsoil. Get Them Out!

The value of your land can be greatly increased by means of subsoiling. Beneath the surface soil of your fields, which has been thoroughly stirred by your plow and kept fertile by the rotation of crops, there lies a subsoil that you have never touched.

This subsoil is probably either one of two things—rich soil of which you should be getting the benefit, or a hardpan which is obstructing drainage, deforming the roots of plants and trees, and in other ways lessening the value of your land. In either case it should be broken up by means of

HERCULES DYNAMITE

If the underlying soil is fertile and rich so much the better. Subsoiling with Hercules Dynamite will stir it up, bring part of it to the surface where it will be at the disposal of your crops, loosen it so that the roots can penetrate it easily and get out of it all the good there is in it.

On the other hand, if the subsoil be a hard, impervious layer beneath the cultivated soil it is imperative that it be broken up in order to facilitate drainage, give roots a chance to spread naturally, and get out of it the mineral food it contains.

By means of subsoiling the yield of thousands of acres

in this country has been increased anywhere from 10% to 200%, depending on the crop and local conditions. Soil that has been utterly unproductive has been made fertile.

If you have not looked into this question you should. As a first step write for our book, "Progressive Cultivation." It will be sent free on request. It not only discusses in detail the matter of subsoiling with dynamite but also tree planting, irrigation, drainage work, rock and stump blasting, etc.

You will find it worth reading. Send for your copy today. Please use the coupon below.

Livestock Facts and Fancies.

(By the Editor.)

Ever since the Pacific Rural Press began its work nearly fifty years ago it has labored persistently and consistently for the development of live stock industries in California. At the time of the establishment of this journal in 1870 it was very easy to look back to the very beginnings of the Americanization of California agriculture only twenty years earlier; and its declared purposes, to know accurately, to write conscientiously and to prophesy reasonably, commanded the cordial and generous support of the pioneers who were then still living in large numbers and active in developing permanent lines of production with the wisdom they had learned from their two decades of experimental effort. It was then seen that certain special lines of production could be pushed to great and distinguishing accomplishment which would bring to the State unique standing and large wealth. It was also seen that to realize the great and varied resources and adaptations of the State, practically all lines of production must be undertaken and developed, that California farmers might minister to all the needs of the largely increased population which her unique attractiveness and opportunities would assemble and to all the lines of trade in food products which could be profitably exported. Therefore the Pacific Rural Press was established not as a specialty journal but as a capable exponent of the diversified agriculture of a State which had no rival in the ability to produce, not only greatly but in great variety also.

In pursuit of this reasonable policy, the truth of which has been so amply demonstrated by new achievements in each of the last five decades, the Pacific Rural Press has made strong offensive drives on all agricultural fronts against doubt, distrust and ignorance of what California could do in successful and profitable production. It has therefore been the good fortune of this journal to be recognized, at one time and another, as a leader in the promotion of grain growing, wool growing, fruit growing, dairy and poultry production, meat production, etc., as each of these has arisen as a line of specialty development on the basis of demonstrations made of its capacity by its promotion as a factor in diversified farming. Our motto in all promising agricultural development has been: "Prove all things: hold fast that which is good."

In pursuit of this policy it has always been the ambition of this journal to be well informed, energetic and progressive in the promotion of the livestock resources and capabilities of California. It has always been alert to point out better ways to turn our splendid natural pasturage to good account and to urge the introduction of forage plants which would enhance the carrying power of our lands for domestic animals. It has been influential in the importation, local breeding and distribution of better animals. Years ago it found men with means and tastes for such public-spirited enterprises and it has helped them to

command the popular interest and patronage which have brought their honorable ventures to their own success and to the public service. It has led in dairy organization and ministered to the widespread adoption of advanced dairy machinery and methods which have constituted California one of the great dairy States of the Union. It worked for years in support of true conceptions of value in horses as agricultural agencies rather than as sport-factors. It has labored consistently to bring home-grown pork products to a higher standard by wiser feeding of better hogs and it has always urged that mutton and lamb should be well bred and fed farm products and not merely by-products of the wool and mohair industries.

In such undertakings, of which we mention a few only for the sake of concrete illustration, this journal has been actuated by the principles which prevailed in its establishment nearly fifty years ago, viz.: that reasonable promotion of the livestock industries must be based upon practical agricultural uses. Purchase of better stock for breeding, expenditure for better pasturage and supplementary feeding, the cost of better handling of animals for thrift and for protection against diseases—all these and others like them involve considerable effort and investment. From the points of view of individual prosperity and State building they can be reasonable only as they are resolutely held on the basis of actual producing values. It ought to be a clear fact that there is no other enduring basis upon which such efforts and expenditures can be urged. Of what use is it to boost the prices of purebred animals beyond the reach of those who alone can make profitable use of them? Of course we have no right to object to mutual admiration societies among breeders. Whether they practice their ritual on each other or on the animals they own, it matters not to us. We must remember, however, that the principles upon which this journal was established, and which it has always consistently labored to maintain are that the measure of value of an improved animal is its service in a reasonable farming scheme to help a producer get more profit from his effort and investment. Unless purebred animals are a constructive agency toward practicable farm improvement, they are simply works of art, fit to awaken thrills in the hearts of fanciers.

Of course, while we are shouting our "principles" like a presidential candidate, we do not forget that a breeder may have ends to serve in securing blood or publicity which will meet his desire for "points" in his stock or other points in his own popularity. We do not question his reasonable right to pay what he likes for such gains; nor do we question his wisdom, for we do not know anything about that. But if he has no such particular purposes to serve and simply undertakes co-operative boosting with the idea that a high sale average or a sky-shot for an in-

Auction Sale!

STENZEL'S HOLSTEINS Champion Butter Fat Producers WON FIRST AND SECOND IN THE FIVE-DAY BUTTER-FAT PRODUCTION CONTEST AT THE STATE FAIR.

Beryl Clothilde Hengerveld.

Beryl Clothilde Hengerveld's record for five days was:

351.9 lbs. Milk
21.11 " Butter

Test 4.7%

This beat by far all previous records made on State Fair Grounds.

Clothilde Pontiac Creamelle, recently at 2 yrs. 1 mo., made an official 7-day record of 22.52 lbs. butter, 391.7 lbs. milk, test 4.72%, making her CALIFORNIA CHAMPION TWO-YEAR-OLD.

GOOD ENOUGH FOR ANY HERD.

This youngster is half brother of the California Champion Two-Year-Old, both being sired by Dutchland Pietertje Creamelle. His dam is granddaughter of Pontiac Korndyke, the world's greatest Holstein sire, and she has a record of 28.17 lbs. butter, 456 lbs. milk, test 4.9%. This bull is perfect in type, 50% white, and just ready for service.

Anggie Grace Pontiac Creamelle.
Born Apr. 22, 1915.

A few other choice young bulls with butterfat breeding behind them.

F. STENZEL, Breeder of High Test Holsteins
SAN LORENZO, CALIFORNIA.

dividual, will engender a general demand among farmers for purebred stock, he is very apt to be mistaken. It may attract rich amateurs to plan entering breeding business on the basis of inflated prices, but they might otherwise do something worse with their money. In our notion it is not desirable that purebred stock should establish a higher auction value here than elsewhere, as we have heard that it is coming to be. It will not only keep farmers from buying but also shunt to other parts of the country an export trade we should have. It should be known around the Pacific Coast that California not only has good purebreds but California is a good place to buy them. Unless the business is built up this way it will fall over.

We are tempted to indulge in separate writing along livestock lines in this and coming issues because we have always kept the faith with domestic animals as a basic factor in California agriculture ever since we entered on the service of this publication in 1875, and because we enjoy the effort to keep them straight before the public. By particular attention and a liberal policy the present publisher, Mr. Honeywell, has carried the breeders' interest and support of the Pacific Rural Press beyond anything of the kind ever attained before. He has done that by being true to his conviction that a larger livestock industry, based upon a genuine belief in the purebred animal, is a constructive factor in the greater California farming which is

to come. We fully concur in that view and shall work for it.

Another condition which tempts us to place more emphasis upon this phase of our work, is the greater apparent opportunity and need for it. The only California publication which made a broad titular claim to serve the animal industries, the Live Stock Journal, recently of Sacramento, fell into the cutter and has been comminuted and blown into the silo of one of our southern contemporaries, where it will ferment into oblivion, along with the other journalistic stover which had previously taken the same course. The Butchers and Stock Growers' Journal still floats in the blue but it loves the first part of its name too dearly to follow broad lines. The Pacific Dairy Review still has the sunrise hue, but it, too, chooses rather strict specialization. Therefore it remains for the Pacific Rural Press to reassert the faith in livestock, in which it was born half a century ago and for which it has labored uninterruptedly ever since, and to summon all Californians to renewed and increased interest in the livestock industry on the good old basis of its fundamental relation to the full development of the State and to promote this industry in a true, constructive and educational way for the greater prosperity of all who honestly and reasonably engage in it.

In this effort we must write as we see and think. If we think not aright and see not straight, the reader has a duty to perform.

Growing Importance of the Purebred.

[Written for Pacific Rural Press.]

California has only commenced to realize the importance of purebred beef cattle; and is therefore just in its infancy as a purebred beef State; but destined to become the home of more good herds than any State in the Union, because of our favorable feed and climatic conditions.

Such is the belief of D. B. Harris, manager of the Sierra Vista Vineyard Company whose ranch is located at Minturn, Madera county, where the work of building up a fine herd of registered Herefords has been under way for the past nine years.

The present herd numbers over 60 head, of which 30 are mature cows and 10 are heifers. Many of these are sired by a Beau Perfect bull which Mr. Harris purchased in the East several years ago, but the herd sire of the future will be a yearling bull brought from the East this year, last year's best son of Perfection Fairfax, known as the King of Herefords.

Never, in late years at least, has a better bred or more promising show bull been brought to California than this young fellow; and by careful handling Mr. Harris expects to breed most of his cows to him when he gets a little older. As a yearling, a month after making the trip he weighs about 1,000 pounds.

One of the factors which Mr. Harris believes will have a great deal to do with the future production of this class of cattle is the simplicity with which they may be raised on alfalfa land.

On the Sierra Vista Vineyard, the

problem is not so much one of keeping the purebreds fat but of keeping them thin enough for breeding, notwithstanding the fact that they have but a small acreage of alfalfa to run on and even that does not produce heavily except during the spring months when moisture is plentiful. In fact a small field containing 12 or 15 acres of old alfalfa carries the band of 30 cows most of the year; and with the exception of some trouble with foxtail, little attention is required.

NEVADA SHOULD GIVE HER DAIRY COWS MORE PROTECTION.

The past winter was a very severe one, and thousands of dollars were lost to the dairy interests of the State through the decreased production.

The principal importance is to keep up the milk flow. If the production is allowed to fall off, the original flow can not be regained until the cow calves again. This is especially true of cows which have been milking three months or more.

The dairy cow is thinly clad as compared with beef cattle. They do not have the fat to protect. In the cold weather the cow must warm her body by burning up her feed and tissues. This must be replaced by expensive feed, as alfalfa hay. A warm barn can be built almost as cheap as a shed, and the cows kept comfortable in extremely cold weather. This would seem to really more than pay in the long run.

THE KIND OF HOLSTEINS YOU WANT TO OWN

Will be offered at your own price at the
STATE FAIR GROUNDS Sacramento, Cal.
OCTOBER 26-27, 1916

FROM THE HERDS OF

BELLA VISTA HERD Hampshire Swine

THE SUPERIOR QUALITY OF THE HAMPSHIRE HOG is rapidly being recognized. The Hampshire Exhibit at the State Fair was excellent, and, as usual, THE BELLA VISTA HERD helped make it a success, winning 23 prizes with 22 entries.

Specially this herd was awarded:

FIRST AND GRAND CHAMPION for best female Hampshire shown.

CHAMPION BOAR, any age, bred by exhibitor.

CHAMPION SOW, any age, bred by exhibitor.

GOLD MEDAL, 4 swine, get of same boar, Berkeley King.

GOLD MEDAL, 4 swine, get of same sow, Showers.

SPECIAL SILVER TROPHY, awarded by American Hampshire Association for 4 pigs under 6 months, bred and exhibited by a resident of the State of California.

Some specially good gilts for sale, bred to Evans' Bond, the best bred boar on the Coast; his sire, Messenger Boy; dam, Nora Duchess.

Some fine young boars for service or weanlings, \$20 up.

ADDRESS:

1800 YEARLING RAMS AND 1000 EWES.

These sheep are purebred, large and smooth, with heavy fleece of fine, long, staple, white wool. Individuals or carload lots.

Prices reasonable.

Correspondence solicited.

CHAS. A. KIMBLE, HANFORD, CAL. Breeder and Importer.

Live Stock and Dairy Notes.

[Livestock breeders all over the State are invited to send on postal cards, notes regarding their sales, State and County Fair intentions, new stock, etc.]

DAIRYING AND DAIRYMEN.

Tulare creameries paid \$85,000 to dairymen for August deliveries of cream.

There is a big demand for young dairy stock in Northern California by Arizona buyers.

Exeter creamery butter got the highest number of points in the butter-scoring contest at the State Fair, the score being 93½.

Three dairymen were arrested recently by State Dairy Inspector Whitaker of Fresno, charged with improper sterilization of utensils.

A Guernsey 2-year-old heifer, Rois Valentine, owned by the Elliott-Brant ranch of Owensmouth, Los Angeles Co., yielded a profit of \$700 in one year to her owners.

The largest single shipment of butter ever forwarded from this Coast, totaling 125 tons, left for New York over the Western Pacific Railway the other day. Its ultimate destination is England.

F. W. Anderson, secretary of the State Dairy Bureau, after a tour of inspection to the creameries of the county, commends the creameries of Tulare Co. for their modern equipment and good management.

The last of the 700,000 pounds butter order, filled for the government by the California Central Creameries, has been delivered. A half million pounds of this was shipped from the Ferndale plant of this company.

C. N. Louth, a Jersey cattle breeder of the East, has secured enough advance orders in the Orland district for Jerseys to warrant his bringing a full carload from Kentucky. Most of these cattle will be bought at the Kentucky State Fair.

The highest mark in butter production among the 1,073 cows tested for August for members of the Stanislaus Cow Testing Association was reached when fifty-five won a place on the honor roll by making an average of 1.5 pounds a day for the thirty-one days.

The attention of those of our readers interested in Jersey cattle is directed to page 332 of this issue, where will be found the announcement of the auction sale of 75 registered Jerseys owned by Murray & Jones of Modesto. The sale will be held at Modesto, September 28.

The U. S. Dept. of Agriculture announces that reports from 166 firms in the United States show that these firms had 102,843,822 pounds of creamery butter in cold storage Sept. 1st. On the same authority, 152 firms show they had 30,437,771 pounds of American cheese in storage on the same date.

The seventh annual convention of the California Cream Operators' Association will be held in Ferndale Sept. 28-30. The train leaving San Francisco Wednesday morning at 7:45 on the California & Northwestern Railway reaches Ferndale that evening, making a daylight trip through a highly interesting tract of country. Humboldt promises a royal welcome to visitors.

Six cows in the Gridley Cow Testing Ass'n produced over 50 pounds of fat during July as follows: Holstein, owned by A. L. Kaiser, East Biggs, 63.4 lbs. fat; C. Goetz, Tudor, Shorthorn, 62.9 lbs. fat; Morehead and Son, Sutter City, Jersey, 58.3 lbs. fat; D. Beals, Gridley, Holstein, 58.3 lbs. fat; S. C. Doen, Oroville, Shorthorn-Jersey, 55.6 lbs. fat; J. H. Guill, Chico, Holstein, 51.2 lbs. fat.

The American Jersey Cattle Club of New York is to be represented in California by J. M. Roberts, ex-president of the Associated Students of the University Farm at Davis, and a member of the class of '16. Mr. Roberts' appointment is the outcome of the increased activity and wide-

awake campaigning promoted by the Club throughout the country. The Jersey is on her way back full speed into popular favor.

The call for the fourth entry of the California Educational Butter and Cheese Contest and the State Fair Contest, brought thirty-two cubes of butter and thirty-five cheese. The average score of all classes of cheese entered was 90.55, which was .5 higher than in the previous contest. Several of the entries were criticised for unclean odor and flavors. The next scoring takes place the first part of November. The average score of the 32 samples of butter submitted was 91.8.

BEEF CATTLE.

Blackleg has broken out among cattle in Sutter and Yuba counties. Only fat cows and calves seem to be affected by the disease.

Steers full-fed from birth should not run beyond 20 or 21 months of age, as there is a decided falling off in the rate of gain after this age, reports the Missouri Agricultural Experiment Station.

The Tehachapi Cattle Co. of Bakersfield expect to feed out a large number of beef cattle, mostly calves and yearlings, on their ranch in Kern county the coming winter. Roland Hill, manager, says that they have all of their large concrete silos well filled with kafir corn silage.

Approximately 9,493 square miles of territory in six States is released from quarantine on account of the Texas-fever cattle tick by an order signed by the Secretary of Agriculture effective September 15. The order releases the last area under quarantine in California.

HOGS AND SHEEP.

A sow owned by T. F. Sullivan of Tulare has farrowed 37 pigs in five months.

The Muzzy ranch of 4600 acres, has been sold to Henry Peters of Dixon for a sheep range.

Henry Peters of Dixon has recently purchased the 6,000 acre Muzzel ranch near Elmira for his increasing flocks of sheep.

Martin Pradere, a large sheep raiser of Carson Valley, Nevada, has sold his land and sheep to E. A. Settlemyer of Gardnerville.

Hogs valued at \$72,000 were shipped from Kings county to San Francisco markets in the month of August. They sold at an average price of 7½¢ a pound, and averaged 200 pounds in weight.

Homer Brown of Dixon received five head of big, white-wool Rambouillets from Hanford recently. Mr. Brown selects this French breed of sheep for the purpose of crossing with his Merinos.

Mr. John G. Taylor of Lovelock, Nev., who has extensive land holdings in Elko and Humboldt counties, has bought a number of fine Cotswold sheep from Joseph Hennen of Lamolille valley with which to improve his flocks.

According to figures compiled by the Hanford Chamber of Commerce there were \$72,000 worth of hogs shipped out of Kings county during August. They averaged 200 pounds in weight and sold for 7½ cents, f. o. b. Kings county shipping point.

Among others who purchased high class Shropshire rams from Bishop Bros. at the State Fair were Gion Gibson, manager of the J. S. Gibson Co. at Williams and W. H. Parrot of Loleta, Humboldt county. Both are considering the establishing of purebred flocks.

We are informed that the following sales have been effected by the Riverina Farms: Riverina Nema 14th, first prize senior sow pig at Sacramento to Frederick N. Woods,

LIVESTOCK DIRECTORY.

Rates in this directory, 3c per word each issue; or if carried weekly for one year, 2½¢ per word.

SWINE.

Poland Chinas.

SMITH'S POLAND-CHINAS—Sows and gilts bred to Joker, First Prize Boar at the Wisconsin State Fair, 1915. These sows and gilts, sired by Iowa Wonder, who is a son of A. Wonder, the most celebrated Poland-China boar, living or dead. Litters from this mating are the best I have ever seen anywhere. Prices low quality considered. Will sell one or a carload. As a special inducement each purchaser will be given a year's subscription to the American Swineherd, the best swine paper published and a copy of the Handbook on the Sow; also a copy of the Pig Feeders' Manual. Geo. A. Smith, Corcoran, Cal.

YOUNG POLAND CHINAS, LARGE TYPE—Boar IBA Wonder won first and Reserve Championship P. P. I. E., weighing 730 pounds under 2 years and in breeding condition. 60-day special—fine young sows bred to IBA Wonder at very low prices; also weanling pigs, either sex. Satisfaction, or money refunded. Produce of Dam: 1, Deer Creek Nema 8th, Riverina Farms.

PUENTE TRACTOR DEMONSTRATION.

[Written for Pacific Rural Press.]

"Tell us what tractor work you want to see done, and we will do it," was the general invitation issued by those in charge of the tractors of nearly a dozen manufacturers, with at least 21 machines demonstrating their various good points at the Puente Tractor Demonstration Sept. 19-23.

This can be only a report of the first day and of what was expected for the rest of the week, on account of our time of going to press. It was a greater and better demonstration in all ways than that at the State Fair.

The mornings were given over each day to demonstrations; and many kinds of work were shown. Wednesday, Thursday and Friday afternoons were given over to public demonstrations of plowing—everybody to be lined up on the corner of his laid-out field at 12:55 sharp, and everybody to start at 1:00 and at once. Each demonstration field was 900x1125 feet for the first days, and 400x1125 for the last.

"It isn't a question of educating people on the different uses of a tractor in a public demonstration by the tractor people as a whole," said Mr. Martin of the Bates Steel Mule Co., in whose hands most of the arrangements were placed. "The idea is to show all the machines at the same work on similar ground, so people can compare. Plowing is the basic operation for all of them."

Arrangements were complete before the opening. The private demonstration fields were carefully laid out on the basis of relative horsepower of the machines taking part. Several machines extra were on exhibit. A different field was laid out each day and the position of each tractor fixed on a chart. Each of

the fields was 450 feet long. The Sandusky, of which two machines were on the field, had a strip 315 feet wide; the two Bates Steel Mules had 273 feet; the Samson, with five machines on the field, had 336 feet; the Big Bull, 210 feet; the Los Angeles Tractor, 168 feet; the Hart-Parr and Happy Farmer tractors had 399 feet; the Sure Grip, 210 feet; the Lambert, 108 feet; Holt, 150 feet; Yuba, 357 feet; Best, 168. Much of the ground had produced a crop of beans this year, and made fine plowing.

Two fields side by side, 500x900 feet, were set apart for the big 75 h.p. Holt and Best machines. These were grain fields—cracked adobe soil, dry to the bottom. One of these machines pulled a Killefer tractor subsoiler of several standards, some 18 inches deep, after which the ground was plowed 16 inches deep, with the tremendous Killefer 4-gang plowing 64 inches wide. Other machinery exhibits included: Oliver plows and disks; Holt tractor land leveler; Moline plows, disks, clod mashers, etc.; Representative E. P. Bosbyshell Co., and John Deere machines; and an array of plows, harrows, fanning mill, silage cutters, feed grinder, hay chopper, etc., by Dixon-Griswold; mostly in tents. Fairbanks-Morse had engines and centrifugal pump operating near by.

Perfect weather and a location on a central boulevard tapping the magnificent highways of Southern California, helped insure a great attendance of farmers.

THE HELM SALE A SUCCESS.

The Holstein sale, held at the Frank M. Helm ranch near Fresno, on September 12th, was a pronounced success, under Col. Ben A. Rhoades, auctioneer. Bidding was spirited and prices ranged from \$100 up to \$600.

The Edgemoor Holstein Farm of Burbank bought eight cows and heifers at from \$195 to \$305 each. McAlister and Son, Chino, secured six cows and two heifers at from \$200 to \$310. Z. M. Dickey, Dinuba, got a bull for \$160. W. L. Chrissier, Riverdale, bought a bull for \$150. S. A. Hamilton, Snelling, bull for \$180. T. J. Gilkerson, Le-moore, a bull for \$165. John Phillips, Fresno, a bull (Segis Pontiac Mead), \$600. Alex Whaley, Tulare, two bulls at \$325 and \$335. R. F. Guerin, Visalia, two bulls at \$300 and \$400. W. W. Beard, Kerman, two cows, \$300 and \$310. H. E. Vogel, Fresno, bid in twelve cows, three heifers and two bulls, paying from \$150 to \$400 per head. A. W. Morris & Sons, Woodland, secured seven cows and one heifer, at prices ranging from \$150 to \$310. Kearney Vineyard, Fresno, bid in six bulls, paying from \$165 to \$200. H. O. Smith, Tipton, purchased twelve cows, two heifers and two bulls, paying from \$100 to \$295 each.

THE STANISLAUS FAIR.

[Written for Pacific Rural Press.]

As this is written it is apparent that the Stanislaus County Livestock Show and Exposition has developed, overnight almost, from a local pro-

ducts show into a show of State importance, second only to the State Fair in many respects.

Stanislaus is not only notable for its herds of purebred cattle, the pick of which is on exhibition at this fair, but it enjoys pre-eminence as the banner dairy county of California. Prizes aggregating \$2,250 have been offered for the best showings in the several lines of cattle, horses, and swine. There is a healthy rivalry for the generous cash prizes which have been offered by the fair management, and the showing of livestock is particularly strong, Monday's count showing 64 Duroc, 47 Poland-China, 32 Berkshire, 17 O. I. C., and 12 Yorkshire hogs on the grounds with more to come. Dairy cattle were represented by 89 Jerseys, 53 Holsteins, 23 Ayrshires, and 20 Shorthorns. The stock judging will be done by Prof. Gordon H. True of the University of California.

The agricultural, horticultural, and commercial exhibits are of unusual beauty, and of State Fair quality. A comprehensive exhibit of automobiles occupies a 50x200 foot tent.

Not the least interesting exhibit at the fair is a baby show, six prizes being offered, ranging from \$1 to \$5.

First Prizes to Farm-bred Horses.

[By Wayne Dinsmore, Sec'y Percheron Society of America.]

Nearly all of the Percherons in the United States are being bred by men who have small studs ranging from two to ten mares. That these small breeders are successful proves encouraging to others who contemplate replacing their present grade horses with purebred mares.

The success won by the small breeders at the Ohio and Iowa State Fairs is of particular interest in this connection. At the Iowa State Fair, the first prize two-year-old stallion headed a ring of more than 20 two-year-olds, which were admittedly of as high character as any ring of two-year-olds ever shown at that Fair. This horse was bred by a small breeder who has but four or five mares and who, in his desire to breed high-class Percherons, went to the expense of purchasing a stallion for his own use.

The first prize yearling stallion, also winner of the Futurity Class, at the Iowa State Fair, in a ring of 22 stallions, was bred by a small farmer who owns only ten or twelve mares.

The first prize yearling filly at the Iowa State Fair, also winner of the Futurity Stake, was bred by a breeder who owns but a small band of mares, and who, furthermore, was making his first exhibit at the Iowa State Fair.

At the Ohio State Fair, the first prize two-year-old stallion was bred by a farmer who has only 12 or 15 mares, but who was sufficiently determined to have a good stallion to go out and buy a stallion for his

own use.

The first prize yearling stallion was bred by another farmer, who has only eight or ten mares.

The first prize yearling filly was also bred by a small breeder.

The yearling stallion and yearling filly just referred to were winners of the Eastern Percheron Breeders Futurity, so that six out of a possible eight first prize winners in the two-year-old and yearling classes at these two great State fairs, were bred by small breeders who owned only enough mares to do their farm work, and in all instances the Percheron mares which produced these winners were mares which did their full share of work on the farms where they are kept.

The fact that these colts, bred by small breeders who keep Percheron mares for strictly utility purposes, were able to win over the best colts sent forward by the larger breeding establishments, has especial significance. It shows that numbers are not necessary to success, and shows that the small breeder who is a good judge of horses can, by exercising care in the selection of his foundation stock, and by breeding to sires of approved type, achieve marked success in horse breeding. It goes without saying that these colts, all of them, received the best of feed and care, for while none of them were fat, they were all well grown in frame and muscle and showed ample evidence of having received plenty of food from birth.

EDGEMOOR GUERNSEY SALE.

[Written for Pacific Rural Press.]

With an average of almost \$230 for 30 head the auction sale of Guernseys held at the State Fair Grounds, September 6, by Edgemoor Farms was considered very satisfactory from a seller's standpoint.

As has been the case with all livestock auction sales in the State, buyers used a good deal of discrimination, picking the good ones with an evident disregard of price but fighting away from the mediocre ones, despite Col. Ben Rhodes urgent solicitation.

Guernsey men from all over the coast were present, buyers being as follows: Grapewild Farms, Escalon, \$1945; Frank Helm, Fresno, \$1535; D. O. Brant, Owensmouth, \$1395; Calla Grove Farm, Manteca, \$650; L. D. Smith, Berkeley, \$295; C. T. Wilson, Portland Oregon, \$400; W. J. Higdon, Tulare, \$240; C. S. Rasmussen, Loleta, \$175; W. H. Saylor, San Francisco, \$150; D. W. Wiley, Soledad, \$180; R. J. Van Teger, Live Oaks, \$50; Mrs. H. A. Palm, Sacramento, \$60. Average for 25 cows, \$250.60. Average for five bulls, \$122.

JERSEY BREEDERS MEET.

[Written for Pacific Rural Press.]

The California Jersey Cattle Club held their regular annual meeting and banquet, September 7, at Sacramento, electing J. W. Coppini of Ferndale, president to succeed Ralph Watson, C. D. Hayworth of Modesto was chosen for vice-president. J. E. Thorpe of Stockton will continue as secretary of the association for another year.

The action of the association in electing a Humboldt county breeder as president and a Stanislaus county breeder as vice-president will simplify the holding of more meetings in all parts of the State than has been possible in the past.

RAISING CALVES ON A MARKET MILK DAIRY.

[Written for Pacific Rural Press.]

Quite frequently dairymen who are selling whole milk believe that they cannot afford to raise their own heifer calves because of the milk expense. An exception to this case is A. Haley of Alameda county, who runs a 120-cow dairy and who sells his milk in San Francisco.

Mr. Haley's experience has shown him that he cannot buy high producing cows nearly so cheaply and surely as he can raise them himself, even though whole milk is worth over 15 cents a gallon to him.

For the first two months he feeds whole milk to his calves twice a day. During the next two months they are fed milk once a day and allowed the run of a pasture. After that they are pastured and fed some mill feeds.

Care is used also in selecting the heifers, only those from the heaviest producing cows being kept, the others being sold at birth to a calf buyer who makes a specialty of raising them to a vealing age.

July and August have been exceptionally prosperous months for Fresno county dairymen. Figures furnished by the Danish Creamery Association gives the gross receipts for August at about \$100,000, and the production in excess of 300,000 pounds of butterfat.

SANTA ANITA RANCHO

ANOAKIA BREEDING FARM

FIRST ANNUAL SALE, OCTOBER 23rd and 24th.

ARABIAN THOROUGHBREDS: Two-year-olds, sired by Imported Stallion Ibn Mah-russ, head of our Arabian Stud. Dams are the choicest thoroughbred mares of Santa Anita Rancho.

SADDLE HORSES: Fourteen of them, some of which are sired by Ibn Mah-russ, world renowned imported desert saddle stallion, and Don Costano, a five-gaited Kentucky saddle stallion. These horses are mostly three-year-olds.

POLAND CHINA AND BERKSHIRE BOARS: Four to nine months old. Sired by famous Poland China herd boars—Banker's Boy and Glenview Wonder. And Berkshire Boars—Kintyre Laird, Grandson's Duke and Fashion's Longfellow 5th. The dams are from the very best blood lines. Most all these animals have winnings at World's Fair.

HOLSTEINS: We will sell a number of young bulls. Some sires and grandsons of the noted Prince Gelsche Walker, and bulls from one World-Record cow and two California State-Record cows. Sixty females of the highest class will be consigned. Write for catalogue.

WORK HORSES AND MULES will also be offered for sale.

SOWS DON'T BREED.

To the Editor: A number of purebred Poland China sows have failed to get with pig although have tried everything imaginable, but no medicine. These sows are all ages, are in good flesh but not overly fat for Polands, are fed on skim milk and alfalfa. A very few of them breed regularly to the herd sire but the rest seem hopeless.—J. C. L., Tulare.

[This is probably a form of leucorrhea or chronic catarrh. Would advise douching with a warm solution of cooking soda once a day. One tablespoonful per pint of water.]

LUMP UNDER TAIL.

To the Editor: Early last spring, a soft spongy lump started under the tail above the rectum of a mare. Lately it has enlarged so it about covers the rectum and seems to pain her.—D. M., Boulder Creek.

[Operative treatment is indicated here. Call in your veterinarian.]

SHEEP RUN AT NOSE.

To the Editor: Twenty sheep and lambs in fine shape and well fed cough and run at the nose. Is it dangerous or catching?—H. H. E., Clio.

[Call in the State Veterinarian.]

This may be verminous bronchitis.]

MILK BLOODY AND THICK.

To the Editor: A fresh cow gave milk that was bloody, then got thick and curdy and most of the flow has stopped. We gave potassium iodide following a large dose of salts, for several days without results.

[Continue the iodide treatment for at least two weeks.]

PIGS COUGH.

To the Editor: Shoats weighing 50 to 70 pounds have a dry cough, and one dies about every 10 days. Have been on alfalfa and barley pasture all summer. In the last few days, a brood sow has commenced to cough in the same way.—H. H. R., Lassen.

[Call in your nearest veterinarian and have his opinion as to whether this is cholera or not.]

HOOF'S CRACKED.

To the Editor: Two horses are quite lame at times when driven on country road. One has a "contracted hoof" and the other a crack in the heel or soft part. Doctoring makes it better; then it gets worse.—E. B., San Juan.

[Have both these horses shod with tips which allow the heels no contact with the ground.]

BELLY ACHE.

To the Editor: Our animal has spells in which she groans as if in pain, refuses to eat, is stiff in her legs, her back is cold along the spine.—H. C. P., Pixley.

[Give two pounds epsom salts at one dose.]

SORE TEAT, GARGET.

To the Editor: A cow giving 5 gallons milk daily got the end of one teat cut on barb wire a month ago. It seemed to heal, but afterward that teat gave stringy, clotty milk and there is a hard core from the base of the teat upward. Milk it clean every day twice. Have treated for garget with saltpetre and poke root, have syringed with peroxide, and rubbed in turpentine and oil. Is alfalfa hay a healthy feed if fed alone?—E. M. S., Merced.

[Look up treatments given for garget. Alfalfa is all right alone but it is better combined with some grain.]

WEAK IN HIND LEGS.

Have fed eight pigs three months old, milk soured in a barrel. They got weak in the hind legs and wobbled. One drags his hind parts. Legs are not swollen.—Sub., Kingsburg.

[Give these pigs one dram arecanut and follow with one tablespoonful epsom salts.]

GARGET.

To the Editor: I have a cow that had a calf two weeks ago and three of her teats give milk very slowly; the other is all right. This is her fifth calf.—M. T., Moraga.

[Look up treatments given for garget.]

ABORTION.

To the Editor: Within a week three cows have aborted with calves 7, 5, and 3 months along. Cows looked well. Fed alfalfa hay darkened by being slightly heated. Had good clear water. This is my first trouble of this kind.—G. G., Pixley.

[This looks like contagious abortion, but the history points to forage poison due to the moldy alfalfa, which will cause abortion.]

WOODLAND, CAL.

A Farmers' Fair at Napa.

[Written for Pacific Rural Press.]

The County Fair held at Napa last week was essentially a farmers' event. It was suggested and promoted by the Napa County Farm Bureau and ably managed by Farm Adviser H. J. Baade.

Being a farmers' institution it was natural that farmers should support it both from an exhibitor's and an attendance standpoint. And this they did in a manner that was surprising to everybody concerned.

The agricultural and horticultural exhibits were made up entirely by Farm Centers, there being seven of these exhibits which ably presented the vast agricultural and horticultural resources of Napa county. These were housed in commodious tents where one also found industrial, school, women's work and better baby exhibits that were educational in nature and pleasing to look at.

The most surprising exhibits, at least to the stranger, were in the livestock division. Here one found dairy cattle, hogs, sheep and horses in surprising numbers and high in quality.

Here one realized the change that is taking place in Napa county agriculture. There is only one meaning to a representative livestock show in a horticultural county: diversification instead of specialization.

In dairy cattle you saw State Fair prize winners in the Guernsey herd of B. E. Nixon and the Holstein herd of the Napa State Hospital. Jerseys

were shown by M. L. Mitchell and F. M. Johnson.

Hogs which have commanded more than ordinary attention from the Napa county farmer in recent years were largest in numbers. Durocs have gained a strong footing and this was evidenced in the show. Here you found additional strength by the addition of the first and second prize yearling boars at Sacramento and the first prize yearling sow, all three purchased the week previous to add quality to Napa county Durocs.

The largest single exhibit of hogs was made by the A. L. Tubbs Co. with Yorkshires. Here also was State Fair material shown by a Napa county breeder. Berkshires and Poland Chinas were shown largely by members of the Napa High School Agricultural Club. Sheep, lacking the showman's professional touches, but bearing evidence of utility, were on display, as were also draft horses.

Poultry, for long the horticulturist's friend, was well represented by exhibits of choice breeds.

The farm folks of Napa county were proud of their first agricultural fair. It was better than they had expected but not so good as the one they are already planning to hold next year. And well they may be proud, for it was promoted and supported almost solely by Napa county people, no exhibits from other counties being shown.

250-POUND HOGS IN EIGHT MONTHS.

[Written for Pacific Rural Press.]

The growing conviction among hog raisers is that to make the most money from a hog, it should be turned off at a much earlier age than has been the custom. Experience seems to show eight months a reasonable length of time for a well-bred hog to put on 200 to 250 pounds of flesh.

This is the age and weight that R. R. Henderson of Kings county has been marketing his purebred Poland Chinas and at a good profit.

Mr. Henderson's experience, like other successful hog raisers, has been that to secure such weights some grain must be fed all of the time.

To his sows and young pigs he feeds soaked middlings and ground barley, with alfalfa pasture. This is continued till the pigs are three or four months old when they are put on a straight ground-barley ration and alfalfa pasture. When the final fattening period starts, barley is replaced by ground corn which is grown on the ranch, the hogs at this time being closely confined and not given any room for exercise.

During winter months, the feed is somewhat varied, yellow pie-pumpkins then taking the place of alfalfa. Often the supply lasts till the first of January. These furnish a good succulent growing food in connection with grain, and are grown at small expense on pieces of land that would otherwise lie idle.

To secure the advantages of alfalfa pasture and not damage it by over-pasturing, all the pens are

made of movable panels which allow frequent and easy changing.

Individual houses are used for the brood sows at farrowing time. The average number of pigs raised per litter with this system has been eight.

After weaning time, the hog does not enjoy the protection of any specially constructed house, shade and shelter being provided for each pen in the form of home-constructed, straw-thatched roofs, supported by posts. Each pen is provided with fresh drinking water but no wallow.

The experience on this ranch, like many another in Kings county, seems to show that feed and breeding are more essential than fine quarters, in the economical production of market hogs.

SANITARY CALF BARN.

[Written for Pacific Rural Press.]

While many dairy calves are grown in California without shelter of any kind other than trees or the small amount furnished at the side of buildings, better calf culture is possible when a special building is provided for them. This also simplifies the work of feeding, as was recently seen at the dairy of the State Hospital at Napa.

The tax rate of the Modesto Irrigation district has been fixed at \$3 on \$100 assessed valuation.

QUESTIONS AND TAFFY.

[Written for Pacific Rural Press by Susan Swaysgood, Pomona.]

Hens Gasp and Wheeze.—What is the cause of "gapes"? Had a hen die recently from it. She breathed through her mouth, extending neck at same time and gasping, made a noise like an asthma sufferer. — D. C. R., Galt.

I have lived in California nearly a quarter of a century and had chickens all the time and never yet met a case of "gapes." There is no such disease in this state. Your chickens are suffering from bronchial trouble; and the one that died lived until the disease reached the lungs. Unless you treat the whole flock it may become epidemic and cause you much loss and trouble. Clean up all your grounds as well as possible and keep all lime away from the yards or dropping boards. Sometimes dry lime will so irritate the lining of hens' throats as to cause bronchitis, yet some poultrymen continue to throw it around. Give tincture of aconite in the drinking water or in a little warm mash, allowing one or two drops for each fowl. Repeat this treatment about three times per day, and you will cure all that are curable in two days and prevent others from getting it, provided your housing is right.

Catarrh in Eyes.—What is the cause and fault with my chicks? They have mattery eyes and have some trouble in breathing. — S. C. S., Tres Pinos.

The fault is not with the chicks but with the care given them. They have catarrhal cold which is fast developing into roup. You did not state the age, or if they are brooder chicks or older ones that perch, so it is difficult to advise. Anyway the chicks have a bad cold and you should investigate their sleeping quarters. The remedy lies in correcting the cause and trying to stop the spread of it. Give all of them a dose of castor oil in a little warm mash, wash the eyes and nose in a solution of peroxide of hydrogen and water, made strong enough to kill the germs. Do this for several days but repeat the oil treatment only once, about two days after the first treatment. See that the chicks are not exposed to drafts of cold air and are not crowded in corners, as this is very often the cause of colds.

Taffy, Prunes, Chickens, Bees.—Three years ago you wrote an article in the Press about prunes, chickens, and bees. Well, I had the prune trees getting old, and I thought it would be best to replant between the rows and dig the old trees out in a year or two. But after considering what you said, it seemed to me pretty good logic. Then I set about getting the chickens and bees, bought some Orpingtons from you and some Leghorns from Petaluma. After the first year sold the Leghorns, as I found I got more eggs in winter from the Orpingtons; and I bought twenty stands of bees.

The result has been most gratifying. Most of my neighbors are shy of prunes this year while I have a very fair crop, and have enough honey besides what is sold to more

than pay whatever expense I went to. The chickens have enriched the soil and made all my fruit trees look fifty per cent better than before the chickens. The trouble with fruit growers in this (Placer) county, and I suppose other places, is that we don't put enough back on the land. Our peaches this year are heavier than usual and I give the credit to the chickens. They put fertilizer on the ground, scratch around and keep the ground stirred up better than a man and cultivator. We grow more fruit hereabouts for shipping than for drying, but it weighs whether green or dried. Our prunes are good and are nearly dry now and instead of digging these trees out, wish I had more. — Orchardist.

CHICKS' EYES MATTERED.

To the Editor: Leghorn chicks were hatched in June. They have done nicely, and are putting on size and weight. They show no indications of bowel trouble; no symptoms of cholera, with which I have had much experience in past years. Several deaths have occurred the past week. I find a number with watery eyes, some slightly matterated. The chick droops and dies. There is no swelling on the head except in the eye, and those I have examined have shown clean mouths. It does not appear to be roup. The chick is in good flesh and feather, and retains its appetite. — L. B., Glen Ellen.

[This looks like pox. Vaccinate.]

VALUE OF DUCKS.

To the Editor: What is the value of white Indian Runner ducks about two months old (full feathered and from a very good egg-laying strain)? I should like to sell for breeding, as I think that will pay best. — Mrs. R. D. K., Richfield.

[Answered by Geo. H. Croley, San Francisco.]

[Good quality, purebred white Indian Runner ducklings two months old intended for breeding, should be worth 50 cents to \$1.00 each. If exceptional specimens were selected, these values might be greatly increased. The value of a duckling at this age is greatly influenced by the feed and intelligent care it has received. A fixed price could not be stated without seeing them.]

POULTRY NOTES.

About 143,000,000 dozen of eggs are held in cold storage by 221 firms in the U. S., says a report of the Dept. of Agriculture recently issued.

Premium lists of the 19th annual show of the Santa Clara Valley Poultry and Livestock Association are ready for distribution. Address Secretary Charles R. Harker, Porter Building, San Jose.

In explaining the purposes of the new organization known as the Poultry producers of Central California, Inc., which if successfully promoted will market the entire poultry product of this section of the State, State Market Director Weinstock says: "Under this plan Central California is to be divided into districts, but before the organization may become effective at least 75 per cent of the poultry of the districts shall be represented by the signed contracts. This would mean that the organization would control approximately 1,000,000 hens. No stock shall be disposed of except to poultry raisers, and should a purchaser go out of business, the association retains the right to pur-

chase such stock in preference to outside buyers. The producer agrees to market all his eggs and poultry through the association for such products, less 2 cents per dozen on eggs, and 50 cents per dozen on poultry, the estimated selling costs."

Farmers and their wives who attend the practical Short Courses given by the poultry division of the University Farm will benefit by investigations carried on for the past three years concerning comparative feeding values of high protein feeds, such as meat scrap, fish scrap, buttermilk, linseed, soy beans and coconut meals, blood meal, tankage, alfalfa meal, etc., for laying hens. They will also learn how to hatch, rear, feed, breed, and care for fowls. Instruction will be given in practical carpentry work as applied to building poultry houses and making coops, nests, hoppers, crates, etc. Demonstrations will be given of the best way to grow such crops as alfalfa, rape, kale, beets, etc., for green feed for fowls.

Poultry Breeders' Directory.

CLOSING OUT—FOR SALE CHEAP.—3 Electric Incubators, 576 egg capacity each. 2 Electric Incubators, 144 egg capacity each. 16 Electric Brooders, 150 chick capacity each. Complete with circuit breakers, thermostats, connecting sockets, etc. Address T. R. Jacobs, P. O. Box 395, San Mateo, Cal.

BARRED PLYMOUTH ROCKS.—"The kind that Win and Lay." Eggs for hatching and choice stock for sale. Have bred Barred Rocks for over nineteen years exclusively. Write for catalog showing winnings at California's leading shows. Chas. H. Voden, Box 398, Los Gatos, Cal.

INCUBATOR CHICKS.—Thoroughbred White Plymouth Rock, \$25.00 per hundred; White Leghorn, \$12.50 per hundred. Highest class of stock bred to standard and to lay. Awarded all first prizes at California State Fair 1916. Mahajo Farm, P. O. Box 597, Sacramento, Cal.

BABY CHICKS NOW READY.—Hatches every week. Write for special "Fall Chick" circular. See why Fall chicks pay. R. I. Reds, Barred Rocks, Black Minorcas, White and Brown Leghorns. Campbell Poultry Ranch, Campbell, Cal.

CROLEY'S DRY MIXED INFANT CHICK FEEDS for twenty-five years have been California's standard feed for baby chicks. Insist upon getting same from your dealer. Manufactured by GEO. H. CROLEY CO., Inc., Poultry Supplies, San Francisco.

BUFF ORPINGTON CHICKS.—September and October delivery. First hatch Sept. 13th. Orders taken for from 25 to 150; \$15 per 100. Eggs \$1.50 per 15; \$8 per 100. The Ferris Ranch, Rt. 2, 144 D, Pomona, Cal.

THE SANTA CLARA VALLEY HATCHERY solicits your orders for Fall and Spring delivery in 8 breeds of baby chicks. Order early and get the best. Jos. A. Bihn, Lincoln Ave., San Jose, Cal.

1000 BARRED ROCK, R. I. Red Baby Chicks. How many do you want? Price and quality will suit. Roofden Poultry Ranch, Campbell, Cal.

EASTMAN'S REED TO LAY Barred Plymouth Rocks, Chicks, Eggs, Cockerels. Fairmead Poultry Farm, Fairmead, Cal.

DAY-OLD CHICKS.—These chicks are hatched from our own flock of 8,000 Utility White Leghorn Hens. George Bros., Petaluma, Cal.

CHICKENS, DUCKS, GEESE, GUINEAS. Pea Fowl, Pigeons, Wm. A. French, 545 W. Park St., Stockton, Cal.

WHITE WYANDOTTES.—Blue-ribbon winners. Eggs \$2 to \$5. Chicks, pullets, cockerels. R. W. Strawetski, Route 2, San Jose, Cal.

ONE PAIR Plumaged Golden Pheasants. T. D. Morris, Agua Caliente, Cal.

TURKEYS, DUCKS AND GEESE.

HART'S BRONZE TURKEYS AND EGGS.—Large reduction in price of stock. Order now for fall delivery. Free Circulars. Albert M. Hart, Clements, Cal.

Keep Those Nests Clean

Mites, scaly leg and germs of roup, canker, white diarrhea and other diseases lurk unseen and unsuspected in the straw or shavings. Neglect may be the cause of infection wiping out your flock. Prevent the entrance and spread of disease by sprinkling the nests with

CARBOLA
The Disinfecting White Paint

Guaranteed harmless to the birds yet is 20 times stronger than carbolic acid in the destruction of germs. Comes in powder form. As a paint for the walls, ceilings and floors of poultry houses, cellars, dairies, barns and other places it is unequalled. Just mix with water and put on with brush or sprayer. Will paint any surface a beautiful snow-white and disinfect the premises at one operation. Will not taint food products of any kind.

Use It Instead of Whitewash

Will never flake, peel or blister. Adheres to wood, stone, brick or cement. Get it from your dealer. If he will not supply you send his name and your order to us.

10 lbs. (10 gals.) for \$1 and postage. 20 lbs. (20 gals.) for \$2 delivered free. 50 lbs. (50 gals.) for \$4 delivered free.

A trial package, enough to paint and disinfect 250 square feet, from your dealer or sent by parcel post for 25 cents.

GERMAIN SEED & PLANT CO., Distributors, Dept. L, LOS ANGELES, CAL.

Mrs. Best's Letter.

My dear Friends: The nearness of the first of October brings a realization that we must have fall clothes whether the task of selecting them is a pleasant one or not.

New models in suits are being shown in both fitted and belted models and the materials are wool velours, broadcloth, duvetyne, checks, and fine serges. The coats are quite a bit longer and sleeves have a tendency to be tighter and trimmed with fancy cuffs and buttons. The skirts are even with the tops of the boots, but it is equally good style to have them a little longer and much better taste for women who have passed their first youth.

The colors, in addition to navy blue, taupe and black, include plum, Burgundy and brown and there is a very extensive use of fur, mole, Hudson seal, beaver, and Patagonian kid fox.

Coats are very luxurious this year, made with wide flares, deep collars and large cuffs—many of them belted and some with fur trimming and others with entire capes of fur.

In hats, the two most popular models are the toques and the sailors. The toques are many times made of breast feathers in all colorings and if of velvet are worn with the new veil which is fastened to hang straight down all around, in some instances touching the shoulders. These veils are of fine net with designs and borders on them. The sailors are very simply trimmed, often just a flat ornament or the new wool embroidery in many colors. These are shown mostly in black, but there are also some beautiful white and soft grays.

Marabou trimming is having a revival of popularity. You see it on dresses and sweaters and also used as scarfs and large collars. It is very soft and pretty, but is not as durable as fur, especially in the rainy season.

Separate collars are quite the vogue this fall, the materials include organdie, net, Georgette crepe and white broadcloth. The styles include sailor collars, simple roll collars and others that fall far down the back.

To be modish this fall, the hand-bag must be odd and you will find them of velvet, steel-beaded moire, and crocheted, as well as ornamental leather.

Shoes are high, in both cut and price, and have many combinations of colors as well as the conservative blacks and bronzes. One very good style is to match the upper of the shoe to the suit or dress.

Rosabella Best.

LAUNDRY HINTS.

Discolored white or cream-colored lace may be bleached by washing and dipping in blue water, then cover with a lather of castile soap and dry in the sun. Afterwards, rinse in cold water and iron.

Tar stains should be rubbed with lard, then washed with warm water and paint stains with turpentine.

If you rinse a plate with cold water before breaking the eggs on it, add to them a pinch of salt and then stand where there is a current of air, you will have no difficulty in beating them to a froth.

THE HOME CIRCLE

TO KILL COCKROACHES.

Editor Home Circle: The following is a reply to an inquiry that lately appeared in your publication: The brown or black cockroaches are a great pest to ships in tropical seas. They lie in the cracks of the woodwork and come out at night. A certain remedy is to get five or six pounds of crude alum and dissolve in hot water, and having cleared the pantry of all movables, wash all the woodwork and hard paint thoroughly with the hot strong solution. The cockroaches will disappear with the first application generally, but occasionally a second may be needed. No dead ones will be seen; they simply disappear. W. H. Marston. Berkeley.

A COOKY DRAWER.

Having hit upon an excellent place for keeping cookies, I thought some one else might welcome the idea. I took a smooth, wooden grocery box, three inches deep and three feet long and as wide as the pantry shelves and painted it inside and out with white enamel paint. Then I hung it so as to pull out like a drawer close up under the lowest pantry shelf. The cookies can all be laid flat on sheets of waxed paper, thus preventing their breaking.—Mrs. D. S. G., Ripon.

GRAPE JUICE RECIPE.

Editor Home Circle: Will you give me a recipe for making grape juice for family use?—G. L. K., Haywards.

[Answered by Wm. V. Cruess, Zymologist at U. of C.]

In answer to your correspondent's request for a recipe for making grape juice for family use, would recommend the following procedure: Take equal quantities of ripe Muscat grapes and any red wine grape. The wine grape chosen should not be too ripe but should be of a tart or acid taste. Remove the berries from the stems and crush them together. Heat the crushed grapes, preferably in a double boiler, to a temperature of 130 degrees F. A dairy thermometer can be used for this purpose. During the heating process, the grapes should be stirred constantly to facilitate extraction of color. Set the grapes aside and let them stand for about six or eight hours. This allows time for the dissolving of the color from the skins. Press out the juice and strain it through a jelly bag until it is clear enough to bottle. The bottles used to receive the juice should be perfectly clean and should be scalded out with hot water before use. At the same time that the bottles are prepared, sterilize enough corks for

the purpose by boiling them in water for about four or five minutes. Fill the bottles to within an inch and a half of the top. Cork with the sterilized corks and tie the corks down with string. Prepare a sterilizer by placing a wire screen or a wooden grating in the bottom of a washboiler or a large pot. If a screen is not at hand, several layers of cloth will do for a false bottom. Place the bottles in a horizontal position on the bottom of this sterilizer. The bottles may be piled one upon another. Fill the boiler with cold water so that the bottles are completely immersed in it. Heat the water very slowly to a temperature of 175 degrees F. This temperature should not be exceeded and a temperature of at least 170 should be reached. The range is between 170 and 175. Maintain at this temperature for fifteen minutes. The water can then be poured off and the bottles removed to a quiet place to cool. Before the bottles have cooled, the corks should be dipped in hot paraffine and as they become cooler they should be dipped in paraffine at a moderate temperature so that the corks are completely coated with this substance. This will make an air-tight seal necessary for the prevention of spoilage by yeast or mold. Juice prepared in this way will not be absolutely clear but will have a good flavor and color.

PEACH KISSES.

Pare and halve six large, ripe peaches. Boil one pint of granulated sugar and one-fourth pint of water until the syrup snaps when dropped into cold water. Dip halved peaches into syrup and set away to harden on a buttered dish. When hard, whip the whites of four eggs stiff, beat into this five tablespoonfuls of powdered sugar and two tablespoonfuls of blanched and chopped almonds. Drop the egg mixture in large spoonfuls into a pan of boiling water and cook for a minute or two, then lift out carefully and place on a plate. Fill each peach half with this. Serve cool.

REST ROOMS.

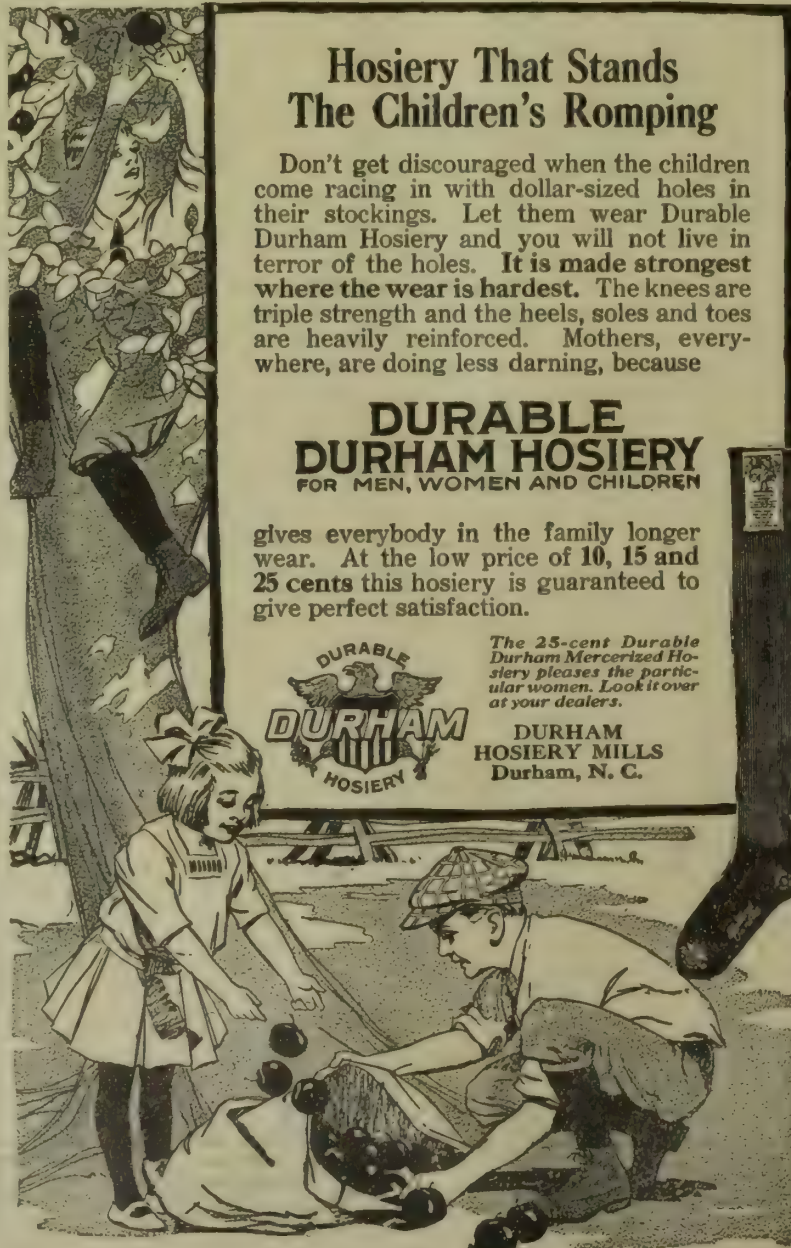

In the little town of Ripon, in the San Joaquin Valley, in front of a modest white cottage, is the hospitable sign "Rest Room and Library," and on the door the words, "Walk in." Obeying the invitation, the writer entered to find two rooms, with chairs and tables and a comfortable amount of reading in the form of books and periodicals.

These rooms, which were part of a house, were furnished and kept open by the Parent-Teachers' Association and were for the use of anyone who wished either to read or rest. They hope in time to furnish a third room with a couch or bed, for the use of mothers with small children who have driven to town and need some place to rest and care for their children.

He is happy whose circumstances suit his temper; but he is more excellent who can suit his temper to any circumstances.—Hume.

Slouchy postures menace health and induce bodily malformations.

Health brings happiness; sickness, misery.

**Hosiery That Stands
The Children's Romping**

Don't get discouraged when the children come racing in with dollar-sized holes in their stockings. Let them wear Durable Durham Hosiery and you will not live in terror of the holes. It is made strongest where the wear is hardest. The knees are triple strength and the heels, soles and toes are heavily reinforced. Mothers, everywhere, are doing less darning, because

Floral Department.

[By Geo. N. Tyler.]

Bulb Growing.—As it will soon be time to plant, a few notes might help. All bulbs require a very rich soil. Use only thoroughly decayed manure; two years old is the best. Under no consideration use green manure where bulbs are planted. Small bulbs, such as sparaxis, Ixias, crocus, etc., should be planted two inches deep; tulips, jonquils, Spanish iris, narcissus, etc., three inches; hyacinths four inches, and always measure the depth from the top of the bulb. You can plant from October to January. No bulb requires so rich a soil as the hyacinth. If planted in poor soil the flowers may do very well for the first year, and if planted more shallow than four inches the heat of the sun will cause the bulb to split and divide into innumerable small bulbs that will not bloom well for two or three years. Remember that all bulbs and plants have a tendency to lift while growing. Freezing and thawing have the same effect, so it is better to plant a little too deep than too shallow. Hyacinths should be set eight inches apart, tulips six, and smaller bulbs closer. Lillium candidum (St. Joseph lily) should be planted as soon as the corms can be procured—the same applies to Longiflorum, Specosium, and all the types of lilies. Plant candidum in the bright sun; and a shady location for the others. Do not try to bloom them for Easter as this can only be done in a greenhouse that is well heated.

Pot Culture.—It is very important that the bulb should form a strong root growth before leaf growth starts. Bulbs when flowered in pots in the house, should be kept in as cool a room as possible; a few degrees above freezing will answer. Pot the bulbs in pots of a sufficient size, in a sandy soil mixed with rotted cow manure and leaf mold (three parts sandy loam, one part manure, one part leaf mold) and give thorough drainage. After potting give a thorough soaking and then put away in a dark cool place for six weeks and water them every two weeks, or oftener if they require it. Never let them dry out after starting root growth, or you won't get any flowers. This is to encourage root growth. In six weeks' time leaf growth will have started, but do not move them directly into the sun for a week or two. You can put them out of doors on the porch where they will get a little morning sun and gradually give them more till they can stand the bright sun. Remember that all bulbs coming into flower require a great deal of water at the root, and in some cases twice a day is not too often to water them.

ATTRACTIVE SUMMER HOUSE.

Editor Home Circle: I read in the Rural Press of a few weeks ago a description of a playhouse for children where the covering was palm branches and I thought you might be interested to know how ours is made. In shape it is just like an arbor and instead of vines being planted around the sides, we planted Thompson seedless grapes and en-

couraged them to grow freely. In a very short time, the whole arbor was covered and the vines produce fruit as well. The green foliage lasts all through our hot weather and the arbor is a cool, attractive place for the little ones to play.—Mrs. D. S. H., Turlock.

Pickle for Meat.—To each gallon of water, allow 1 lb. salt, 6 ozs. brown sugar and 1 oz. saltpetre. Boil five minutes. When cold, the meat can be put in and should be kept for five days.

Sunlight and sanitation, and not finery or frippery, make the healthy baby.

Good Health.

[By H. E. Pastor, M. D.]

THE HOUSEHOLD MILK.

Pure, clean milk is an unexcelled article of food for both children and grown-ups. In California, at this season of the year, when pasturage is dry and the atmosphere laden more heavily than usual with invisible disease germs, when there is a lack of the cleansing effect of frequent rainfalls, care is especially necessary in the drawing of the milk and its subsequent handling. Typhoid, dysentery, and other diseases may be transmitted through

its agency. If you do not produce your own milk, obtain it from those only whose premises are kept scrupulously clean, and if your milk is dependable and satisfactory do not change your source of supply. Cows are not subject to many diseases dangerous to milk-users. If the cow is seemingly in good health and has no signs of udder inflammation, and has passed the tuberculin test, her milk is likely to be wholesome and safe. Better employ a veterinarian for the tuberculosis test. The milk-pail should be washed and scalded with clean water before using, the premises where the milking is done should be in sanitary condition, the hands of and person of the milker clean, and the milk should be cooled quickly after being drawn and kept cool until used.

Wise Procedures Not Always Compulsory.

An inquiry has been passed up to this department relative to the employment of a medical attendant in cases of childbirth—as to whether it is compulsory or optional. While it was not designed to pass upon medico-legal questions in this column, and we do not invite such, it may be said that such attendance is not legally compulsory, though neglect to do so in emergencies would render the offender subject to prosecution. The ushering into this with many dangers to both mother and babe; and while no untoward incident may accompany such an event, it is worse than imprudent to neglect professional aid when such may be obtained. Parturition may, as some contend, be a “natural” or physiological function, but it is one which borders closely on a pathological condition, and may easily, and frequently does, become mainly such. Don't take unnecessary chances.

Health vs. Wealth.

What doth it profit a man if he gain the whole world and lose his own health? is an admonition sent out by the U. S. Public Health Service. This is not exactly gospel truth, but is just as true as if it were. In the mad scramble for social or political position, for a competence and something more, to in some way get ahead of the other fellow, the ambitious man forgets the respect due his body and its limitations, and before he is aware of his indiscretion is suffering the inexorable consequences. With the loss of bodily health there is a loss of mental efficiency, and the strenuousness that was supposed to bring happiness and comfort results rather in wreckage. Be content with moderate attainment, and taste some of the joy of life as you go along.

Health Jottings.

Ill-health lowers earning power. Disease is one of the nation's greatest burdens—and largely an avoidable one.

The first step in national preparedness is for each of the nation's citizens to cultivate physical fitness in his own person.

If you persist in tolerating a polluted well on your farm, don't complain of the size and frequency of the undertaker's bill.

THE MARKET REPORTS

Figures Given Are Independent and Reliable.
Prices Quoted as Paid to Producers.

San Francisco, Sept. 20, 1916.

Wheat.

Export buying has caused a firmer feeling in the East, and there is a lively demand locally, which has sent values up a little further on club and Sonora varieties.

[f. o. b. San Francisco.]

Sonora wheat	\$2.15@2.20
Northern club	2.15@2.23
Calif. club, ctl.	2.10@2.20
Northern Bluestem	2.35@2.40
Northern Red	2.20@2.40

Barley.

The speculative market has developed a little weakness this week, with some pressure to sell, and while prices on the spot are firmly maintained the movement is rather quiet.

[f. o. b. San Francisco.]

Shipping, ctl.	\$1.75 @1.80
Choice feed, ctl.	1.67½ @1.70

Oats.

Prices stand unchanged, with a fairly active movement in both feed and seed grades. Good seed is scarce, and some holders are asking an advance, but there is a good deal of poor stock offered.

Red feed	\$1.80@1.85
Red seed	2.00@2.10
White	1.75@1.80
Black seed	3.00@3.25
Texas Red seed	2.25@2.35

Corn.

Eastern yellow moves slowly here, but there is some demand, and prices have again been marked up. Egyptian is in good demand at the old prices.

[f. o. b. San Francisco.]

Eastern Yellow, ctl.	\$2.10@2.15
Milo Maize	Nominal
Egyptian	1.95@2.05

Beans.

The bean market is beginning to show a little more life. There have been some small offerings of new-crop large and small whites, which have been taken up at high prices, as stock has been very scarce; but prices will be much lower shortly, when the harvest gets well along. The crop here is very good, and the Eastern outlook is much better now than it was a few months ago. Limas hold steady, and red kidney beans are lower. Spot supplies in general are well cleaned up, but some markets are still fairly well supplied, and prices are expected to get down to about the normal level within the next few weeks.

[On wharf, San Francisco.]

Bayos, per ctl.	\$4.75@5.00
Blackeyes	3.50@3.60
Cranberry beans	5.00@5.20
Horse beans	3.25@3.50
Small Whites (south) new crop	7.00
Large Whites, new crop	6.00
Pinks	5.50@5.75
Limas (south)	5.30@5.40
Red Kidney	6.50
Mexican Reds	5.25@5.40
Tepary beans	4.50@4.75

Seeds.

More alfalfa is coming in, and some is offered below the last quotations. Oregon vetch is also available at easier prices, though it is not offered very freely. Canada peas are scarce.

[Wholesale prices, S. F.]

Hay.

Arrivals last week were the lightest in a long time, most of it coming by boat, as it is still impossible to get cars to handle the shipments from many sections. However, it is believed that most of the hay has been taken from the fields, and little increase in arrivals is expected from now on, un-

til the movement from warehouses begins. Local business is not very active, but prices are well maintained; and there has been a very satisfactory trade in the country, which promises to increase during the winter. A new factor of strength is the awarding to a local firm of a contract for 9,000 tons for Government use in Manila and Hawaii.

[Wholesale prices per ton, carload lots, San Francisco.]

Wheat, No. 1	\$13.00@14.50

Rolled barley	34.00@35.00
Tankage	45.00
Rolled oats	34.00@35.00
Rice middlings	30.00@32.00

Vegetables.

Prices show very little change from last week, most lines of summer stock, such as tomatoes, cucumbers, summer squash, peppers, eggplant, etc., being in more liberal supply, with prices about as low as they ever go. The cannery demand still helps tomatoes out a little. Celery is becoming more plentiful, and good stock is offered at 10c. String beans are steady, with little attractive stock offered, but limas are lower. Green corn holds steady at the former level.

Celery, Alameda, bunch	15@19c
Cucumbers, lug	2@30c
String Beans	2@4c
Lima Beans	2@3c

Peas, lb	5@6c
Tomatoes, lugs	25@50c
Green Corn, sack	50@1.50
Okra, box	40@60c

Potatoes and Onions.

The outside call for potatoes has dropped off sharply, resulting in a recession in prices for both Delta and Salinas stock, \$1.75 being the top price for the former. Sweetens continue to gradually decline. Onions have been marked up a little locally, but a drop is reported in Eastern markets, following reports of a large crop in Oregon.

[On wharf, San Francisco.]

Potatoes, ctl., Delta	\$1.50@1.75

Special Deciduous Market Report.

By J. L. Nagle.

Sacramento, Sept. 18, 1916.

Inactive demand and heavy shipments from Eastern states has caused all markets to break on Freestone peaches. This, however, does not apply to Clingstones, which are being offered freely and at good prices.

The Malaga market has revived, due principally to the fact that the shipments are now in keeping with the demand.

The light and steady offerings of Tokays have been the means of keeping a brisk and active market. Prices throughout the country on this latter variety are high and indications are that they will continue so throughout the season.

Offerings are being made for Emperors packed in redwood sawdust. Packing will not commence for ten days or two weeks but we anticipate the movement will not be heavy at

any time and prices will probably rule at from \$2.25 to \$2.50 per keg or drum f. o. b. California. Speculators will probably store a few cars in cold storage for the Eastern holiday demand but the price will depend largely upon the keeping quality of these grapes, which at this time cannot be determined. The following prices have ruled for the week:

New York.—Malagas averaged \$1.57; Tokays, \$1.75; Muscats, \$1.00; Bartlett pears, \$2.50; Clairgeau, \$2.10; Levi peaches, \$1.02.

Boston.—Tokay grapes averaged \$1.65; Malaga, \$1.35; Bartlett pears, \$2.55; George's late peaches, \$1.27.

Chicago.—Malaga grapes, \$1.39; Tokay, \$1.66; George's late peaches, \$1.00; Salway, 80c.

Total shipments to September 18, 11,824 cars, as against 9,721 cars to same date last year.

Special Livestock Market Report.

San Francisco, Sept. 20, 1916.

Cattle.—There has been no change in the situation during the past week.

Hogs.—The packers still complain of the lightweights being shipped in and some are offering premiums to encour-

age proper raising and finishing.

Sheep.—Shippers are attracted to the Eastern markets by better prices there.

Wool.—Defective is quoted 10 per cent lower and free staple holds steady at last week's figures.

Butter.
The export movement to England seems to be at an end, as local prices are getting too high, but there is still a very fair movement up and down the coast, with some exports to Pacific ports. This is keeping the arrivals pretty well cleaned up, and prices are steady to firm at about the former range. Supplies are coming in well.

Deciduous Fruits.
Local prices show very little change. The demand so far this week has been somewhat slow, and it is hard to realize the top figures on many offerings, but still there is no real weakness. Raspberries and huckleberries show a little more firmness. A few Oregon cranberries have appeared, selling at 10c per lb., and larger offerings are expected soon. Alexander apples are cleaned up, and bellflowers are slightly easier locally. In the shipping trade, the largest size is easier, but 4-tier stock is quite strong, owing to the preponderance of very large apples in the crop, which has run very largely to fancy grades. With reports of a high percentage of No. 2 stock in the East, the outlook is good. Bartlett pears are quite firm, and peaches are cleaning up well, with moderate offerings. Figs are rather easy. Seedless grapes are slightly lower. Persimmons are appearing, with the usual limited demand.

(Wholesale prices, San Francisco.)

Dried Fruits.
The dried fruit market throughout the country continues to show a gradual improvement, as the jobbers seem pretty well convinced that prices have passed their lowest point for the season, and are getting into the market for their requirements up to the holidays, if not for the entire season. The packers are accordingly taking hold more freely in the country, and most offerings are being rapidly disposed of. Apricots are becoming very scarce, and packers have raised their offers another half-cent, without bringing out any more stock than they can use. Figs continue as firm as ever, with the black variety a trifle higher, and there will evidently be a great shortage. Prunes show no further change here, but New York reports some large export sales, which tends to stiffen the market. The trade there, however, has so far been covering only nearby requirements. Country offerings are still large, but are quite firmly held. [Net to growers, bulk basis, f. o. b. shipping point.]

Apples, new crop	4 1/2@5 1/2c

Citrus Fruits.
At the New York citrus auctions Monday, September 18, fancy Valencia ruled higher on all sizes, the thirteen cars auctioned averaging from \$2.55 as high as \$6.40 per box. There was little change in lemons, the three cars auctioned averaging \$4.75 to \$6.30. The average on Valencia in Philadelphia on the same date was \$3.10 to \$5.25 and in Boston \$2.20 to \$4.20. Between 2200 and 2500 cars

remain to be shipped, and shippers look for these to be disposed of advantageously during the balance of September and October. The top grade of oranges is rather scarce, and local prices have been marked up again. Choice grapefruit also shows an advance, while all grades of lemons are easier.

Oranges, Valencia, fancy, bx	4.25@4.75
choice	4.00@4.25
Grapefruit, fancy	3.25@3.75
choice	2.50@3.00
Lemons, fancy	6.00@6.50
choice	5.50@6.00
standard	3.50@4.00
Lemonettes	3.00@4.00

Honey.
The honey situation locally is becoming a little easier, though prices are still well maintained. There is now plenty coming in for current needs, and merchants are not anxious to put in large stocks until the weather is cooler.

Horses.
The local market is rather heavy this week, as there was an auction of a big teaming and contracting outfit due to retirement from business, in addition to a sale of a large lot of all-purpose horses of light to medium weight formerly held by a local dealer. Interest has been rather slack, and it is difficult to make sales at full prices. Offerings in the country, however, are said to be light, and bargains are hard to find.

(Approximate values in San Francisco, based on auction sales.)

Hops.
Picking is now over in some sections, and the buyers are taking more interest in the new offerings, with slightly better prices offered. Sales in the Sonoma-Mendocino district are reported at an advance of 2c.

Sacramento	8@10c
Mendocino	10@12c
Oregon	8@10c

Groceries.
After a sensational decline of 75c per 100 lbs. on sugar early this month, local refiners have advanced the price 15c, and the market is rather firm at the new level. Coffee is firm with an upward tendency, and provisions are very firm. Alaska salmon has been nearly all sold by packers, and salt salmon is very high. Large shipments of codfish have arrived, but the outside demand prevents any easiness.

Publisher's Department.

"The Pacific Rural Press sells all of my hogs," writes R. J. Miller of Lathrop.

A. E. Balmer of Martinez writes us that: "I am pleased to tell you that my ads in the Pacific Rural Press have been highly satisfactory in results, both in volume and class of business secured."

This is the time of year when you should be buying books for winter study. We offer technical books, such as "California Fruits," "California Vegetables," "California Garden Flowers," "California Poultry Practice," and "California Hog Book." Send for price list on one or all of them.

Writing from Winton, Cal., Geo. L. Horine says: "I am just starting in the ranch game, having been here just a year, and have learned more good, practical knowledge from the Rural Press and four of your books than everything else put together. I am going into Durocs exclusively, and have a foundation of seven sows and a boar. You might be interested to know that my father and mother, starting in San Diego, county in 1888, swore by you as long as their ranch life continued, and that I am doing the same."

Our readers may have noticed in the daily papers that the print paper situation is becoming more acute each week. Many papers have been forced to suspend and others are cutting down the number of pages printed. With us here we are cramped for space to give the amount of reading matter that we wish after advertisers' demands are met. Next week we hope to print a 32-page planters' number, if our paper arrives from the mill—otherwise we shall have to confine it to 24 pages.

Beginning with our next issue, the time for receiving or discontinuing advertising in the Rural Press will be set forward from Wednesday noon to Tuesday evening, the reason being that our steadily increasing list forces us to put our forms to press several hours earlier in order that all papers may be mailed out of this city by Friday evening each week. Advertisers will please remember that their wishes will be catered to in the best manner possible when orders are received prior to Tuesday evening. Later than that we will not be responsible.

FRUIT TREES—Long on apricot, almond and pear. Fine, thrifty stock. H. A. Hyde, Watsonville, Cal.

WANTED.

WANTED—Young man, single, as partner in stockraising proposition in Monterey county. An opportunity for a party desiring to start stockraising with a small investment. As only a few hundred dollars will be required at start, to take interest in stock. If desired party can remain at present employment for a time. Box 230, Pacific Rural Press

WANTED—Young men and women to attend the Western Normal Course—Normal and Academic. The Normal Course gives an adequate preparation for teaching, at a great saving in time and money. Academic course gives practical finish to education. Write for Bulletin "A," Western Normal, 524 E. Market St., Stockton, Cal.

WE WILL PAY YOU \$120.00 for congenial work in your own community. 60 days or less. Man or woman. No capital required. Opportunity for promotion. Spare time may be used. Full particulars free. International Press, 302 Winston Bldg., Philadelphia.

POSITION WANTED—To take charge of a vineyard and orchard. Qualified by experience and agricultural college training. Straight salary; salary with dividends or share management acceptable. Reference furnished. Box 240, Rural Press.

AGRICULTURAL COLLEGE GRADUATE, with three years' experience in large orchards, open for engagement, October 1st. Box 228, Pacific Rural Press.

COUNTRY LANDS.

RANCH FOR SALE—50 head of horses and machinery. 2000 acres of rich, sandy loam land for sale, on the east shore of Washoe Lake, Nevada, between Reno and Carson City, 1000 acres being cultivated, in alfalfa, grain, and potatoes. The land is irrigated by a 400 H. P. Hydro Electric Pumping Plant, which belongs to the property, and the cost of pumping is less than 60 cents per acre. Fine cattle and sheep range outside of ranch property. Will sell this property as a whole or in small lots. Water right of 2000 inches goes with the land. Address W. G. Douglass, Virginia City, Nevada

MAILED FREE—A catalog of lands, containing a list of choice alfalfa and hog ranches; orange and lemon groves; suburban homes; little farms close to the city, poultry ranches; olive, walnut, apricot and peach orchards for sale by The James R. H. Wagner Co., Suite 200, 631 So. Spring St., Los Angeles.

WANTED—Farms, large and small, in all parts of the State. Our system of placing owners in direct communication with buyers has brought us hundreds of applications for farms. What have you to offer? Write for our listing blanks. Western Farms Bureau, 660 Market St., San Francisco.

FOR SALE—23.32 acre irrigated ranch planted to alfalfa and almonds. Good improvements; close to good town; high school; creamery, etc. Price, \$275 per acre. Owner going East. Antonio Medeck, Esparito, Cal.

INFORMATION free about State, Government land now open; different counties and States. Write your wants. Joseph Clark, 1511 K St., Sacramento.

LAND FOR SALE near Livingston. 10 to 80-acre tracts. \$100 to \$125 per acre. Address, Box 31, Livingston, Cal.

WANTED TO RENT an equipped dairy on shares. J. Hudson, 585 Market St., San Francisco, Cal.

The REMCO SILO

**Made of Air-Dried Redwood
The Standard**

Mr. A. L. L. Dairyman,
Everywhere, Calif.

Dear Sir:

What would you give for Green Pasturage the year around? If you had it you'd make a lot more money, wouldn't you?

You can have it or its equivalent, **THROUGH SILAGE**, at less cost in labor and money than through natural pasturage, almost without regard to seasonal conditions and dependent only upon your own efforts.

Corn is not the only crop for silage. Feterita, Milo Maize and Other Sorghums, Barley, Oats, Alfalfa, Vetch and Cowpeas all make good silage.

You do not have to wait until next fall to profit from a silo. Fill it in the spring with fall-sown grain or the first cutting of alfalfa, and insure against such losses as you had this season. Ask us about it.

President Ripley states
Sante Fe's position
on eight-hour wage law
and asks an important
question.

The Atchison, Topeka and Santa Fe Railway Co.

CHICAGO, ILL., September 8, 1916.

TO SANTA FE EMPLOYEES AND THE PUBLIC:

This is the position of The Atchison, Topeka & Santa Fe Railway Company regarding the controversy with its train-service employees over their demand for increased compensation:

Congress, hastily acting under a threat of four leaders of labor organizations, enacted a so-called eight-hour law, which is nothing more or less than an advance of twenty to twenty-five per cent in the wages of the best paid men in railway service.

It is only fair to our employees and the public to say that The Atchison, Topeka & Santa Fe Railway Company does not intend to comply with the law except as and when ordered to do so by the court of last resort.

The merits of the case have been fully explained in the last few months and need no further mention.

Should the courts finally decide that the increase must be paid, there will be an immediate demand from the remaining classes of labor, resulting in entire inability to pay without heavy increases in rates to be paid by the public—especially the farming class.

IS THE PUBLIC PREPARED TO MEET THE DEMAND?

This notice is for the information of all concerned.

E. P. RIPLEY, President.

What Fruits Should California Grow?

Fourteenth of a Series of Sketches in Which the Editor Presents Suggestions, Drawn From Long Experience, of What Californians Have Done and May Do for the Advancement of California Agriculture.

THE farther California advances in commercial fruit growing the more difficult, and at the same time the more important it becomes to answer our subject-question correctly. We are now producing each year fruits and fruit products, reasonably estimated to be worth more than one hundred and twenty-five million dollars at their points of sale beyond the State's border lines.

Though the foundation for this achievement was laid when our mountains, foothills and valleys assumed their present relations to each other and to the ocean and when our soils began to be formed from crumbling rocks and uncovered lake-bottoms; and though the chief agency for the development of our fruit industries was determined as soon as the population of California assumed the characteristics which the world recognizes as American, the achievement itself began within the memory of some who are now living and has attained its present dimensions largely under the observation of many who are now active in it.

In this rapid advance in production, from a meager amount, which left a few shiploads of gold-seekers in 1849 still hungry, to an output which now tops that of all single States and nations, there have been created changing points of view and purposes in production and distribution, which should be firmly fixed in the minds of those who now participate in the plans and practical operations of still greater development which is clearly reasonable and warranted.

First Purpose of the Pioneers.—Fruit growing was undertaken in California, by Americans and Europeans who came to the new State in the light of the gold-lure, with the same purposes which actuated them in their old homes, viz.: to supply their families and the local markets. The local demand must have seemed very large to those who planted the first trees, for not only was every fruit gathered for San Francisco from the old trees and vines planted at or near the missions in the previous decades, but every ship from southern coast ports, from Mazatlan to Chile; from Australia, Hawaii and all smaller islands of the south seas, and from the then open ports of the Orient, brought everything in the fruit line which could be undertaken with reasonable chance of arriving in edible condition. The first fruits of hardy trees then first coming into bearing in Oregon, were also seized by shippers who knew that gold was like dirt in the California

trade. From European and Atlantic ports also there came all kinds of cured fruits then in commercial standing. We have no space for adequate picture of this thrilling, world-seeking of fruits for California but perhaps one can grasp better realization of it when it is said that in 1853 twelve thousand barrels of dried apples were brought from New York at a cost of \$144,000. One who can remember the dried apples gathered from far Eastern farm kitchens sixty years ago surely needs no assistance to realize how hungry Californians must have been for fruit to yearn for them! This was the incentive to the first fruit planting by Americans; it was simply planting for the local demand, every kind of fruit which would grow and bear well, to make money and to displace importations.

A Patriotic Purpose.—But it was not long before the pioneers disclosed a patriotic purpose—to build a State, and they realize the relation of

horticulture thereto. Most people came to California to grasp gold and take it "back home" with them. How could they be held for service to California? In 1856 Col. J. B. Crockett, in the course of a public address, said this:

I consider it a very important matter to have apple trees for our boys to climb and green fruit for our little girls to stuff into their reticules; also peach cobbles, apple dumplings and cherry pies for old and young, because each one of these things inspires us with a home feeling and becomes a new bond binding us to the soil.

And in 1858, at a horticultural fair held in San Francisco, Wilson Flint gave this more definite declaration of patriotic purpose:

"It is to horticulture that every county is mainly indebted for its permanent prosperity: and, as an illustration of this, look at some of the best valleys in our State, where a land tenancy system of occupation prevails. There the population is nomadic, coming and going with the close of the harvest; having no permanent interest in the soil, a skimming cultivation is adopted, orchards are not planted, hedges planted, houses built fit for women and children to live in, nor does the transient citizen feel that identity of interest in the social and political welfare of the country which it should be his pride and ambition to foster."

The Pecan—Not Yet a Commercial Nut in California though It Makes Grand Growth, and, on Moist, Interior Low Lands, Bears Well.

Dawn of a New Conception.—The efficiency and energy of the pioneers and the precocity of fruit trees and vines under California conditions are both shown by the fact that the first fruit plantings suggested the danger of an oversupply of the local market as early as 1858, for Mr. Flint, in the address quoted above, also said this:

The subject of drying and preserving fruit so that there may be a supply throughout the year without importations and to enable you to become large exporters, should command earnest attention—as the time is rapidly approaching when our population can consume only a moiety of the pomological abundance which already is smiling around us. Our surplus crops must soon be turned to good account by shipment to the Atlantic and Pacific worlds.

EDITORIALS

THE WEEK.

W E PART with September with regret because this year the month has made a record well nigh the ideal of its agricultural efficiency in California and has merited our profoundest appreciation and gratitude. It has reminded us of its ability in water bringing and yet has been content to display its proofs thereof most amply in places where no harm could follow and most lightly where deterioration of exposed products would result. In this kindly consideration for human interests September has brought heat and dry air for the lengthening of the harvesting period and has only spurred the dilatory by the hints conveyed by dews and mists instead of punishing them with drenching showers and dripping fogs. And this behavior of the first autumn month should evoke deep thankfulness, for these heavier penalties are proper parts of her punitive repertory whenever the month decides to be more just than merciful.

We undertake in this issue to pay a tribute to the memory of this year's September by emphasizing her bright opening of the planting season. We would have none forget that great and varied as are California's producing industries and expansive as they all now are under the alert effort and free investment which they are now commanding from Californians new and old, fruit production is our greatest and most distinctive industry and the one which still has the greatest power and popularity in State-building. California will be great in all lines which make good work a joy and profit, but greatest of all in fruit growing. Therefore we give prominent place in this issue to matters of interest and suggestiveness in connection with fruit planting—endeavoring to draw from the rich and varied experiences of the past courage and wisdom for the guidance of the present.

HEADWAY IN FRUIT INDUSTRY.

W E HAVE had a summer of great things with fruits. We have made large products and we have had free outward movement at good prices. Nearly all the evils which have been threatened have passed in the night of foreboding. We can realize now that we should not have been depressed by the darkness which the timorous and the selfish tried to draw around us. We should have known that such darkness could not be realized under the stars which have arisen over Californian industries during the last two decades. We should have had more confidence that the pathway of our characteristically great and desirable products could not be blocked by embargoes, nor cluttered by lack of transportation nor obliterated by deficiency of purchasing power among those to whom we ministered. One thing we lost sight of for a moment when the unwise or the interested began to draw their shadows over our fruit products last winter and that was the headway which our fruit industries had acquired by the diligent enterprise of producers and the welcoming desires of consumers. The headway of our fruit products is born of the heart-way of the

world and when head and heart work together there is no greater force in industry, as in other human affairs. * * *

AMERICA WILL SUPPORT CALIFORNIA.

A NOTHER very profound lesson is deducible from this year's experience in fruit and fruit products, viz.: the elasticity and capacity of the American demand. We are just beginning to understand and appreciate it. It is, however, clear enough now that California has a treasure in the purchasing power of the great nation, of which she is a part, which is the assurance of our distinctive production if we decently try to attract and develop it. The efforts of the associations of citrus fruit and raisin growers to popularize their products have uncovered this treasure and disclosed, not the measure, but a prospect of its volume and value. All other organizations of fruit producers have now a clear way blazed for them toward the permanence and expansion of their production. Though perpetual motion is a fallacy in mechanics, there is something very like it possible in production and trade. It lies like four peas in a pod. It is organization of producers for Production, Purveyance and Publicity Perpetually. And the prolonged operation of the policy, which these four words involve, is based upon the surest thing in the world today, viz.: the progress of the United States of America. We have today more than a hundred million people who are only beginning to know our fruit products. We have still to enlighten on this subject a constituency which is growing almost at the rate of the population-outfit for a new state every year—if we average the States away from the very old north-east corner of the country. And these multiplying millions are to live in regions which are by nature forbidden to produce for themselves the delicious things California will bring to them as rewards for the industries which they develop and extend. And to think that we have been so long peddling out to these millions only such amounts of such products as could filter through old trade channels automatically narrowed by the old commercial precept: "Sell as little as you can for the money, to reduce risk and insure profit." It is the joint producers' and consumers' interest to abolish this old traders' conception and enforce the policy to "sell as much as you can at a profit above cost of delivery." The moving force in this policy, which will ensure the fullness of the development of California's resources, is organization of growers for Purveyance and Publicity.

WORLD'S INTEREST IN OUR PRODUCTS.

O F COURSE we are not unmindful of California's interest in world trade though we have tried to throw great emphasis on our American opportunity and our duty in connection with it. We take it for granted that our fruit products will command the attention of the nations as they previously have and even more abundantly. We emphasize our own national opportunity because it has never been properly appreciated nor striven for on our part and because our right to possess it has been practically ignored by those who recently gained political power by exaltation of economic fallacies which have neither supported the government nor helped American producers as it was claimed for them. It is not likely that the country will call for farther experimentation along that line. Whichever political party wins in the coming election we are likely to have rational protection for American industry so that American production shall be protected from competition with un-American standards of living and citizenship. We must have this if the United States is to proceed to realize its destiny and its loftiness of world service. And when the next Congress shall insure that, we shall occupy a position of self-respect and influence in the world. This will enable us to develop to its fullness the policy of fair trade with American consumers and of publicity to inform them of our desires thereto. It will also enable us to command such world trade as we can compass for the superior products which we can profitably export—for we have no desire to compete with the low standards of the world's average products of similar kinds—either in this country or abroad. As soon as we get pro-

tection at home and such opportunity abroad as our product will command for itself, our fruit industries will assume new stability and confidence because this country is not like to repeat the crazy economic experiments of the last three years for a considerable period—perhaps for generations. * * *

WHAT FINANCIERS SAY OF THE FUTURE.

L EST some of our readers, through hard-headedness and heartedness, may think some of our inferences and arguments sentimental and unbusinesslike, we support our positions by references, for which such readers should have particular respect. We have previously alluded to a great canners' merger which now declares itself to possess \$19,500,000 in net tangible assets and whose sales of products during the current year are estimated at \$35,000,000. The common stock of the combined concern is priced at a figure on which the net earnings of this year would return 14 per cent. This figure of profits has a largeness which we apprehend but perhaps do not understand as well as a business man would. We seem, however, to understand better when we come to such plain English as this:

The new company will be engaged in the preparation of food products on the Pacific Coast where it will rank as the largest factor in a basic industry of staple character, with a market for its products throughout the United States and all important foreign markets. The growth in volume of business during 1914 and '15, while substantial, was retarded by the European war. While domestic business has become normal again the export trade is still unfavorably affected by the shortage of marine transportation, and a further substantial gain in sales is anticipated upon the cessation of the war.

There seems no sentiment in the above declaration in favor of this combination. We may have to invoke sentiment against it some day, but at the moment we accept it as evidence that fruit canning (chiefly) is held to be a "basic industry of staple character" to such an extent that financiers are ready to blow millions into it and expect not less than 14 per cent gain upon the present price of admission tickets. How much more gain they will get we do not know, but this is enough to prove that even though the figures of the present are large, these business magnates are building upon fruit production as a greater industry in the future.

GLADNESS OVER GREATNESS.

B UT though there is doubtless a lifting of plush waistcoats as these merging millionaires think of the future of the California fruit industries as the basis of their investments we doubt if they get so much uplift of soul from their end of the business as the fruit grower does from his, when his trees grow and bear well and the selling price fills his home with the comforts of the simple life. And of course it is the widespreading of the latter human joy which is of the greater moment to the State. It is for this that the California fruit growers are striving more intelligently now than ever before in their history. It is for this that they are constructing co-operative organizations which are new in their particular purposes and methods of work. And it is largely upon the confidence which such organizations have engendered that this year's plantings will be large and more definitely directed than hitherto. It is for this kind of planting that we have tried to demonstrate, on other pages, that the planter should keep his ear close to the ground of commercial suitability in the new settings which he will make this year. This is the way to be practically glad over the new greatness which is coming and to make its realization more sure. We believe our nurserymen, who have suffered more or less from the distractions of the last two years, will this year find good demand for all the well-selected and well-grown stock they have to offer, if they bring it early to the attention of planters. Buying and planting fruit trees should be carefully and leisurely undertaken. It is a mistake for both propagator and planter to have the selection left to the last month of the planting season, as is too often done. It is a thing to talk about and write about and think over and to get

every detail well arranged for the investment and the work. Be sure you understand the characters and achievements of your district. Study the requirements of the canners, shippers or driers who may be the buyers of your fruits. Consult the officers of the fruit association with which you ought to be affiliated. Go to the local conferences of fruit growers in your district. Read the books

and papers which bring to your consideration the methods and experiences of others. It is an advantage to be widely wise about any business in which you are engaged. It may make a shallow man shifty, but it deepens a man who has capacity for the exercise of judgment. And this it is which brings to a human soul a gladness which is over greatness.

By
the Editor

QUERIES AND REPLIES

Inquirers Must
Give Full Name
and Address.

Potatoes Failing.

To the Editor: I send a piece of potato vine showing discoloration of roots and lower stem. These vines died shortly after the bloom seemed to lack water even when ground was moist. Another trouble was that in some hills the seed pieces remain unused. Some hills were almost as planted and in others only part started. What is this trouble? What is the cure? Will the potatoes from such hills do for seed?—L. C. R., Grass Valley.

The specimen piece was too dry to warrant any impression about it except that it was dead. It seemed however to have no abnormal forms or colors. The appearance, coupled with your notes, suggests that the planting was too late, for the soil moisture. When a plant seems to lack water at the blooming it generally does lack water and an appearance of moisture is not enough. It is often the case that a grower trusts too much to a "show of moisture" without the substance thereof. The failure of the seed to start looks the same way. The soil was probably too dry to start the seed; also too dry to rot it. What good potatoes you do get would do for seed if they have strength enough to make good eyes.

Probably a Different Alfalfa.

To the Editor: In my field of alfalfa one-quarter was seeded with seed purchased for Surprise Valley seed, one-quarter was Utah seed and one-half was just alfalfa seed. The Surprise Valley seed has always been, from the start, so vigorous and quick to start after cutting, that in one week it is equal to the others at two weeks and holds that lead all the time, though it does not mature or make hay in less time than the others. The yield, however, is always from one-fourth to one-half more. I can see no difference in the shape or size of the leaf. The stem is not hollow. The soil conditions are exactly the same. Is it possible all this difference comes from good strong seed, or is it a different variety of alfalfa? This field is five summers old.—F. W. M., Orland.

Our opinion is that it is a different variety of alfalfa because it does not seem to us reasonable that a different degree of strength in the seed would hold through five years of uniform conditions—supposing that the stand is similar in both cases. Then a mere difference in the seed would not cause the different habit of growth which you note by its quicker, stronger start. The slowness in haying also indicates a different character of growth.

Raspberry Borers.

To the Editor: In digging up raspberry vines I find the roots badly infested by "borers." Is it safe to plant in the same place in the spring, and if so, should the soil receive any treatment, and what kind?—H. R., Berkeley.

If you dig up and burn all the plants you will destroy the larvae; and all the insects at this time of the year are in that form, inside the tissues of the infested plants. Therefore it is not necessary to treat the soil in any killing way. The re-infestation will come from February onward through eggs laid by clear-winged moths which begin to come from pupae in the old plants at that date or a little later. The same pest freely inhabits the root crowns of strawberries and to some extent of blackberries also, so your chance of getting more next spring or early summer is pretty good. The grubs can be killed by making a pond around the plants and holding the roots under water for four or five days.

Curing Citron.

To the Editor: Please tell how to dry citron as we buy it in the store. I have some which I have tried to dry, but have not succeeded as they all dry up.—Subscriber, Los Molinos.

The cured citron of the store is not a dried fruit—it is a candied fruit. The fruit is placed in barrels of brine for a month, the brine being changed

several times. The fruits are then boiled in fresh water to soften them, when they are halved, the seeds and pulp removed and the thick skins are put into cold water to take out green color. They are then put in syrup and allowed to soak for about three weeks in earthen jars. They are then boiled in heavier syrup, allowed to cool and dry until they assume the character seen in the commercial article. This is an outline of the foreign process. We are not aware how much it may be shortened, but probably very much. All this is the method with the true citron which grows on a tree like a lemon. Of course if you happen to refer to the "citron melon," that is not a citron at all and cannot be cured as such.

Vinegar Making.

To the Editor: Where can I find out how to make cider and vinegar from apples, and wine, also? Is it possible to make wine from grapes that are not regular wine grapes?—J., King City.

We have given these processes in detail in earlier issues. The easiest way to get information, both of domestic and factory processes, the principles upon which they rest and the appliances which they employ, is to send to the Experiment Station, Berkeley, for Bulletin No. 227, entitled "Grape Vinegar." The processes described are applicable to all fruit juices. Wine and wine vinegar can be made from all kinds of grapes, but the kinds of wine will range widely in character and quality. Wine grapes are simply varieties which have been selected for wine-making because their contents and relations of sugar, acid, color, flavor, etc., enable the producer to secure characters held to be desirable in different types of wine. Grape varieties differ so widely in characteristics that some are exceedingly desirable and some very inferior for wine-making.

Gophers and Poison Signs.

To the Editor: I have some alfalfa that I irrigate in checks and the gophers simply riddle the levees, which are pretty wide and low and give them quite a bit of dry ground to bore through. As my place is not fenced in, would it be legal for me to put a poison out providing I put signs out? If so, how many signs would I have to put out to be lawful? How would a squirrel poison that was printed in your issue of Sept. 2nd (page 238) work on gophers?—Subscriber, Corning.

A judge who is onto his job never decides more points than necessary to get rid of the case and so we get rid of the signs by deciding that there is no use putting out poison for gophers so anything else can get to it. Use a sharpened piece of a shovel handle or some other similar prod and punch around until you get into a main runway, about a foot below the surface of less. Drop the poison into that runway and cover the hole you make with a clod. There is little use trying to poison gophers by surface scattering. The squirrel poison you mention will kill gophers if a few grains are dropped in their runs, but it is better to prick the powdered strychnine into pieces of fruit, alfalfa stems or something else that is juicy and drop them into the runs.

Irrigating Fruit Trees.

To the Editor: I have a number of fruit trees such as pears, peaches, walnut, almond, etc., planted on each side of the driveway and irrigate them once a week. They are growing finely but a party tells me my almond trees would die, as they can't stand as much water as fruit trees. Is that true? The trees are two years old.—K., Sacramento.

Unless you are growing trees over hardpan there is no necessity of irrigating so often. Sometimes on a shallow soil it may be desirable to water very little and often. If you have good soil of fair depth the trees you mention ought to make good

growth with water not less than once a month in summer and if well cultivated need hardly be irrigated at all. Almond trees like water as well as others, though they need it less, because they root deeper when they can, but they cannot stand in the mud as well as some others can. Therefore, if you are using too much water, the almond may be the first to tell you about it, as your party advises you.

Connecting Apricot and Almond.

To the Editor: You told me some time ago that the apricot could not be trusted on the almond, but I had already planted seedling almonds, and I wish to make a top growth of apricots without taking them out. I think of making some kind of middle tree which will do well on almond and do well for apricot. Do you think myrobalan will do or not? If not, please tell me what kind of tree is good for middle almond and apricot.—Y. S., Winters.

Myrobalan would be doubtful because it is a slow grower, and you might have a tight piece of wood between two free growers, which might enlarge both above and below it, and make a bad union. This is a theoretical view because we have never seen that kind of double working. We do know, however, that the peach unites well with both apricot and almond, and makes about the same free growth. Therefore, we would use the peach but still, considering the loss of time and the cost of double-working, we should consider it better to snake out the almond seedlings and plant good apricot trees on a proper root.

The Apple Worm.

To the Editor: What would you advise to spray pear and apple trees with to kill the worms that eat the fruit? When and how many times should I spray?—A. J., Turlock.

Spray next spring as soon as the petals fall from the bloom, with lead arsenate two pounds to fifty gallons of water, using a good pump and nozzle making a fine mist which must reach the leaves and all the young fruits. Repeat spray each two weeks for four times in all.

Wild or Alkali Heliotrope.

To the Editor: I send a weed which seems hard to get rid of. It keeps coming up just as often as I cut it off. I would like to know how to get rid of this weed. Does it come from the seed each year or does the root live in the ground over winter, like Johnson grass?—Reader, Winton.

[Answered by Prof. P. B. Kennedy.]

The plant is Alkali heliotrope (*Heliotropium curassavicum*), a native of the Western States, and most commonly found in alkaline situations where the water-table is near the surface, or where there is seepage from irrigation canals. From such places it spreads to the grain fields, even when only small amounts of alkali are present in the soil. It is a relative of the cultivated heliotrope of the gardens and resembles it to some extent, but lacks entirely the delicious fragrance. The stems and leaves are quite succulent and the perennial root creeps not unlike morning-glory. On the approach of frost in the late fall it gradually dries up and turns black. The chief objection to the plant is that it remains green and succulent in the grain fields at harvest time and clogs up the machinery. Its seeds are also a common impurity in seed grain. The sprays of flowers vary from white to purple. No definite experiments have been carried on to determine the best methods to eradicate it. Ordinary summer fallowing does not kill it. The patches would have to be treated frequently with a hoe or weed cutter, so as to prevent the formation of leaves. The underground rootstocks would then succumb due to the lack of starch-forming ingredients secured from the air through the leaves. Another reason for its persistence is the fact that stock do not care for it, and hence it is left undisturbed to multiply abundantly.

California Weather Record.

The following rainfall and temperature record is furnished the PACIFIC RURAL PRESS by the United States Department of Agriculture Weather Bureau, at San Francisco, for the week ending at 5 p. m., September 26, 1916.

Peach Growers' Business Booming.

[Written for Pacific Rural Press.]

The California Peach Growers Inc. is fighting to keep its head above the inrolling tide of dried peaches from its members; and still the volunteer contracts come in, about 75 new growers having signed up without solicitation in the first two weeks of September according to Mgr. A. L. Sunderland.

The Association is paying 5 cents orchard run in the sweat box, to growers; and when they shall have been graded and sold, each grower will be paid according to the quality of his peaches. Those who are holding back their crops at request of the Association, which has no room for the tremendous deliveries, are being financed by the peach belt banks who make loans on orders signed by growers directing the Association to repay the loans out of early deliveries.

Eleven thousand tons of dried peaches had been delivered by the middle of the month; all available warehouses were full up, three Fresno warehouses were rented and full, all the sweat boxes which growers would leave are stacked up in the yards of the receiving stations all over the State. At Kingsburg, with a grader of 35 to 40 tons capacity per day, 125 to 175 tons per day are being delivered. Growers are wanting their sweat boxes back as soon as possible, to use for raisins.

Sales were very satisfactory on the opening prices and a list of advanced prices put out Sept. 6 has brought many new orders. We saw one order for 80,000 pounds, which came Sept. 14. More peaches have been sold than the Association expected, to date. It is expected that outside peaches must all be sold first, because of their lower prices.

Peach orders used to be for solid cars of peaches, but of late years the tendency has been to take them in assorted cars of raisins, peaches, and other dried fruit. This year over 85 per cent of orders to date are for assorted cars. This is a large reason why deliveries to Eastern buyers are not being made faster, since they must wait for raisins. Two grades

have been eliminated by the Association, thus raising the sizes in the remaining four grades.

The Cal. Peach Growers do not expect to force orders—they intend to await the consumer demand, which is not to be demoralized by packing a lot of peaches to rest on retailers' shelves a long season and perhaps spoil. It is better to process and pack dried peaches shortly before they go into consumption. Meanwhile they are stored in sweat boxes or in sanitary bins after grading each grower's lot separately. Prices are named to the trade which bring the desired returns to growers, and yet do not raise consumers' prices.

Growers as a whole are standing up to their contracts in fine shape, according to Mr. Sunderland. There are some who have grievances or think they have, but the hardest kicks come from those who have cured by the old careless methods, making dark slabby dried fruit or chunky green fruit, both of which are hard to sell and are paid for as lower grades or rejected. Those who cannot deliver on account of lack of storage facilities this first season, are taking their lot gracefully with the financial arrangements mentioned.

Opening prices to the trade were lower than outside California packers expected, so those who contracted at high prices this spring are rejecting all not strictly up to specifications. Many of these are offered to the Association, which rightly refuses to handle them unless their owners sign the three-year contracts.

The Peach Growers' Warehouse Co. was incorporated Sept. 9, with a capital of \$100,000, to make legal the issuance of negotiable warehouse receipts. The Cal. Peach Growers Inc. will lease all their own and subsidiary warehouses to this subsidiary company, which will then issue to the Cal. Peach Growers the desired warehouse receipts for fruit stored in them. Directors of the warehouse company are Wm. Glass, Wylie Giffen, W. B. Holland, Ray Humphries, and A. L. Sunderland.

Gros Colman Grape and Its Aliases.

[Written for Pacific Rural Press by Prof. F. T. Molett.]

It is not always easy to determine the correct name of a grape. It is probably impossible to adopt the law of priority adopted in botany, but it is very desirable to have but one name or at least as few as possible for a single variety. Perhaps the best rule to adopt, and that which is most commonly followed, is to take the name used in the region where the variety is cultivated most extensively. This is the only justification of the name Tokay for a variety which is grown on a large scale only in California. This grape has nothing to do with Tokay, and the grape from which that famous wine is made has no resemblance to it.

In introducing a new grape, this rule can usually be followed, but there are sometimes difficulties due to limitations in the flexibility of the human tongue. These difficulties are perhaps exaggerated for we have adopted without serious incon-

venience such names as Feher Szagos and Petite Sirah, though they are occasionally corrupted or improved to "Fair" and "Pretty Sarah." The adoption of the name of Rupestris St. George was due to fear of this difficulty. Its commonest name in the regions where it is most grown is Rupestris du Lot, but the pronunciation of this word and of most of its other synonyms offers almost insuperable obstacles to the Anglo-Saxon organs of speech. The College of Agriculture, therefore, after mature deliberation, decided to adopt St. George in its publications and the stock seems to succeed about as well under this cognomen, though it is one of its least commonly used.

When we have adopted a name it is very difficult to change it, so it is very desirable that we adopt a suitable one and stick to it. When a variety becomes popular rapidly its first christening is usually per-

manent. When it is tried many times in many localities with only partial success it usually acquires a large number of synonyms before it finds its useful place in our vineyard.

A variety which exemplifies the last case is the Gros Colman. This variety is grown sparingly or largely from the Southern Caucasus to the hot-houses of England. According to Goethe, it possesses 13 synonyms, while Molon lists 25. In the Caucasus, where it appears to have originated, it is called the Dodrelabi. In Belgium, England and Northern France, where it is grown largely in hot-houses, it is called Gros Colman.

This grape is of very fine appearance, very large, round and black, in large bunches. It is crisp and agreeable to eat and with care can be shipped. Gros Colman from Belgium was commonly found in the markets of New York and other Eastern cities.

Twenty-five years ago this variety was tried in Sonoma, Napa and other

coast counties, but was abandoned because the grapes nearly always split open just before they were ripe enough to gather. Lately it has been discovered that it succeeds admirably in certain of the warmer sections, but most of the growers have lost the original name, or have preferred a new one. From one locality it is shipped as the "Queen," from another as the "Big English" and lastly it is being advertised as a new variety under the name of the "Servian Blue." It seems desirable to stick to the name of Gros Colman, by which it is known all over the world, and to which its reputation is attached.

It promises to be a good commercial variety for the hotter localities. It is very vigorous and bears well with short pruning. It becomes firm, dark colored and very sweet in the San Joaquin valley and other hot regions and ships almost as well as the Malaga. In the coast counties it is usually unsatisfactory even for home use.

Raisin Growers Happy.

[Written for Pacific Rural Press.]

With the biggest raisin crop ever marketed (that of 1915) entirely sold, and all out of the California Associated Raisin Company's hands before the 1916 crop commences to come in, raisin growers are happy over the market prospects. They believe that the Associated's past record justifies the expectation that any crop that may be raised on present acreage may be marketed at high prices to producers and no advance to consumers.

Growers are more optimistic than Manager James Madison of the Raisin Co., who says that he would discourage further planting because he believes that any larger crop could not be marketed. He says that no raisins are being exported now on account of unsettled commerce on the seas, but that only about 10 per cent of the 1915 crop was exported.

With the biggest, cleanest crop of exceptionally well-matured raisins now on the trays (mid-September), with very little mildew or disease of vines in the State compared with what there might be, and with an

assured market for all that is produced, at very profitable prices cash to the growers on delivery, the great majority of growers are looking up with greater hopefulness than ever before.

Great numbers of raisin growers are also peach growers; for Fresno county is not only the greatest raisin county in the State, but also the greatest producer of peaches. Now their peach crops, which were very fair in quantity and fine in quality, are assured of a market at prices undreamed of by most of them a year ago. Most of the raisin growers also have Malaga vineyards. They have produced one of the finest crops ever, which is selling in the East at over \$1 a crate net to the grower in many instances.

The greatest trouble of raisin growers has been to get trays. Many are begging for a chance to buy paper trays at \$9 per thousand. All the wooden trays are in use. Everybody not picking grapes is making all the new wooden trays he can get material and time for.

MAGNIFYING GLASS SAFE.

[Written for Pacific Rural Press.]

Most progressive citrus growers are getting the habit of carrying a pocket magnifying glass. With it they can detect the earliest red spiders—can with more certainty tell whether scales are alive or dead and thus estimate the percentage of kill by spraying or fumigation. J. C. Perry of East Highlands carries a good one. To reduce chance of loss, he has made a little cloth bag for it. A string to the inside of the bag secures the glass. With the bag, the glass is less likely to drop out of his pocket; if it does drop among the cover crop, it is much easier found; if some one else finds the glass, it may be returned, for Mr. Perry's address is on the bag in ink.

SWEET CLOVER FOR ORANGE COVER CROP.

[Written for Pacific Rural Press.]

Fine germination of sweet clover seed in a 13-year orange orchard has been obtained for four years by J. W.

Cassada of San Bernardino county. After preparing the seed bed early in September, he irrigated the 10 acres about Sept. 1, 1914, through four furrows per row, leveled the furrows with a four-shovel cultivator adjusted to fit them, broadcasted by hand 10 pounds of seed per acre, cultivated it in with a 9-shovel cultivator working a strip about 5 feet wide, cross cultivated it, then furrowed for irrigation. It came up two weeks later, first in the moist spots.

There was no fall rain in 1914, but 30 inches of irrigation were applied to the 10 acres for 48 hours Oct. 11, Nov. 11, and Dec. 11. Something, probably hot weather, thinks Mr. Cassada, prevented much of the crop from developing in 1914, though during the two preceding seasons fine crops had grown. About Feb. 1 it was 15 to 18 inches high when plowed under.

Mr. Cassada writes: "I sowed sweet clover a month later last fall, on account of hot weather, and got a fine stand. Most of the ranchers around here sowed some."

Los Angeles County Fruit, 1915-16.

[Written for Pacific Rural Press by Deputy Horticultural Commissioner B. R. Jones, Los Angeles.]

Replying to yours of September 8th, while our figures are not strictly accurate, which is quite a difficult thing to attain, we believe we have it more nearly than anyone else in the county, and are not far wrong.

The following acreage has been set out the past season: Oranges, 3,536; lemons, 1,145; peaches, 550; apricots, 400; pears, 1,250; apples, 560; walnuts, 4,000. As you will no doubt note, these plantings are not nearly as large as they have been in some former years. The low ebb of the real estate market has had something to do with this, as a great many tracts were set out formerly with the idea of bring them to an age when the grove would be considered well established, and selling them to parties who wish to make homes upon them; this more especially, of course, applying to the citrus fruits and walnuts, also pears in the northern part of the county, where excellent returns are being obtained from that fruit.

Citrus.—On the whole we have had a very good fruit year. Our citrus returns have probably been the largest of any year with the possible exception of 1910. Roughly speaking the citrus shipments have reached very close to 50,000 cars for the State, and our county has produced about one-fourth of them. The average price for oranges and lemons was \$2.28 per box, f. o. b.

Los Angeles.

The Exchange has handled a much larger proportion of the fruit produced in the State than ever before; and in our county they handle probably a larger proportion than in any other. The Fruit Growers' Supply Company, connected with the Exchange, through its ability to furnish supplies of various kinds to the growers at a lower rate, to the amount of some \$4,000,000, has been an efficient factor in bringing the growers into the Exchange.

The walnut crop is considerably lighter than last year, perhaps 70 per cent of last year's crop. The price promises to be considerably higher, and possibly the receipts will be as much as for last year's crop, which was a bumper one.

Pears.—Our comparatively small acreage of pear orchards has for a number of years been very encouraging to growers, as the fruit produced has proved excellent as to keeping qualities; and was all taken by the fresh fruit markets, practically none of it going into canneries. Some little trouble was this year experienced with the blight, but the crop is perhaps 80 per cent of an average, and they are not feeling discouraged.

Other Fruits.—Apples have been a good crop, and prices about an average. The stone fruits, however, have been light, particularly apri-

cots and plums. However, our acreage is comparatively small of these fruits, and they do not cut a great figure in the financial returns to the growers. Prunes and grapes are of very little importance in the county, but the latter were a good crop where grown. Berries of all kinds yielded well, and prices were about an average.

Following is a statement of the number of trees and yield of the different fruits for 1915, as results have not been compiled this year, but it will give you a fair idea of the county's production:

Oranges:	No. of Trees	Total Crop
Navels	1,574,966	3,047,169 boxes
Valencias	1,322,230	1,336,473 boxes
Seedlings, etc.	231,758	281,111 boxes
Lemons	812,317	752,229 boxes
Berries (acres)	5,248 1/2	404,189 crates
Apples	202,024	337,176 boxes
Apricots	193,620	12,765 tons
Grapes	529,016	13,613 tons
Olives	162,524	2,070 tons
Peaches	681,955	22,819 tons
Pears	279,451	1,233 tons
Plums	109,672	145,522 boxes
Walnuts	386,848	99,521 sacks
Strawberries	2,520	1,768,620 crates

FRUIT FOR HILL LAND.

To the Editor: I have ten acres in fruit in our foothill country. The ground lacks humus very much, so I am thinking of planting a cover crop of melilotus. Would you advise mixing slaked lime with the seed? We blast for every tree on account of hardpan. Would you advise prunes or apricots in that kind of land?—V. E. K., Sacramento.

If your hill land shows an acid reaction when tested with litmus paper (which can be secured at any drug store) we would advise slaked lime, or ground limestone, which will be all right planted with the seed or before or after, provided you get it well into the soil where it is to do its work.

Since you have hardpan, the chances are there are some sour spots. Apricots do well on your kind of land, but we do not know of any extensive planting of prunes on such, though the red hills of Flacer county are the greatest plum-producing section in the State. Plums and prunes are the same, except that some varieties of sweet plums which have skins allowing them to dry without fermentation, are called prunes.

In blasting, do not leave a hole which will fill with the winter rains and not be drained out, for that would be worse than not blasting at all.

IMPROVED SEED BED.

[Written for Pacific Rural Press.]

"I have just finished plowing 1100 acres, and gave it such a plowing as it never had before," wrote G. W. Hamilton of Stanislaus county last April.

He pulled 120 inches of plows with a 75-35 tractor, turning the dirt 9 to 12 inches deep. He averaged 45 acres a day, working day and night with but two stops of half a day each.

Then he hooked onto three eight-foot double disks with 24 feet of harrows behind them, and the tractor walked off with them over the soft ground.

The plowing tore up the plowpan, while the prompt and thorough cultivation prepared a seed bed that will show results in old-time crops.

By a vote of about 8 to 1 the Waterford Irrigation district has voted bonds in the sum of \$465,000 for the construction work of the new district and to pay the Modesto district for water from its canals.

Mermaid Spray Powder

FOR CITRUS AND DECIDUOUS FRUIT TREES

ANALYSIS:—Curd Soap, 50%; Bicarbonate of Soda, 0.5%; Carbonate Soda, 37.5%. Balance Moisture.

FOR ALL ORCHARD PESTS.

SOAP SPRAY—An effective soap spray used in the proportion of one pound of powder to six or eight gallons of water with 200-pound pressure. Not harmful to trees or fruit if properly used.

ERADICATES SCALE.

MERMAID SPRAY POWDER will kill this form of pest when applied conscientiously with the above proportions at the right time. You will also note its effectiveness towards reducing red spider while spraying for scale.

COST—A cheaper and purer soap powder that is prepared with accuracy. Not the cheapest—but the powder that does the work.

UNIFORMITY—Guaranteed to be at all times uniform and without lumps and to dissolve with absolutely no waste, thus saving time and money by not having your spray machine stopped to clean out impurities.

IT WILL PAY YOU—to investigate Mermaid Spray Powder, and to use it, no matter how large or small your orchard.

WRITE US TODAY

We will cheerfully give reference from Professional Sprayers and Growers throughout Southern California who have tried all other Powders and have found MERMAID SPRAY POWDER without an equal.

"Spraying Makes Healthy Trees"

Thrips-Scar Peaches and Quinces.

[Written by Edw. O. Amundsen, Placer County Farm Adviser.]

In a recent issue of the Pacific Rural Press I noted an inquiry from Arroyo Grande relative to scarred peaches. In your reply you said that the scare were probably due to the attack of an insect.

If the trouble is of the same nature as that of the peaches and quinces which I am sending you, possibly the following observations may be of some value:

In orchards which had been badly affected last year I observed the adult winged thrips busily traveling in and out of the buds early in the spring. Very soon the young thrips in large numbers were found in the heavy bloom of the young fruit. Where the thrips were found small scare could be seen here and there under the bloom even when the young peach was not bigger than a pea. Later these small spots make big scars. The thrips feed by rasping through the skin and then sucking the plant juice. Early blooming quinces as well as peaches are affected.

One very important fact has been brought out all through the season. Weeds and thrips always go hand in hand. That is, weeds through the summer season. Orchards cleanly cultivated during the summer are not affected. In many instances the fruit is scarred on the trees along weedy fence rows or ditches while the other parts are free of weeds and produce perfect fruit.

The thrips very evidently must have certain weeds upon which to feed during the summer and fall; they do not travel very far.

Live thrips of various ages may be found at the present time in affected orchards on "wild lettuce," Johnson grass, bur clover, alfalfa and other plants.

Some of the young thrips found at the present time have reddish spots which were not observed on those found early in the spring. This may be a characteristic due to the climatic conditions or they may be of another species. The adults, however, are the same found earlier—almost black in color.

This is becoming a more serious problem in Placer county each year. The canneries condemn large quantities of clings on this account. Last year some Levi Cling orchards were total losses—not a peach free from

scars. Judging by observations since I arrived in the county (Aug. 18, 1915) the surest method of control would be to have absolutely clean cultivation during the summer. However, I would not guarantee the results until after thorough demonstration which would require at least another year.

Even if the weeds were eradicated now some of the adult thrips might live and deposit eggs in the blossoms next spring. It may be possible to control with a spray and this will be tested thoroughly.

[Mr. Amundsen sends specimens of the thrips' work he describes. The fruit is not only pitted and scarred but deformed, contorted and, in the case of the quince, hardly recognizable as that fruit.—Editors.]

POINTS ON VINE PLANTING.

To the Editor: Part of a block of Emperor and Malaga grapes in Fresno county was not planted last spring, the hot weather coming before all the work was finished. The vines which were not planted were heeled in and irrigated. The plan was to plant as soon as the rains come this year. What of these vines set this time of year? Will the roots start and grow the coming winter or will there be danger of the roots rotting? Will the plants that have been heeled in this summer do as well as vines planted next spring? What is the average age of grape vines on own root before phylloxera make the vines unprofitable?—D. S., Brockton, Mass.

[Grape vines are planted in California from the time the leaves fall in the late autumn to the start of new foliage in the spring. The planting therefore depends not upon any particular date but upon the dormant condition of the vine and a condition of adequate but not excessive moisture in the soil. At this time the vine is not yet dormant and the soil is still dry (except where irrigated) and there is no planting of vines now. When the vine loses its leaves and the soil is properly moist, transplanting can begin and there will be a start of new rootlets before the buds swell and no rotting of roots. But too much cold water in the soil might cause such rotting, if the soil did not drain well, and it is therefore the practice to plant out, in districts of considerable rain, after the heaviest rains are over and

For Sure Crops and Big Profits Plant the LOSSE APRICOT

The finest apricot for hand, drying, and canning that has ever been introduced to the fruit-growing world.

A prolific producer. Large and uniform in size. Highly colored. Flesh is sound and firm. Exceptionally small pit.

The Losse is a vigorous grower and will succeed wherever apricots can be grown.

We can furnish this superior strain on any root desired. Place your order now.

GOOD, HEALTHY, SOUND TREES OF ALL VARIETIES

No matter what kind of fruit trees you want—it will pay you to get into touch with us. Our trees are all grown on NEW LAND—that's why they are always clean, healthy, thrifty, and sure to grow and give satisfaction.

NOW IS THE TIME TO ORDER. If prices advance, we will give you the benefit of present quotations. If they go down, we will give you the benefit of the drop. This is the cheapest place to buy good stock.

the soil begins to warm up a little, which is in February—though in districts of small rainfall, January is also a good month and December may be used to some extent. In all these cases, the vine does not start top growth until heat is adequate in March or April, according to the local conditions.

Vines that have been heeled in and decently cared for will grow as well as those planted out the previous year, but will usually be a little behind them in growth and bearing for a year or two. If, however, the planted-out vines have been neglected and the heeled-in vines well cared for, there will be little difference—in fact the latter may be better in the second year. Everything depends on conditions and treatment rather than upon a season's difference in position.

None can tell the time required by the phylloxera to ruin a vine. It depends upon the character of the soil, the relative resistance of different vinifera varieties and the treatment given the vineyard. It might vary from five to twenty years.]

NEVADA STATE FAIR.

The State Fair held at Fallon, Nevada, the week of Sept. 11th, was quite a success, though the separation into different fields of the agricultural exhibits, the race track and the love stock, was not to the best interests of exhibitors. In the agricultural pavilion there were shown fine samples of apples, pears, grapes, and plums, raised by C. G. Swingle of Fallon. A big feature was that of the boys' and girls' club work in garden and animal husbandry lines. In live stock the University of Nevada showed Hereford heifers that commanded the admiration of Nevada stock men. Jos. Wilson, Jr., of Mason won 11 out of 12 firsts in the Berkshire class with his 700-lb. boar, Robinhood Laurel 10th, also capturing the grand championship. Out of the State exhibitors were: N. H. Locke Co., Jerseys; J. E. Thorp, Jerseys and Durocs; J. L. Gish, Berkshires.

FRUIT JOTTINGS.

Turlock district has a bumper crop of Thompson Seedless grapes, the rain doing very little damage to them.

This has been a good season for raisin grapes in the vicinity of Yuba City. A good quality of grape has been grown, and prices have been satisfactory.

The Farmers' Short Courses start at the University Farm, Davis, Oct. 2, and continue until Nov. 24. Special work is offered in general farming, horticulture, poultry, and dairying. A special course in tractors is added this year.

Lemon shipments out of California to Eastern markets have been especially heavy this year, and will probably continue so as a recent report from Palermo, Italy, states that an unprecedented heat wave struck the growing crop the 1st of July, destroying close to one-half the summer crop remaining on the trees.

State Market Director Weinstock, in an address to Lindsay and Porterville olive growers the other day, said: "The olive industry today is almost on the ragged edge, despite the fact that the industry has an absolute monopoly. Nowhere in the United States can olives be grown but in this state. It is a product that people want, if they only knew about it."

There is difficulty in securing supplies of cyanide of sodium for fumigation in the citrus groves. Prior to the war the entire output was produced by a German concern with a branch in this country. The American plant was shut down, the personnel and machinery going to the Fatherland when the conflict opened. Two American plants were established as soon as the field was cleared, and these promise that there will be no serious shortage when the labor market eases up.

A new fruit merger has been concluded by F. B. Anderson of the Bank of California, San Francisco. It combines the Alaska Packers' Association, the J. K. Armsby Company, the Central California Canneries and Griffin and Skelly. The company is to be known as the California Packing Corporation, and is to be capitalized by an authorized issue of \$10,000,000 of 7 per cent

cumulative, preferred stock, callable at 115, and 500,000 shares of common stock of no par value.

From 6,000 to 10,000 acres of otherwise rich soil on the Hawaiian Islands are so heavily impregnated with manganese dioxide, which renders insoluble the abundant iron in the soil, as to be almost worthless for pineapple growing. The fruit forms, but does not develop. Experiments have shown that wetting the leaves of the plants with a solution of copperas (sulphate of iron) caused the yellow, droopy pine to promptly take on new life. It turned green, and matured well-developed, well-flavored fruit.

Chief Deputy G. P. Weldon of the State Horticultural Commission announces that the embargo on California and Arizona citrus fruit shipments to Australia has been raised. The original quarantine, placed last February, affected every State in

the Union. The exemption now of California and Arizona means much to the citrus growers of our own State, as we were building up a nice little trade in this line with the Antipodes. Canker worm, from which California citrus fruits are free, is still troublesome in Florida.

The Federal seed importation act (which prohibits the importation into the U. S. of certain seeds when they are adulterated, or contain 3 per cent or more of weed seeds, or when clover or alfalfa seed contains approximately more than 90 seeds of dodder per pound) was amended August 11, 1916, by including the seed of rye grass and vetch and by prohibiting the importation of seeds which contain less than 65 per cent of pure live seeds, except that the seed of Kentucky blue grass and of Canada blue grass may be imported when it contains 50 per cent or more of live pure seed.

A Beautiful Home Makes Life Happier

This house looks pretty barren

This is the same place with a few trees and shrubs

THE farm home may be just as attractive as a city home. It is surprising what a difference it makes to have a few trees and shrubs, climbing and trailing vines, and a few roses about the place. It makes life more pleasant, increases the value of property, cools the air in summer, radiates heat in the winter, improves sanitary conditions.

Now is the time for you to think about planting—to get your mind made up as to the varieties you will set out the coming season. And, of equal importance with the selection of varieties is the selection of your nurseryman. "George C. Roeding" and "Fancher Creek Nurseries" are names synonymous with quality. If you order trees, vines, shrubs or plants from us you may be absolutely sure of their being TRUE TO NAME, strong and healthy—and that they will be carefully packed so as to reach you in A-No. 1 condition.

Citrus and Deciduous Fruits

—Apples, Almonds, Apricots, Pears, Plums, Prunes, Peaches, Nectarines, Cherries, Walnuts, Pecans, Olives, Oranges, Lemons, Pomelos, Etc.

TREES

Evergreens, Palms and Roses

—Climbing and Trailing Vines, Border Plants, Ferns, Street Trees, Evergreen Shrubs, Hedges, Etc.

Consult with Roeding--FREE

We are always glad to consult with prospective planters without any obligation on their part. Tell us the nature of your land and what you have in mind to plant and we will gladly advise you as to varieties and the prospect. Our many years of experience and a close intimate touch with California conditions enables us to advise our customers intelligently. Write us.

Growing Salinas Burbanks.

[Written for Pacific Rural Press.]

Salinas Burbanks are the potato best known and most eagerly sought after by the wholesale and retail trade in the northern markets of California, chiefly because their qualities, in keeping, appearance and eating, are well established in the consumer's mind, as being first class.

It is no trade secret that only a small percentage of the potatoes marketed as Salinas Burbanks have actually been grown there, neither are they entitled to the name because the seed from which they are grown originated in the Salinas district of Monterey county. It is simply one of those peculiar circumstances where substitution is practiced that no law seems able to overcome.

How this reputation has been sustained in spite of trade name manipulation and how growers of Salinas Burbanks now stand a good chance of cashing in for real money on their reputation, through the channel of certified seed growing, is told us by one of the largest and most successful growers in the Salinas district. At his request, we shall know him as Salinas in this article, though that is not of course his real name.

Trade Marked.—The experience of our Mr. Salinas as a spud raiser dates back a good many years, but as a seller of trade-marked goods, about 14 years. In this he has been conspicuous for during those years all of his potatoes have been sold under labels, "firsts" being designated as the Blue String brand and "seconds" as the Red String brand. The names of the brands originated with the idea of tying sacks containing the best spuds with a blue string and the next best with red string. This brand has been so well established in the city of San Francisco, that the most select trade eagerly picks up the supply at a premium over everything else in the spud market.

While the consumer knows but two brands on this ranch there are three, the third one being the culls and small potatoes which are known as "cow feed," their use being what the name implies.

Soil a Factor.—Grading, while an important factor, gives way to soil conditions and cultural practices when the success of this man is analyzed, for in his own words, "the sandy loam soil of the Salinas valley lowlands produce a tuber with a golden yellow color, peculiar to itself. Also, no matter what the nature of the seed, the potato grown here has a tendency to become perfect in size, shape and appearance."

All of the soil does not have these peculiar adaptations, for on the ranch in question only 100 acres is considered perfect potato land. And on account of diseases and pests this is only planted to potatoes once in two years. Immunization from potato moth and other pests which live on either the tuber or the vine, is accomplished by planting grain every other year and sometimes two years in succession when the ground is particularly badly infected.

Soil Preparation.—Preparation for the year's crop is commenced in mid-winter by a shallow plowing of

the soil and then followed by a deeper plowing, for moisture conservation is essential where irrigation is not practiced.

Planting is customary the last of April, or through May, in rows 38 inches apart and hills about 17 inches in the row. Northern-grown seed has had the preference in the past, smaller tubers being liked for this purpose because vine growth starts sooner than when larger seed is used and quick growth is a desirable quality as the matured potato in such cases is a better keeper.

Certified Inspection.—Because certified seed is being grown this year on the entire 100 acres, under State supervision, three inspections have been necessary by State officials, but in the past cultivation was the only requirement from time of planting till digging time, which varies from September 15 to November. In case the tuber moth is bothering the entire crop is dug as hurriedly as possible and sold immediately. At other times, especially if the weather is cool, the crop is sometimes stored and cured in piles.

Especially has this been the case with seed for the succeeding year's acreage, but the practice is considered inadvisable as they lose their fertility and do not start growth so quickly when planted.

This year's planting was with selected seed from Oregon, the hope being that acclimatization and improvement may be accomplished with it in the Salinas Valley, thus capitalizing the name "Salinas Burbanks" for propagation as well as commercial reasons.

BUR CLOVER AND MELILOTUS.

[Written for Pacific Rural Press.]

J. A. Harliss of Santa Clara county will mix bur clover with melilotus seed for his 5-acre prune and apricot orchard. Last fall before the rains, he broadcasted, without irrigation, one-half acre of melilotus alone as an experiment, and also some in the back of the orchard where bur clover volunteers. The half-acre came up a beautiful stand, but when it had scarce gotten its third leaf, an unusually severe frost melted it entirely.

That back in the orchard grew up with weeds and bur clover until it was waist high.

"My neighbor, who irrigated earlier in the fall and sowed seed as soon as he could cultivate the soil, had a fair crop of melilotus mixed with a good amount of bur clover," says Mr. Harliss.

About Oct. 1, 1914, Mr. Harliss had inoculated purple vetch seed in water which was run through soil obtained from a field where vetch had grown well before. After drying the seed, he mixed 25 pounds of this with 15 pounds of rye for each acre. The trees were about 20 years old and 18 feet apart. The orchard was checked for irrigation; but in spring, the checks interfered so seriously with plowing that this will not be done again. When it came up, he thought there wouldn't be much crop, but it was waist high when he

Save those dollars

Reduce the cost of clearing land. If you have been using ordinary dynamites for blasting stumps, try either of the Giant Farm Powders—Eureka Stumping if the soil is dry or Giant Stumping if it is wet. These improved explosives go further and get the stumps out cleaner. They will save you dollars on every acre, because they are made especially to meet Western conditions.

Blast Stumps With

GIANT FARM POWDERS

STUMPING—AGRICULTURAL

"They save work and money and give results when all other means of removing stumps have failed," writes Robert Chabot, Moclips, Wash.

"Better than any other," says A. E. Adkins, Woodburn, Ore.

"Most satisfactory," says John Zurr, Santa Rosa, Cal.

It was the product of this company that originated the common name "giant powder." Other explosives are sometimes represented to be Giant Powders. If you want to save dollars on your stump blasting, insist upon having the genuine.

"Better Stump Removing" a Valuable Book—FREE

Get the Giant Book, "Better Stump Removing," and find out how you can cut the cost of clearing land. Our other books on Boulder Breaking, Ditch Blasting, Subsoil Blasting, and Tree Planting with Giant Farm Powders are also sent free on request. Mark in the coupon the books that you prefer.

pruned in January.

He couldn't get a man to plow when he wished and the rye grew above his head, with vetch still longer—great ropes of it. Mr. Harliss is 6 feet 1 inch tall; and pictures

he has of that crop show him and his wife submerged in it. Some that was left grew 8 feet tall into the trees. Purple vetch may again become available, but none can be had this year.

Transferring Bees.

To the Editor: How do you transfer bees from a box hive to a movable frame hive?—E. W. C., Paterson.

[Answered by J. C. Epperson of the A. I. Root Co., San Francisco.]

We will assume that your hive or hives, having been received in the flat, are put together and painted, and contain frames of wired foundation ready for the bees. Light your smoker and put on your bee-veil. Move the old hive back four or five feet, and put the new hive in its place. Prepare a small covered hiving box about 8 inches deep with no bottom, that will just cover (not slip over) the bottom of the box hive. Turn the box hive upside down; set the hiving-box over it, and then drum of the sides of the hive with a couple of sticks until about two-thirds of the bees pass up into the hiving box. Gently lift off the box containing the bees, and dump it in front of the entrance of the new hive. Make sure that the queen is among them, by watching for her as she passes with the rest into the entrance. If you do not discover her, look inside the hive. If you still fail to find her, drum out the bees from the old hive again until you do get her, for, to make the plan a success, she must be in the new hive.

Return to the box hive, turn it right side up and set it down a couple of feet back of the new one, with its entrance turned at right

angles. It still retains about one-third of the original colony, the combs, and all the brood. Allow the old hive to stand at least 21 days, at the end of which time the brood will be hatched except a little drone brood which will be of no value. Turn the hive upside down, and drum the bees out again into the hiving-box. Next put an entrance guard of perforated zinc over the entrance of the new hive. Smoke the bees of the hive and then those in the hiving-box, after which dump it in front of the entrance of the new hive, as before. The smoking is to prevent fighting on the part of the bees at the second drive, and the entrance-guard is to catch the queen or queens that have been raised in the meantime in the old hive. These, one or two, if virgins, should be caught on the perforated metal and given to some queenless stocks. If the old queen in the new hive is a valuable one she should be caged at the time of making the second drive. If neither queen (the one in the old hive or the one in the new one) is valuable, the perforated zinc need not be used.

ALFALFA FOR SEED.

To the Editor: In a recent issue of the Pacific Rural Press I read of J. M. Bomberger plowing out a part of his alfalfa for the purpose of raising seed. I thought it might be of

interest to you to know that some of the farmers of Stanislaus county have been raising seed for a number of years.

The last four falls I have hulled for 30 to 35 growers each fall and some of them get very good returns. Thin alfalfa with short, woody stock generally gives the best yields. Thick fine stems do not seed because the sun cannot reach the blossoms only on the tips of the stems.

The third cutting is generally left for seed, and should not be irrigated, as that causes too heavy a growth of hay. Damp or sub-irrigated land generally does not seed for the same reason.

I have looked over Mr. Bomberger's field and think his plan a good one. But his ground is producing too heavy a growth. He seems to have too much moisture.

Inspected Seed.—Some of the farmers have their seed inspected before cutting, by the County Horticultural Commissioner. If he finds their fields clean from all noxious weeds he tags the sacks "Inspected Seed." That insures the buyer from getting dodder, bad grasses, etc. Local seed has cut the price to the user by cutting the middle man's profits, and may account for some

of the dealers knocking home-grown seed. But much of the seed is A1 and the business is growing. Hulling season commences the last of September.

O. E. Lambert.

Modesto.

KILLING SNAILS AND SLUGS.

[Written for Pacific Rural Press.]

Lime often has no effect on snails. This is because it is not put on them. It is sprinkled on the ground in daytime.

The snails work at night. Geo. N. Tyler of Santa Clara county usually recommends a couple of ducks around the yard. A friend of his says to sprinkle hydrated lime on the snails about 9 p. m. when they are all out and busy. Mr. Tyler says the lime will not hurt the tenderest plants directly; though it might do too much injury to stems by setting free too much ammonia from nitrogenous fertilizers, if applied too much to soil so fertilized and confined in a house.

On board the S. S. Congress which was burned two miles off Coos Bay bar, Marshfield, Ore., was a Bates Steel Mule, being shipped to the interior of Washington. This was one of four Steel Mules shipped to the northern State during that week.

Pull big stumps by hand

Clear your stump land cheaply. No expense for teams or powder. One man with a

K HAND POWER Stump Puller

can outpull 16 horses. Works by leverage—same principle as a jack. 100 lbs. pull on the lever gives a 48-ton pull on the stump. Made of Krupp steel—guaranteed against breakage. Endorsed by U. S. Government experts.

The machine that keeps a-going

Never mind the weather, soil, road or time of day or night

When you go out to work with a tractor, you want one that keeps going—that is built on a keep-going principle, of the kinds of materials and by the mechanical skill that enable it to perform, regardless of conditions.

The application of the ball bearing to the endless tread of the Yuba is largely responsible for its utter independence of weather and soil conditions. It permits the use of the widest tread extensions when work in wet adobe or tule land demands. No other tractor has the "Ball Tread." It is an important step in tractor development you should know about. The Yuba catalogue is a reference book every farmer should have.

FIELD CROPS.

Lima bean threshing is in full blast in Ventura county.

Growers of beans are expecting to receive more than \$7,500,000 for a crop estimated at 1,800,000 eighty-pound bags.

Twelve square miles of beets have been contracted for by the Pingree Sugar Company at Corcoran for the coming season.

Indications are that Yolo county will have an average output of 420,000 sacks of rice. This is an average of thirty sacks to the acre.

The chile pepper crop of the present season at Garden Grove will sell for about \$300,000 is the estimate of one of the largest growers of this section.

Two hundred acres of Hollister land has been sold by Palmer Hewitt to the C. C. Morse Seed Co. for \$250 an acre or \$50,000 for the 200-acre tract.

E. E. Dunning's lima beans in Ventura county, irrigated against his orders in June, will have to be cut green about the second week in October. He lives on the level, open to ocean fogs.

Rice men of Yolo county have decided to combine with the Pacific Rice Growers' Association for the marketing of their crops instead of selling independently of the bigger organization, as recently proposed.

California produces what is technically called crystallized rice, according to J. H. Stephens, the new president of the Pacific Rice Growers' Association. This is superior to that grown in most Southern States.

The 1916 contracts for rice grown in the Sacramento valley were completed this week. The Pacific Rice Growers' Association stated a large field force will interview the rice growers and close contracts for their crops.

The entire output of beet pulp from the San Joaquin Valley Sugar company factory in Visalia was sold to the Western Meat company of San Francisco which will feed it to cattle purchased and fed near the sugar factory.

The warden of San Quentin penitentiary sends information to local rice growers that he will accept orders for the standard size grain bag at the price of 10 cents each, and that orders can be filled and shipments made immediately.

The crop report of the United States Department of Agriculture says that California is second in onion production. The estimated yield for 1916 is 1,914,000 bushels, second only to New York with a yield of over 2,000,000 bushels.

E. C. Hittue, special beet sugar investigator for the United States Department of Agriculture, has arrived in Imperial Valley to outline a series of tests to determine the proper time of planting and to try sugar beets on different types of soil.

Twenty-seven thousand bags is a conservative estimate of the amount of mustard grain shipped from Lompoc this season. As much as nine cents a pound has been paid by San Francisco buyers, though 7½ cents is considered a fair average for the crop.

The California Lima Bean Growers' Association met Sept. 5, and issued a new scale of prices, to take effect immediately: \$5.30 for November-December shipment; \$5.37½ for prompt shipment and \$5.42½ for immediate shipment. The average price last year for the grower was \$4.32.

Rice growers in the Sacramento valley say that the blackbird pest costs them on the average of \$10 an acre a year to protect their fields. They favor removing all legal pro-

tection from the birds. This would permit their sale in the market, and experience with all game has been that whenever it is open to the market-hunter it is soon exterminated.

Hop prices are soaring skywards. Sacramento hops are selling at 13c per pound, against 8 and 9 cents a week ago. Santa Rosa hops have jumped to 16 cents, while New York State hops have gone to 43 cents per pound because of the close proximity of the market and the extra quality of the crop. The California hop crop this year will be very large, something like 114,000 bales.

Word from Hanford says that hunters and ranchers are divided as to whether the ducks are actually damaging the rice crops. Some ranchers state that ducks help rather than hurt the rice growers. It is pointed out that the ducks do not touch rice unless it has been knocked down, and the ducks themselves do not knock the rice down. As the knocked-down rice would result in a volunteer crop the following year, which is what the grower does not want, the ducks should be a help in the matter.

Geo. Barrett of Yerrington, Nev., has a new potato propagated from the crossing of Netter Gem and Early Rose varieties. It is now in its fifth year of cultivation, and each year is making it a finer species. It is a pretty specimen, being very clear with very little display of eyes and about three inches long. The main points claimed for it are that it is a good eater, fine keeper, and is early to mature. The latter is a strong point as frosts often get the later potatoes in Nevada. Mr. Barrett claims to be getting from 12 to 14 bushels to the acre.

DECIDUOUS.

Bartlett pears are being harvested in Lake county, and 1000 tons are being dried.

A. Peterson, a rancher and orchardist of Tulare, says the crop of French prunes in Tulare county is the heaviest and best in years.

Frank N. Meyer, agricultural expert for the U. S. Government, will go to southern China to seek a pear immune to the blight, which is destroying orchards in many parts of the United States.

The prune crop of France is almost a failure, according to cable advices received in San Francisco recently. The French crop is normally from 25,000 to 30,000 tons. This year it is placed at about 1,100 tons.

The Pomona Valley Canning Company is just winding up a summer run on deciduous fruits which amounts to 1,400,000 quarts of peaches and 350,000 quarts of apricots or 1,750,000 quarts total, says an exchange.

Exceptional cases of prune trees blossoming in September are found in several instances around Chico. The blooming is attributed by a local fruit grower to the fact that they had been attacked early in the season by the red spider. The grower said that the late blooming would probably affect next year's crop.

CITRUS, NUTS, SEMI-TROPICAL.

The California Mutual Packing company is to locate in the Riverside district, and erect a packing house.

There is a movement on foot to build a citrus packing house at Richgrove this season, to handle the winter crop.

Orange packing will be under way in the Oroville district by November 1st, says F. W. Mason of the Stewart Fruit Company.

Secretary Doolen, of the Santa Barbara Walnut Growers' association, recently sent \$18,000 worth of

FIVE STANDARD

SUB-SOIL PLOW

KILLEFER
QUALITY

KILLEFER
EFFICIENCY

This is one of the line of Deep Tillage Tools shown at the Tractor Demonstration at Puente, Cal.

Every report which we have been able to obtain of subsoil work done during this past fall, has shown extra large gains in crop returns. Our offer of last year still holds good—to give a subsoil plow to any rancher having 500 or more acres for one-half of the increase in crops, for one season only. If we have nerve enough to risk \$300.00 to \$600.00 on this work, what is there in it for you?

THINK IT OVER

The Killefer Manufacturing Co.

2209-21 Santa Fe Avenue,

Los Angeles, Cal.

Get ready now for your winter spraying. Don't wait till the last minute or something may turn up to cause you delay—and you can't afford to run any risk on this important matter. Send now for our big new complete catalog of

Bean Power Sprayers

Hand Pumps, Barrel Pumps, Spray Accessories, etc., and select the equipment you will need. NOW—is the time to do it.

The coming season ought to be a rich season for the fruit growers of this State—and the money will go to the growers who clean up their trees and work for a good crop of first-class fruit.

Whether you have just a few acres—or hundreds—there's a Bean that will just meet your requirements. When you buy a sprayer it will pay you to buy the best—cheaply built rigs are ineffective, waste time and money, and are always unsatisfactory.

Send right now for the catalog—and get ready for your share of the big profits ahead.

Balboa Bldg., San Francisco.

checks to 175 growers as their
share of the final settlement for last
year's crop.

The California Ripe Olive Co.,
which has heretofore maintained its
offices in San Francisco, will move
to Oroville by Oct. 1.

Louis Arcand, a young farmer of
the Arbuckle section, believes he
has originated a new variety of al-
mond. The new nut resembles the
the Ne Plus Ultra, but has a larger
and heavier kernel, and is not
double-kerneled.

It is surmised that walnut meats
this year will command about 16
cents per pound, more or less. The
French embargo on shelled nuts
makes an actual famine on walnut
meats, as France supplied over four-
teen million pounds last season,
and California only about one mil-
lion pounds.

Most of the crop of the Durham
Almond Growers' association sold at
a net price to the association of
18½ cents for the Nonpareils.
The Peerless variety sold for 15½
cents net. The IXL went at 16½,
the Ne Plus at 15½, the Drakes at
14½, and Texas at 14. The crop
was approximately a hundred tons.

George Boelman of Gridley Colony
No. 5, has several trees seven or
eight years of age on which the nuts
are so thick that they weigh down
the limbs and the trees have to be
propped with poles. Many peach
orchards in that section planted ten
years ago, with a walnut tree at
every third place in every third row,
are now practically walnut or-
chards.

GRAPES.

The raisin crop in the vicinity of
Marysville is below that of last year.

H. W. Wilson of Kerman got 72
trays of Thompson grapes from 69
three-year vines.

B. H. Fisher of Kerman picked
117 pounds Thompsons from one
vine four years old.

Sixty-two carloads of Tokays left
Lodi Sept. 14 for the Eastern mar-
ket, making it the banner shipment
of the season.

Raisin shipments from California
for August amounted to 14,186 tons,
according to the California Asso-
ciated Raisin Company.

"After the frost, I could have sold
this corner of Thompson vines for a
song last spring, but now it is going
½ tray per vine," says C. K. Hays
of Kerman.

California grapes will find strong
competition in foreign grapes dur-
ing the coming week when the first
shipment of Almeria grapes, consist-
ing of 9800 kegs, is due to arrive
in New York.

More than \$40,000 gross was
realized by the Japanese tenants
on the Palm ranch, near Wasco,
from the sale of the Seedless and
Tokay table grapes and the raisin
crop this year.

The recent rainstorm did some
small damage to the drying raisin
crop in the vicinity of Fresno and
to the table grape crop about Stock-
ton—notwithstanding which the
rain was welcome on all hands.

A refund of \$200,000 to the
wineries of the Fresno district will
be made by the government, follow-
ing the passage of the new emer-
gency revenue bill by Congress, ac-
cording to the Fresno internal reve-
nue office.

Tokay shipments from California
to the East this season have all met
with excellent sales. First-crop
fruit is being fast cleaned up, and
the second crop is maturing rapidly
and promises to be superior to
average second-crop fruit.

MISCELLANEOUS.

Lima bean spraying for aphids may
become general among the growers
of Santa Barbara Co. to insure
heavier and earlier yields, accord-
ing to C. W. Beers, County Horticul-
tural Commissioner. Sixty acres of
beans thus sprayed experimentally
demonstrated that the practice is
highly remunerative.

The Delano Farm Center has

taken steps toward the organization
of a farm loan association to benefit
from the farm loan bill.

The farm advisory movement was
started in the West four years ago,
the first farm bureau with a farm
adviser having been established in
California. Since that time fifteen
counties have organized farm bu-
reaus and engaged farm advisers.

The British "tanks," the armored
motor cars used in recent assaults
on German trenches in northern
France so successfully as to attract
world-wide attention, were built for
the most part, it is said, in Peoria,
Ill. They are simply heavily ar-
mored Caterpillar tractors.

Representatives of Miller and Lux
are conferring in San Francisco
with a committee of farmers of the
Madera county plains over the pro-
ject to irrigate more than 400,000
acres of land by a system of storage
dams supplied by the San Joaquin
river. To accomplish all this, many
millions of dollars will be needed

Laws Regarding Agricultural Fences.

[Written for Pacific Rural Press.]

Our laws regarding fences have changed greatly since 1850, when the first California Legislature drew up general laws. A landowner in early days paid little attention to fences, since he was not obliged by law, customs, or conditions to so divide his cattle range, etc., against that of his neighbor. But soon agriculture was taken up in earnest, though the gold fever was still abroad, and by laws passed by the legislature of 1855-60 and later, the division of properties by actual fences, instead of merely mounds at the corners, etc., was put on a more definite legal basis.

Strange to say, the fence laws are not identical in all counties of California, since the legislatures in older days often picked out particular counties to which only this or that law should apply. This method of law-making is not allowable now, but not all these older acts have been repealed. However, in general, and always bearing in mind that an attorney's advice should be sought in any such legal matters, we may state a few points concerning the agricultural fence as we have come across it in the Codes and court interpretations of the law of California.

(1) A legal agricultural fence is one of such substantial construction that it "will turn cattle of reasonably gentle disposition."

(2) To be strictly within the law, a fence should be at least 4 ft. high and 1 foot thick at the top; worm fences 5 feet high; and post, board or picket 4½ feet high. Those of wire must be equal in strength to those above.

(3) One who maliciously burns hay, grass, standing grain, fences, etc., of another is liable to a punishment of a 1 to 10 year penitentiary sentence.

(4) One who wilfully "leaves the gate open" or tears down or otherwise destroys the fence of another without permission, is guilty of a misdemeanor (fine not exceeding \$500, county jail sentence not exceeding 6 months, or both).

(5) No fence may be built over 10 feet in height with the intent of annoying the adjoining owner.

(6) By statute of 1915, railroad corporations in California must fence both sides of their track or be liable for any damage done to animals that may be struck by passing trains, etc., thereupon; crossings must also be maintained wherever reasonably necessary.

(7) A partition fence is usually built on the boundary line between two farms with the cost of erection borne jointly by the two property owners. One cannot compel the adjoining owner to pay his share, unless the fence is of material benefit to him. When, however, he does come to use the fence, that you have erected at your expense, to help enclose part of his property, he may be compelled to pay one-half of the construction cost of that length of the partition fence that is now of use to him. To remove a partition fence that is owned jointly, it is necessary to obtain the consent of the adjoining owner.

(8) If one encloses part of his neighbor's land and openly takes pos-

session and pays the taxes upon said part for 5 years, he may claim ownership of the land by "the law of adverse possession." But if the division fence enclose said portion of the neighbor's land unknown to the owner, such possession would not be "open."

(9) Barbed wire fences.—Since this type of fence has come into general favor, the law treats it as no more dangerous in itself than one of wood, etc. If, however, it is left in such condition that it is almost a trap, as when but one strand is left, and that near the ground, the owner is liable for any damages that other people's cattle, etc., may sustain. And it is often held that in case of barb-wire fences left in such condition, the owner is likewise liable if the fence be entirely upon his own land and the cattle trespassing thereon.

Though some states require a top rail of wood, a legal barb-wire fence in California is one with two or more strands of wire tightly stretched between posts and at such a height as to turn stock.

(10) Fruit trees growing upon the property line are owned in common; and the fruit thereon should be evenly divided. But if the trunk of a tree be upon one's land he is entitled to all the fruit on said tree, though many branches overhang the property of his neighbor. If obnoxious, the adjoining owner may cut off those branches that overhang his land.

SMALL WHITE BEAN.

[Written for Pacific Rural Press.]

One of the essentials in small-white bean growing is to have plenty of moisture in the ground before planting, even if you have to irrigate in November and December.

That at least has been the experience of M. F. Martin of Monterey county on a dark loamy soil. By practicing winter irrigation he finds one cultivation ample for the conserving of all moisture required under his conditions. For a number of years Mr. Martin has farmed his land to sugar beets and potatoes, but last year his son grew a quarter acre of small whites that yielded 22 sacks of marketable beans; so this year 24 acres were planted to the same crop. After irrigating, the land is plowed shallow, then cultivated down well with harrow and land roller, the object at all times being to get the soil in garden seed bed condition. If there is an abundance of weeds, cultivating is started soon after the plants are out of the ground, but is generally delayed till the vines are about four inches high. At harvesting time, cutting is done with a regular bean cutter, and the vines are put into shocks. If cut when fairly well matured, a week in the shock is sufficient but in some cases two weeks is required, after which they are ready to be threshed.

In normal years Mr. Martin expects a yield of 15 to 20 sacks to the acre, a sack weighing 90 pounds, which at the present price of beans means an especially profitable crop.

The total shipment of raisins from the Dinuba district will be close to 125 tons for the season.

DEEP WELL TURBINES

No valves to pack or plunger rods to get out of order. For use in any well ten inches in diameter or over.

A complete line of irrigating pumps of all descriptions, horizontal and vertical for belt drive or direct connection to electric motor.

Prices as low as are consistent with good quality and workmanship.

Bumper Grain Crops

Good Markets — High Prices

Prizes Awarded to Western Canada for Wheat, Oats, Barley, Alfalfa and Grasses

The winnings of Western Canada at the Soil Products Exposition at Denver were easily made. The list comprised Wheat, Oats, Barley and Grasses, the most important being the prizes for Wheat and Oats and sweep stake on Alfalfa.

No less important than the splendid quality of Western Canada's wheat and other grains, is the excellence of the cattle fed and fattened on the grasses of that country. A recent shipment of cattle to Chicago topped the market in that city for quality and price.

Western Canada produced in 1915 one-third as much wheat as all of the United States, or over 300,000,000 bushels.

Canada in proportion to population has a greater exportable surplus of wheat this year than any country in the world, and at present prices you can figure out the revenue for the producer.

In Western Canada you will find good markets, splendid schools, exceptional social conditions, perfect climate, and other great attractions. There is no war tax on land and no conscription.

Send for illustrated pamphlet and ask for reduced railway rates, information as to best locations, etc. Address

SEED SELECTION AND CORN GROWING.

[Written for Pacific Rural Press.]

Eighty bushels of corn to the acre is not by any means a record corn crop for the State, but it is a profitable yield when it can be continuously secured in addition to a good crop of grain hay each year.

At least so thinks W. D. Trehwitt of Kings county whose yield averages that after taking off a crop of wheat or barley hay from the same land each year. Corn on this ranch is usually planted the latter part of June after the land has been irrigated and plowed good and deep. As soon as it gets above the ground cultivating is done as long as possible, usually three times. One irrigation is made after planting, when the corn is just beginning to tassle out.

Seed selection is given a great deal of credit for the continued high average yields by Mr. Trehwitt, two selections being made each year. While the corn is still in the field it is gone over the first time, stalks being stuck in the ground near those stalks which are medium in size and which carry a medium amount of long, straight row ears. At harvesting time the ears from these stalks are husked separately and taken to the barn where they are later picked over again. Here the ears are compared again, the above qualities as well as the tightness of the grain on the ear being considered. The ears scoring the highest in this final selection are the ones used for the next year's seeding, the butt ends, however, never being used for seed.

GRAIN SORGHUMS FOR PASTURE AND SILAGE.

To the Editor: Are grain sorghums safe to pasture stock on before they head? That is, are there any poisons or any danger of bloat? Is Egyptian corn more valuable for silage than broom corn? What is the comparative value of each if siloed after they have dried, and after the grain is off, as compared with alfalfa hay?"

Answered by Prof. F. W. Woll, University Farm, Davis, Cal.

Grain sorghums may be safely pastured before the plants head out, provided the crop has not been stunted in its growth by frost or extreme drouth.

There is no material difference in the composition or value of Egyptian corn and broom corn for silage. The stalks alone placed in the silo after the grain has been harvested will not be likely to make the best kind of silage. A great deal of water must be added in order to have the siloed mass sufficiently moist to insure correct fermentations of the cut stalks in the silo. One can hardly give a definite figure for the comparative value of such silage and alfalfa hay, as there is no experimental evidence on this point. It would probably take five or six tons of silage from sorghum stalks to equal a ton of alfalfa hay in feeding value.

Farmers throughout the West are said to be opposed to the proposal to grant the railroad trainmen of the country an eight-hour day and then let the railroads even up by raising freight rates, declares Henry N. Pope, President of the Association of State Presidents of the Farmers' Union. He says: "Today we find the highest paid laborers in the world, making three times more money than farmers, demand-

This 15 H. P. G-E Motor pumps water for the irrigation of 40 acres of Alfalfa on a large western ranch.

Why not investigate the possibilities of "electric" irrigation for your land?

Once installed, you merely throw the motor switch—a few cents' worth of electricity per hour will do the rest.

Just call up your lighting company or one of the General Electric Company's Offices, and ask a representative to look over your proposition.

Don't wait until your crop is lost for need of irrigation. Get all the information NOW.

Puente Tractor Demonstration.

The Best Tractor Meet ever Pulled off in California Enabled Thousands of Farmers to Decide Their Tractor Questions.

[Written for Pacific Rural Press.]

"Mules," "Bulls," a "Happy Farmer," "Water (loo) Boys," "Little Fellow with a Big Pull"—all that sounds like agricultural strength and happiness. "Ball Tread" and "Chain Tread" are just as agricultural, while "Caterpillar" and "Best" are still stronger. Little ponies of the tractor family made as much noise, in due proportion, as any of them, and were as limber in the joints. Several crosses between trucks, autos, and tractors tried to fill the dual purpose field; and much agricultural machinery was shown. They were all there in multiplied numbers at the Puente Tractor Demonstration Sept. 19-23.

They most all plowed well in the general demonstrations daily; and in private demonstrations did as they liked. The Yubas chased their tails around a little pile of dirt and then let a pack of Deeres chase them around the fields. The Big Bulls just walked around a 40-foot circle without any driver, patiently pulling double disks repeatedly over the softened ground. The Waterloo Boy hauled Killefer and Forkner harrows in circle half knee-deep in dust, without any driver, and then went onto the big field as brave as any. Everybody recognized the "Mule," which did a lot of braying by means of a whistle on the exhaust. But this machine demonstrated a capacity for doing things other than making a big noise. In pulling a heavy double disk at extreme angles it powdered the dirt so fine you could push your fingers through it with ease to the extreme depth. The whole Samson family was out, but you would have to be introduced, for you wouldn't expect Samsonian strength from such little fellows till you see them on their dynamometer or disking in soft ground. You also had to be introduced to the Sandusky "Little Fellow with the Big Pull," for you had to see him to know he was around even when working, and then his spiked wheels made you think of juggernaut rather than a harmless "little fellow." His principal object was to show what a tractor should do, not what it could do in emergency, though he claims 33 per cent reserve power. The light-weight Happy Farmer was all right till the third public demonstration, when he got a case of acute colic, as all of us are likely to do. The baby of the bunch, unsophisticated but earnest, is the latest born into the family of Lambert, and its worst trouble seemed to be that the disk it was pulling would get clogged on

clods that had to be dug out with a crowbar. The Babies of the Best family begged to be excused because they played too long on their way to Puente; but when they did get into the harness in front of their plows, they turned square corners like soldiers. There was a bunch of Caterpillars too, the big one swung around the ends in the plowing demonstration with a majesty that compelled awe; and without stopping, puffed away deliberately as if there were no intention of ever stopping. And this Caterpillar, as well as its Best mate, burrowed some 18 inches underground with a Killefer subsoiler, loosening a strip of dirt eight feet wide to air, which it has not had for a few thousand years, and to water which has usually puddled the surface before it would store itself in the underground for future use of farm crops. The Barker four-wheel drive truck-tractor was just a-borning and not able to be out. The Los Angeles Auto Tractor Co.'s tractor attachment for Ford cars to plow, with the motor running at 12 to 15 miles an hour on high caused much comment. They didn't plow in the public demonstration. The La Dow combination road and farm tractor did some plowing with what was estimated at 16 h. p. at a four-mile speed.

The Best Ever.—Never in California has there been so good an opportunity to select one tractor out of many, on the merits of their work all at once under the same conditions; and never have there been so many who seized the opportunity to investigate. Time after time, we asked farmers if they were tractor users; and most of them responded either that they were at the demonstration to pick out the one most suitable for their conditions, or that they were there to decide whether any tractor would do the work on their places.

Our enthusiasm burned high, but we could not let that color our estimates of attendance, which are, therefore, lower than others. At the afternoon concerted plowing demonstrations where fifteen machines were allotted space in proportion to their advertised drawbar pull, most of the spectators congregated; and careful estimates at these times placed the attendance at an average of about 1,000 per day. This, of course, does not count those who came and went before and after the general demonstrations. A considerable number came from Imperial Valley and north of Tehachapi.

Who Did It.—The demonstration was carried out by the Los Angeles Traction and Implement Dealers' Ass'n. Arrangements were in hands of committees. The field committee gave general control to C. W. Mar-

tin, a man of good lungs, tremendous energy, and a determination that there should be fair play. He emphasized the fact that it was no contest to see which tractor would plow its land first, but that all machines

involved were there to give farmers (not city folks) a chance to decide whether to use tractors on their own farms, and what kind to use.

A minimum depth of six inches was required on this grain land which had never been plowed over three or four inches deep, and was good adobe soil, not having been irrigated.

A complete set of rules was drawn up and each member of the Association put up \$25 to insure compliance with them. Every tractor entered in the general demonstration had to start plowing at one o'clock sharp.

They were not to be allowed to run faster than their catalog speed, though in several cases this ruling seemed to be ignored. A chart prepared before the demonstration started, showed the location of each field; and positions of tractors were chosen by lot. Three fields were laid out for the one o'clock general demonstration on grain land, and staked for each machine. Separate fields on bean land were laid out for each exhibitor on which private demonstrations were carried out before and after the concerted plowing events each day, as suggested by spectators. These included two big grain fields for the biggest Holt and Best tractors to work over. The private demonstrations included various kinds of plowing, tillage, land leveling, subsoiling, and stunts. They gave opportunity for every question the people wanted to ask.

General Demonstrations.—It was real exciting to stand behind the panting, puffing, iron horses, so eager to jump into what was forbidden to be called a race. At the drop of a flag they charged with unearthly explosions and showed off their different qualities, pulling various kinds and makes of plows.

Some with throttles wide and at top speed, made the first turn and back before slower machines got across. In this as in life, however, not always "to the swift is the race."

The question most asked was, "Can the machine turn easy and quick enough to cultivate orchards?" Here in the general demonstration was an unexcelled opportunity to see the turning capabilities of the machines. There was a great difference in ease of handling, in shortness of turns, and in ability to hit the furrow after the turn. Some drivers had scarce felt a machine before, though spectators expect most skillful handling and judge machines accordingly. Many people noticed the varying depths different machines plowed; also whether the motors seemed to labor unduly. The biggest machines having too few plows, generally plowed deepest and finished latest.

Exhibits.—Auto trucks were most numerous, the Chicago Pneumatic Tool Co. having five Little Giants with worm and chain drives and capacities of 1 to 2 tons at speeds up to 25 miles an hour and 40 in a pinch. One was loaded with an engine and air compressor weighing 5,600 pounds. Of the several Knox Six-wheel trucks, one paraded with a 10-ton load of cement piping. Stewarts, Republics, Gram-Bernsteins, and Menominees made a bigger truck show than at the State Fair. Ensign and Master carbureters were there for investigation. Kellar-Thomason and Irrigators' Supply Co. supplies, Schmeiser land levelers, and roller bearing wagons were shown. The Holts had their own land leveler and disk plows. The John Deere Co., the Oliver Plow Co., the California Implement Co., the E. P. Bosbyshell Co., and Dixon & Griswold furnished plows, disks, harrows, etc., for use and for exhibit. Hughson & Merton furnished power-lift disk Case plows with their tractors. "The Killefer Mfg. Co. doesn't make anything that pulls easy." Whenever a tool is needed that will stand more pull than a tractor can give it, they make

it. And their tools were used in the private demonstrations. A three-standard subsoiler loosened dirt 18 inches deep and 8 feet wide at a trip. A four-mold-board Killefer plow turned 64 inches as much as 13 inches deep in places. A chiseler such as takes the place of plows in many bean fields tore up dirt a foot deep and eight wide with nine standards. Their double deck plow with subsoiler underneath would have drawn still bigger crowds, but they were all sold out.

Northern Demonstration.—Before the grand parade Saturday of all tractors, beginning with the biggest, everyone plowing into the furrow

left by the one in front, across the headlands left in the three previous general demonstrations, plans were actively on foot to hold at least one annual tractor demonstration in northern California and one in Southern California, eliminating all objectionable contest features and always making them of true competitive value to prospective power farmers.

It is rumored that a syndicate of San Francisco bond houses is prepared to underwrite an issue of \$2,000,000 6 per cent bonds, secured by a first mortgage on 21,000 acres, comprising the old Fair ranch at Knight's Landing.

BLIND MILTON DICTATING TO HIS DAUGHTER
From the original by Munkacsy, in New York Public Library

The Vision of the Blind

"Thousands at his bidding speed,
And post o'er land and ocean without rest;
They also serve who only stand and wait."

Was the spirit of prophecy upon John Milton when, more than two hundred and fifty years ago, he dictated those words to his daughter?

Did the "blind poet" have a vision of the millions of telephone messages speeding instantly over hundreds and thousands of miles of wire spanning the continent?

"They also serve who only stand and wait." The Bell Telephone is your servant even while it "only stands and waits." The whole system is always prepared and ready for your instant command.

Every wire and switchboard and telephone instrument is kept alive and responsive by an army of telephone workers.

Each one has his special part to do and, because he does it faithfully, countless messages speed throughout the length and breadth of the land, at every minute of the day and night.

What Fruits Shall California Grow?

(Continued from First Page.)

But this was still, primarily, an exhortation to have fruit locally grown in some form which would make sales throughout the year and displace importations. The chance of exports was of course but dimly discerned and the prophecy not speedily realized—for that is the usual way with prophecies. In fact a decade intervened before T. F. Cronise wrote this:

Until within a few years California has been entirely dependent on the Eastern States and Europe for preserved fruits and vegetables, pickles, etc., and has annually consumed about a million dollars' worth. The State is now, however, on a self-supplying basis and is shipping to Nevada, British Columbia, Mexico, and to China and Japan. The total annual production of these articles amounts to \$650,000.

Dried fruits are now being largely prepared and their appearance is very fine. The canning of fruits is also assuming large proportions and will soon become an important industry.

A Decade of Preparedness.—The second decade of American occupation was, in fact, the decade of preparedness as the first was of prophecy—though the latter had not yet reached its limits. It was in the '60s that a number of things came through—in addition to those already suggested. In 1866 250,000 oranges reached San Francisco from Los Angeles, while 3,000,000 oranges came from Hawaiian and Society Islands, Lower California, Mexico, Central America and Panama. In those days they counted the fruits, not the boxes or carloads as we do now. But the rolling up of a quarter of a million oranges in a year gave the growers great boldness, for it was written in 1869:

Citrus fruits, it is believed, can be grown here for the Eastern States with good success and profits. It would probably take California fifty years to supply the demand of the United States if her fruit growers were to enter into the business with energy.

The guess was not a bad one in point of time, and yet the guesser, fifty years ago, could have had no conception of the fact that Cali-

fornia could put aboard cars in 1916, 3,366,928,665 citrus fruits, or that the United States could eat so many.

In 1869 the first overland railway was opened and the equivalent of ten carloads of deciduous fruits was shipped to the East: in 1870, 70 carloads; in 1871, 115 carloads and then it was that C. W. Reed, himself a grower and shipper, said: "This business should increase until we can send 1000 carloads." It has, of course, increased a hundred times Mr. Reed's estimate of its attainment, for, counting fruits of all kinds and other perishables like fresh vegetables, we are shipping about 100,000 carloads a year. But we do not intend to pursue that interesting line farther at this time. We simply wish to emphasize the fact that, within the first twenty years of her growth as a State California had changed her plans and purposes, from planting to supply local markets and displace importations, to others which belong to the relation which she has since then assumed to the fruit trade of the country and of the world.

Points of View in Planting.—Our purpose hitherto in this writing has been to show as strikingly as we can, the fact that conditions governing fruit planting in California have changed radically during the evolution of the industry and that they have generated new purposes and points of view to which every planter should give careful consideration, in the light of his own observation and experience and in connection with the best suggestions he can get of broader wisdom. We offer a few hints for the planter to broadly accept and, perhaps, definitely reject, if his particular circumstances warrant the latter course. We advise a short coat for horse-back riding and yet, if the reader has rheumatism in his shanks, he may find long coat tails very cosy to wrap around them. And so it must be with fruit planting, and all other farming operations, because farming is a matter of individual intelligence and

judgment and not of blind adherence to rules and formulas. The "farmer's almanac" has lost its standing as a classic. Let us therefore discuss a few "planting precepts" in the light of California experience.

"Plant what is best for your soil."—This is a very old saw-cut of wisdom, and is sometimes really wise. It does not, however, settle the question, for several reasons. Good fruit soils, which alone should be chosen for commercial fruit growing, are often equally suited to a number of fruits if roots are wisely chosen and the local climate favors. There is, then, no best of all fruits for a good soil but, probably, several best and therefore the old saw cuts nothing. Trying to shift the burden of the choice from your own intelligence to the soil will not work, unless you have a soil so bad for fruit that it will destroy all but one kind, and such land should usually not be planted to fruit at all.

"Plant kinds of fruit which others are not planting."—This is another old chunk of unwisdom, under present conditions in California. It was worth considering in early days when planting was to meet the local demand and it may still be a principle of some value with those who are planting for supply of nearby towns, resorts or hotels or in localities whence fruit wagons run to the mountain camps. Though diversity in production may help peddling, too much of it renders great commercial development of a district impossible.

"Plant varieties which others are not growing."—This seems, on its face, to scintillate with wisdom, but, really, the pursuit of this maxim has cost California fruit growers the loss of much time and money and has impeached their horticultural morality, for it has transformed many investors, who could have been straight producers, into a bunch of grafters. Every man may make mistakes, of course; and he should graft them out as soon as possible, but to start on a lifetime of that work is to invite weariness and failure.

"Plant novelties before others get them."—If novelties were really what introducers represent them to

be, this precept would nearly settle the vexed question of what to plant and would establish fruit growing as the most progressive and least uncertain of all pursuits of mankind. But most novelties are not what they are represented to be or to be good for—not because introducers are intentionally deceitful but because they are ignorant. They usually do not know what the novelty really is, for no sufficient practical test has been made of it and they do not generally know what large commercial requirements of characters and qualities of the kind of fruit, are. The result is that the planter of a novelty has to find out all these things for himself afterwards. Therefore the large planting of novelties is not a well-founded commercial operation at all. Every planter should plant a few most promising novelties, of the kinds of fruit he is interested in, but he should not depend upon them until he has proven them successful in some sufficient way.

Such are a few of the old precepts for guidance of planters which are still very useful to amateur planters and to those who may plan small production for home use or for particular local markets, but they are misleading to commercial planters, for some of the reasons which will be stated.

Precepts for Commercial Planting.—A few hints of points of view for commercial planting at this stage of the development of California fruit growing, may be noted as follows:

Plant the fruits which have been demonstrated in your district to serve some good commercial purpose. This not only determines local suitability of soil, moisture supply, heat, etc., for those fruits, but it also determines selling quality, which, from the point of view of income, is even more important.

Plant for quantity, not for diversity.—Experience has clearly shown that in California it is essential to have not only good, commercially serviceable fruit, but plenty of it. All large commercial transactions are based upon the present availability of considerable quantities of

and developed by Mr. C. W. Ward, a Prominent Nurseryman, and is Designed for the Growth of Every Variety of Ornamental Plant.

satisfactory goods and all anticipations of extension of trade depend upon continued and enlarged supplies of exactly the same goods upon which efforts and expectations are projected. This is true whether the trade-building is done by the packing and merchant class or by associated effort of growers. Unless this is assured by wise, progressive planting to enlarge supplies of recognized standards of style and quality, neither private nor co-operative trade-effort is worth while.

Do not fear oversupply of proven fruits. Questions of oversupply have always arisen and they always will arise. If croakers had determined the course of California fruit growing, planting would have stopped fifty years ago and the present State of California would be losing over a hundred million dollars a year. But, as shown above, the pioneers had faith and foresight and we should be grateful to them, for, really, fruit planting had a much worse outlook fifty years ago than today. Their prophecy was based on faith: we prophesy from demonstration—the accomplishments of a great, elastic industry. Of course there will come times for going slow. When arbitrary and artificial conditions are forced upon the aspect of a fruit, as is now the case with the grape, one should wait for the skies to clear. For it must be remembered that confident and rational extension does not mean plunging.

Do not plant many varieties. It is not only necessary that the fruits planted should be the kinds upon which the district is making good, getting a name and building up handling capacity, but the varieties of each such fruit should be of the type which rules in such achievement. In the nature of things there should not be many varieties. It is rational to select for the improvement of the type and to introduce new varieties of the same type which may be more prolific, immune to disease, of different ripening season, etc., but the fruit grower should guard against introduction of types not so acceptable to shippers, canners and evaporators just as zealously as the live-

stock breeder guards against outcrosses which destroy his types. From the point of view of commercial uses there are many varieties which are mongrels—no matter how beautiful and toothsome they may be.

Do not lather around after the most profitable fruit. There is no most profitable fruit. All the fruits which have attained commercial importance in California have, at some time or other during the last thirty years, reached about the same acre-value in production. We have kept an eye on acre-values produced and our conviction is that the high figures are not far apart and the average net returns, counting investment and cost of production, are not widely different. The main thing in planting, then, is to get what is a "going" fruit in your district, for which local culture points and policies are demonstrated and for which capable selling institutions are established or being developed by co-operative effort.

Do not pay too much attention to "neglected fruits." You are, probably, on the whole not much smarter than all other people combined. If fruits are neglected or not largely grown, there is some good reason for it. If the enthusiastic Governor Downey had had his way we would now have more pomegranates than peaches in California and not be able to sell a carload of them. Do not, therefore, place too much dependence upon your own brightness nor the clairvoyance of others. Plant the fruits which have made California great and which California is making greater in public esteem by her large, standardized production and by her generous, organized effort for publicity and patronage.

In a way, the last half century has been a trial-period to determine the survival of the fittest, culturally and commercially. For assured income the State should grow more of the fruits which are now profitable; the district should plant more of the same fruits for which its own achievements have demonstrated local suitability and commercial outlet; the individual should plant more of the same fruits he is now suc-

New Nursery for California.

For two or three years, near Eureka, Humboldt county, C. W. Ward has been steadily at work building up a great ornamental nursery. Very little has been said of this enterprise, but the pictures above speak eloquently of the immense amount of work done. These illustrations, taken together, make a panorama of what will be known as Cottage Gardens' Nurseries. At this time there are growing on these grounds 75,000 Indian azaleas, of which 10,000 are in bloom; 50,000 rhododendrons; 1,500,000 Holland bulbs; 10,000 boxwoods; 10,000 Hollyberry trees; 100,000 conifers; 2,500,000 Australian, Chilean, New Zealand, Asiatic,

African, and Japanese plants and coniferous evergreens. Mr. Ward is one of the prominent ornamental nurserymen of this country, and has for years conducted a large plant at Long Island, New York. He believes that the combination of leaf-mold soil and moist climate of the Northern California coast are ideal for the great nurseries his company is building up at Eureka. From this plant will be sent bulbs to the trade at least six weeks earlier than is usual. Not only will the trade of the Coast be catered to, but a national advertising campaign is expected to bring orders from everywhere.

cessfully growing—diversifying only to secure a longer and easier harvesting season, viz.: to get more days of profitable work from his outfit of labor and appliances, and then his choice of other fruits should be restricted to those which are well grown and handled in his district. This is the straight and narrow path in commercial fruit growing and too much light cannot be thrown on it. Mankind is naturally so prone to wander, that one does not need to set up electroliners along the boulevard of heterogeneous and self-luminous undertakings and investments.

WINTER-PLANTED STRAWBERRIES BEAR FIRST SEASON.

[Written for Pacific Rural Press.]

Early strawberry planting cannot be too strongly emphasized, in the opinion of Dr. J. B. Cutter of Santa Cruz county since an experience he had last spring with a two-and-a-half-acre patch.

The ground for this patch had been thoroughly prepared before January 1 and was in fine condition. Accordingly, planting was started on that date and a small part of it completed when the heavy rains started. These continued so long and incessantly and then stopped so abruptly that the soil had to be ir-

rigated and reworked before the rest of the field could be planted in May.

All of the vines have put on a fine growth, but the early planted ones have produced exceptionally heavy for first year's planting while the later planted ones haven't produced any berries.

HORTICULTURAL LAW REVISION.

The Visalia Convention's committee on revision of our horticultural laws met in Sacramento September 20 and enlarged the standing committee by the addition of the following names to list published on page 293 of our issue of Sept. 16, viz.:

Harry Chase, Riverside; C. C. Chapman, Fullerton; R. C. Allen, Bonito; James Mills, Willows; Harris Weinstock, Director State Commission Market; Chas. W. Paine, Secretary State Agricultural Society; E. N. Richmond, San Jose; E. A. Gammon, Hood; John E. Gardner, Watsonville; Mr. Yerxa, Princeton; Carlyle Thorpe, Manager Walnut Growers' Exchange; Geo. W. Pierce, Davis; W. D. Russell, Davis; James Madison, Associated Raisin Company; B. B. Meek, Oroville; D. D. Sharp, Co. Hort. Com., Riverside; Roy K. Bishop, Co. Hort. Com., Santa Ana; William Wood, Co. Hort. Com., Los Angeles.

Other appointments, representing other interests, will be made later.

Livestock Facts and Fancies---II.

[By the Editor.]

As was suggested last week, the final test of the value of purebred animals must be their contribution to the industries which are based upon their powers and products and to the prosperity of the farmers who invest their time and money to give the world more and better food.

It is therefore the function of the breeds of cattle to enable the farmer to produce more and better meat and milk; of the breeds of sheep, to produce more and better wool and meat; of the breeds of hogs to produce more and better meat; of the breeds of poultry, to produce more and better eggs and meat; of the breeds of horses, to produce more speed and power, etc. And all these functions, and others like them, are attended by four fundamental abilities: (a) to do these things more quickly than scrub animals can do inferior things; (b) to make better use of the food which is furnished them; (c) to give the man joy and satisfaction in their beauty, style and form as correlated with their producing abilities; (d) to possess the power to transmit their characters with surety to their offspring.

Some of the principles, upon which the service of purebred animals to mankind rests, were discerned in prehistoric times; more of them were demonstrated later and are found in the earliest agricultural records; later still others were brought to light, until finally, within the last few centuries, "modern breeding" arose, on the basis of experience, and gave the world the beginnings of the breeds as we now know them. Since that time there has been developed a science of breeding, on the basis of experience, penetrating observation and the establishment of records—this foundation being more recently illumined by the general achievements of natural science and, more recently still, endowed with exact knowledge, by systematic research and practical experimentation.

Thus we have in a nutshell, two great facts in the general advancement of agriculture and in the increased prosperity of individual farmers, viz.: what the purebred animal may be expected to do and the art by which the farmer of the present day may realize that expectation in his own experience. Evidently it is a great, serious proposition which it is the duty of a man or woman to ponder deeply, to study diligently and to act upon carefully, intelligently and resolutely. But there is this encouraging fact about it, as shown by centuries of experience, that the greatest attainments in breeding have not been reached by the profoundest scholars in the art and science of their day, but by the plain people who have come nearest to living with their animals and have by close and continued observation of their forms, functions and behavior caught gleams of truth in the light of which they recognized variations toward improvement and ways to attain it. In this way our now popular breeds were established and in this way also they may still be handled to the greatest advantage of the greatest number of people. Therefore it should be clearly rec-

ognized that the promotion of improvement in livestock does not consist in collection of ring-side gossip or in tabulation of prices of best-sellers or in being hailed as a good-fellow by the "fancy" and a good player at their game. All these things are pleasant enough and sometimes teach lessons of great shrewdness, but they are not the best contribution to the understanding of animals and the appreciation of what they are really worth as factors in a reasonable producing plan or enterprise. One must study animals for himself, at fairs, in his neighbor's fields and his own, and read what is being done with them in practical ways. Unless he has a lot of direct contact of this kind, much livestock gossip is likely to mislead him and without such contact he is apt not to be a safe or wise buyer on his own account because he lacks practical wisdom in selection. Without knowing a thing for himself, from the inside outward, he is as little qualified to choose ancestors for the type of animals he wishes to get as he would be to select movie kings and queens for a film factory.

We see no chance for benefit from promotive work to help the purebred interest, and the interest of those who buy purebreds for the producing use of them, unless it is undertaken on a serious, systematic, educational basis. This is what the agricultural colleges have done and they have succeeded in multiplying the value of purebred animals to practical people during the last two decades. This is what this journal has tried to do ever since its founders, forty-six years ago, saw the general improvement of the common stock of California by the changing forms of cattle, sheep, hogs and horses by the introduction of the best breeds of the day by the pioneers and their use upon the Mexican types which they found here. And this is what we are still trying to do now, when purebreds and improved grades have become dominant in the eyes and thoughts of Californians. The suggestions which we give to our special writers on these subjects are embodied in the very common and yet very expressive phrase that to be worth record in these columns animals "must not only be good but good for something." And this, it seems to us, is the only reasonable basis on which to promote the purebred interest. If this interest does not cling to the fundamental ideas of producing animals with such potentiality of practical benefit and of getting the prepotency of the purebred into the possession of practical producers at prices which improved production warrants, those who give their time and money to breeding and distributing purebreds might as well be swapping jackknives, so far as State development and individual prosperity of farmers are concerned.

Next time we shall try to give a few hints of opportunities and of recent instances showing why it is now more promising than ever to minister to practical standards of value and to make the means of reaching such standards more available.

The Big Holstein Sale

At Hanford, Cal., October 18, 1916

The Place to Buy Good Holsteins

**100 Head Registered Cows and Heifers
A Few Choice Young Bulls**

No better opportunity will be presented this fall for the purchase of good dependable foundation stock. Tuberculin tested.

R. F. GUERIN, Visalia, Cal., has a choice consignment including several high record cows, one of which is the dam of a 27.42-pound 4-year-old and another has a 24.88-pound daughter. They are bred to a 30-pound son of SIR VEEMAN HENGERVELD. He is also selling his senior herd sire, ARCADY PONTIAC WAYNE HENGERVELD, sire of 24 A. R. O. daughters, including a 27-pound 4-year-old.

K. W. ABBOTT, Milpitas, Cal., will sell some splendid cows and heifers, including a 26-pound cow; a 24-pound daughter of a 23-pound cow and two daughters of a 24-pound cow, sired by a son of IGNARO DE KOL. A special feature in this consignment will be two sons of his great herd sire, COLANTHA SIR PONTIAC AAGGIE from 26 and 27-pound dams. Cows will be bred to COLANTHA SIR PONTIAC AAGGIE.

ALEX. WHALEY, Tulare, Cal., is selling some choice heifers of select breeding and type from A. R. O. dams with records as high as 23 pounds. They are in calf to SEGIS PONTIAC DE KOL BURKE LUIT, whose dam has a record of 32.76 pounds butter in seven days with second calf and whose sire's dam is RIVERSIDE SADIE DE KOL BURKE, 32.29 pounds.

W. F. MITCHELL, Visalia, Cal., consigns a number of A. R. O. cows and heifers, all of which are young and carefully selected, as representative of his herd. They are bred to a good son of SEGIS PONTIAC DE KOL BURKE and are likely candidates for large records.

W. H. GINN & SONS, Corcoran, Cal., have entered in the sale a most attractive lot of young cows and heifers, including a daughter of a 30-pound cow and several daughters of their herd sire, who is by one of the best sons of KING OF THE PONTIACS. They represent the choice of their herd.

THE TAGUS RANCH and G. H. LOUGHERY, Tulare, Cal., have a large entry of select animals in the sale, consisting mainly of young cows in calf to approved sires, one of which is a son of KORNDYKE QUEEN DE KOL'S PRINCE from a cow with a record of over 700 pounds butter in a year.

T. J. GILKERSON, Lemoore, Cal., consigns fifteen young cows, mostly with first and second calves; sound and right. These are bred to ARAIA PONTIAC DE KOL SEGIS, a remarkably fine young sire whose dam and sire's dam average over 1000 pounds butter in a year. This consignment includes a prize winner at Panama-Pacific Exposition.

CHAS. YOCUM, Tulare, Cal., has a small consignment of choice animals, including a 22.62-pound cow bred to SEGIS PONTIAC DE KOL BURKE LUIT, whose dam and sire's dam are 32-pound cows.

A. W. MORRIS & SONS, Woodland, Cal., are selling some well-bred heifers and young cows with official records as high as 25 pounds butter in 7 days and bred to such sires as SEGIS PONTIAC DE KOL BURKE; KING MORCO ALCARTRA and KING MEAD OF RIVERSIDE. There will also be included two young bulls of serviceable age whose dams have records of 33.54 and 31.78 pounds butter in 7 days, one of which is a daughter of De Kol Burke, the sire of seven daughters above 30 pounds.

Sale catalogs will be ready about October 1st and will be mailed on request.

California Holstein Breeders Third Annual Sale

Col. B. A. Rhoades, Auctioneer.
Los Angeles, Cal.

F. L. Morris, Sales Mgr.
Woodland, Cal.

POLAND CHINA SALE AND MEETING.

[Written for Pacific Rural Press.]

The wider distribution of good Poland China hogs among farmers, at a fair price to both buyer and seller, was the object and result of the first annual auction sale, held under the auspices of the Poland China Breeders' Ass'n of North San Joaquin Valley at Modesto, September 20.

The average of \$42 for the 28 head sold was not a high one but it was a price which proved attractive to a number of farmers situated in various parts of the State and one at which breeders can practice a live and let-live policy, the two fundamental purposes of the association under whose auspices it was held.

As has been customary at previous hog sales, females were more in demand than males, the 23 head that were sold bringing an average of \$44 while the five boars brought an average of \$32.

The highest price was \$85, paid by H. I. Marsh for a two-year-old sow consigned by W. A. Young. L. L. McCracken of Ripon was the largest buyer, securing seven head for \$232.50. Mrs. Ella C. Maze of Modesto was the next heaviest purchaser, securing five head for \$222.50. Olsen and Jones of Merced county secured three head for \$97.50. Other buyers were University of California; M. Bassett, Hanford; J. M. McKindley, Acampo; Frank Palmer, Davis; C. C. Potter, Lemoore; J. A. Groves, Farmington; J. A. Clark, Lodi; N. Spitz, Keyes; O. Linn, Modesto; N. Hutt and W. L. Bowron. T. G. Gilkerson and Emerson Bone were the auctioneers in charge of the sale.

The night preceding the sale the association held a banquet and get-together meeting at which representatives of the Kings County Poland China Breeders' Ass'n were present as well as outside visitors from other points.

After listening to an interesting program steps were taken toward the formation of an association to be known as the California Poland China Breeders' Ass'n, two delegates being appointed by the North San Joaquin Breeders' Ass'n, who will confer with two delegates from the Kings County association at Hanford, during the State Swine Breeders' Association's meeting October 5. If the plan for the State-wide association can be perfected by these delegates a general meeting of all Poland China breeders will be called for October 18 at Hanford, the date of the second annual sale of the Kings County Poland China Breeders' Ass'n.

SHEEP QUESTIONS.

To the Editor: I am changing from cattle to sheep and would like to know how many bucks to use per 100 ewes. Do sheepmen wean lambs the same as calves in the fall? Are shears or clippers best for shearing? W. T. J., Shawmut.

[Answered by Prof. R. F. Miller, University Farm, Davis.]

[Most sheepmen figure on 3 bucks to 100 ewes when the sheep are on range; while under farm conditions, this number might be reduced to two. Lambs should be weaned in the fall the same as calves; and where producing lambs for the early

market, they should be bred during January and February. The lambs are sold direct from the mothers. Furthermore, buck lambs and ewe lambs must be separated after 4½ or five months.

Clippers are being used a great deal among the range sheepmen, as they clip the ewes so much shorter, there is less danger of cutting the sheep with the clipper, and a greater

number can be turned out in a day. The old hand shears are still used considerably and a great many professional shearers like to use their own tools.]

Jack London requires visitors who enter his pig pens on a tour of inspection to apply some germicide solution to the soles of their shoes so that no contamination may be conveyed to his swine.

ROUGH'S Greenfields

ARLINGTON STATION,
RIVERSIDE, CALIF.

An Outstanding Fair at Modesto.

[Written for Pacific Rural Press.]

There was no one greatest thing about the Modesto Livestock Show and Exposition, held at Modesto last week, unless it was the enthusiasm accorded it by exhibitor and visitor alike from all parts of Stanislaus and adjacent counties.

The livestock show was a headliner, and unquestionably the best one that has ever been staged at a county or district fair in California, but the agricultural, horticultural and industrial exhibits have never been excelled in beauty and quality at any State or county fair in California.

Livestock.—The most conspicuous features of the livestock show were in the dairy cattle and swine divisions, the branches of animal husbandry from which Stanislaus farmers derive most financial return.

Not alone in numbers did both swine and dairy cattle excel but in quality as well, many herds of both being present that had been State Fair contenders. But in neither case was it a walk-away for the older herds, the unknown herds, even in inexperienced hands, oftentimes

J. W. Benoit.

Ayrshires were shown in goodly numbers by Steybrae Farm, and Milking Shorthorns by Alexander and Kellogg and H. L. and E. L. Murphy, all of whom duplicated the excellence of the State Fair show in these divisions.

Poland Chinas and Durocs outdistanced the other breeds of swine in point of numbers, State Fair material being shown in each breed. In Polands H. I. Marsh took grand championships with his herd boar Model Major and an outstanding big type aged sow. Lack of fitting was noticeable in this division which undoubtedly affected the winning records of some younger breeders, who were nevertheless strong contenders.

In Durocs there were three 1916 State Fair Show herds and the going was far from easy in any class, younger breeders bringing out a surprising lot of competition and taking their share of the prizes.

Daggs' Goodenough, champion at Sacramento, was too good to beat for grand championship, as was the aged sow shown by J. E. Thorpe,

Purebred Livestock was an Outstanding Feature at the Stanislaus Fair.

capturing the much sought for blue ribbon. This argues well for the quality of livestock on Stanislaus county farms.

Jerseys were the sensation of the show in numbers, and presented no easy task for Prof. Gordon H. True who did the judging. The more experienced showmen carried off championships, but each class was hotly contested.

Altama Interest, owned by Guy Miller, was given championship honors in bulls with S. F. Williams' Golden Maidkin's Boy as reserve.

In championship cows the unforeseen happened when the junior calf, Valet's Foxy Blondy of L, shown by N. H. Locke Co., was hoisted into first place, lacking a single hole for criticism in Prof. True's estimation. She was hard pushed however by Cygna of Venadera shown by Miller.

The Holstein show was essentially a Stanislaus county event, no outside counties competing and none being needed to establish a uniform high quality exhibit in each class.

In championships, the bull Cornelia King, shown by B. F. Anderson, won out against such strong competition as the second prize aged bull at Sacramento. Female championship went to Koroba Electra, a handsome aged cow in the herd of

although there was decidedly stronger competition in the female class than in the male.

Though smaller in numbers, the Berkshire show was high in merit, two herds that were contenders at Sacramento this year being on hand together with several smaller ones. The surprise in this division was sprung when Prof. R. H. Miller put the young boar, Premier Leader, shown by G. N. York and Son, ahead of Rival's Robinhood 2nd, the State Fair grand champion exhibited by H. L. and E. H. Murphy. Grand champion sow went to an aged sow in the Murphy herd.

Yorkshires were shown without competition by Riverina Farms and most of the awards in Chester Whites went to N. H. Locke Co. without competition.

Agricultural, Horticultural and Poultry.—All of these exhibits were housed in big tents, the agricultural and horticultural exhibits being composed almost entirely of fresh products gathered and shown by the various communities of Stanislaus county. The districts represented are Ceres, Keyes, Turlock, Patterson, Oakdale and Hughson.

Some of these exhibits were highly diversified in nature while others were made up largely of one par-

The REMCO SILO

Made of Air-Dried Redwood The Standard

Mr. A. L. L. Dairyman,
Everywhere, Calif.

Dear Sir:

What would you give for Green Pasturage the year around? If you had it you'd make a lot more money, wouldn't you?

You can have it or its equivalent, **THROUGH SILAGE**, at less cost in labor and money than through natural pasturage, almost without regard to seasonal conditions and dependent only upon your own efforts.

Corn is not the only crop for silage. Feterita, Milo Maize and Other Sorghums, Barley, Oats, Alfalfa, Vetch and Cowpeas all make good silage.

You do not have to wait until next fall to profit from a silo. Fill it in the spring with fall-sown grain or the first cutting of alfalfa, and insure against such losses as you had this season. Ask us about it.

HOLSTEIN CATTLE
Purebred Registered
Holsteins in Canada have far surpassed all other dairy breeds in numbers, milk and butter records, and in popular esteem. The membership of the Canadian Holstein Association has more than doubled in the past four years, and Holstein cows have led all breeds in the total amount of milk and butter produced in a year and also in net profit. Wherever you find them, Holsteins are proving the greatest profit makers for the farmer or dairyman. There's big money in the big "Black and White" Holsteins. Send for FREE Illustrated Descriptive Booklets. The Holstein-Friesian Association of America.

ticular product. Such was the case with Patterson, whose only exhibit was alfalfa hay. Turlock was more general with melons, corn, grapes and nuts as headliners. Ceres and Keyes had a variety of products shown, fresh and dried fruits, melons and other field crops being most in evidence. Almonds were given the place of honor in the Oakdale exhibit with rice a close second, while Hughson came in strong with beets and tobacco. An abundance of Indian corn and sorghums was in evidence at every booth.

Besides the community exhibits of agricultural products there were a number of industrial exhibits which featured farm crops. These were interspersed with a varied and tasty lot of exhibits shown by merchants and manufacturers from all parts of the State. Automobiles commanded attention in a tent erected exclusively for that purpose.

Poultry was well represented both in numbers and quality and in keeping with the importance which poultry raising is commanding on the farms of Stanislaus county at this time.

The attendance was a gratifying feature to exhibitors and managers, ranging right around 5,000 a day.

DRIED BEET TOPS FOR CATTLE.

[Written for Pacific Rural Press.]
With a sugar beet acreage that has seldom if ever been equaled in the State, it is certain that a great many farmers will be interested in finding some more profitable use for the beet tops than plowing them under.

On Frampton Brothers' ranch in Los Angeles county these tops are made into a valuable by-product by gathering them in the field and storing them for cattle feed. When carefully piled and kept dry on both the top and bottom to prevent moisture gathering, they may be stored almost indefinitely and fed as required. On this ranch they form the principal part of the helper and dry stock ration for several months of the year in connection with alfalfa hay and bean straw in small proportions.

Although the tops are also valuable for pasturing and are usually fed this way in many beet-growing districts by beef cattle raisers, it would seem profitable for beet growers with dairy cattle to cure them in the above manner, especially in view of the present high feed prices.

DUROC SALE CALLED OFF.

Inclement weather combined with a superfluous amount of counter attractions, wild west shows and peanut vendors were all factors in the calling off of the annual sale of the Stanislaus County Duroc Breeders' Ass'n at Modesto last week after nine head had been sold at prices up to \$87.50.

Not only did the weather prove a discouraging factor in the sale but also kept breeders from other parts of the State from attending the meeting and banquet the night previous, which was to have been held for the purpose of organizing a Western States association.

Petaluma will try to secure the 1917 convention of the California Creamery Operators.

SANTA ANITA RANCHO
ANOAKIA BREEDING FARM

FIRST ANNUAL SALE, OCTOBER 23rd and 24th.
ARABIAN THOROUGHBREDS: Two-year-olds, sired by Imported Stallion Ibn Mah-russ, head of our Arabian Stud. Dams are the choicest thoroughbred mares of Santa Anita Rancho.
SADDLE HORSES: Fourteen of them, some of which are sired by Ibn Mah-russ, world renowned imported desert saddle stallion, and Don Costano, a five-gaited Kentucky saddle stallion. These horses are mostly three-year-olds.
POLAND CHINA AND BERKSHIRE BOARS: Four to nine months old. Sired by famous Poland China herd boars—Banker's Boy and Glenview Wonder. And Berkshire Boars—Kintyre Laird, Grandson's Duke and Fashion's Longfellow 5th. The dams are from the very best blood lines. Most all these animals have winnings at World's Fair.
HOLSTEINS: We will sell a number of young bulls. Some sires and grandsons of the noted Prince Gelsche Walker, and bulls from one World-Record cow and two California State-Record cows. Sixty females of the highest class will be consigned.
WORK HORSES AND MULES will also be offered for sale.
WRITE FOR PARTICULARS.
Anita M. Baldwin, W. H. TAYLOR, Superintendent.

BASSETT'S POLAND CHINAS

For many years, at widely separated show rings, under many different judges of varying type ideals, my Poland Chinas have been consistent prize-winners. My herd is large, and I cull closely. The animals sent out as breeders are the very tops of a large number. I KNOW that my kind of Poland China is a profitable farmer's hog, for I send carloads of them to the packer every year—uniform in size, high in quality, quickly and economically matured and finished.
Young Stock, \$30 Up.
M. BASSETT.

Live Stock and Dairy Notes.

(Livestock breeders all over the State are invited to send on postal cards, notes regarding their sales, State and County Fair intentions, new stock, etc.)

DAIRYING AND DAIRYMEN.

W. G. Larue of Yerrington, Nev., purchased two young heifers of the prize winning Churchill Creamery herd at the Nevada State Fair.

Geo. A. Smith of Corcoran, who was severely injured by a bull on the day of his sale last fall, took an auto trip to Fresno with W. H. Ginn recently.

The cattle reported in other columns as having been bought at the Rio Vista Farm Sale by A. R. Magruder were bought by himself in partnership with Karl A. Gotchall.

A feature of the Rhoades-McAllister Sale was the large number of cows bred to King Segis Pontiac Jannek. There is a standing offer of \$150 for every heifer calf by this bull, at four months of age.

The Potter dairy herd at Santa Barbara of 250 grade Jerseys, Holsteins, and Durhams is to be added to by the purchase of 50 head of pedigree stock made at the Sacramento State Fair.

The Simon-Newman Co. have started to test their 700 dairy cows both for tuberculosis and butterfat. E. W. Stanton of Gridley has purchased a herd of 35 Holsteins from Supervisor Russell of Yolo county.

The report of the Orland Cheese and Butter Company for August is considered good for this season of the year. The monthly pay roll is over the \$10,000 mark; and the total number pounds of butter sold, 42,365.

The 1916 National Dairy Show will be held in Springfield, Mass., Oct. 12 to 21 inclusive. The association has gone to get together the greatest national show of dairy cattle and dairy products and machinery ever held in the East.

Creamery managers who have shipped poor grades of butter east the past summer have been severely penalized in price, according to one large operator and it is his prediction that a continuance of this practice will invariably result in a loss to the shipper.

Jersey breeders held an interesting meeting during the Modesto Livestock Show and Exposition last week. J. M. Roberts, California Field Agent for the American Jersey Cattle Club, was present and was promised the hearty support of all Jersey breeders present.

Farm Adviser Dougherty of Imperial county is conducting a cow testing association campaign among dairymen of that district. He reports a sufficient number of cows already signed up for one tester and expects to be able to get enough for two testers before the association is organized.

The Sacramento Valley Development Association is considering a plan of organization for the milk producers of the Sacramento Valley. It is claimed that the distributing companies of Sacramento are paying the producers of the valley 7½ cents per gallon for milk and selling it for 40 cents per gallon.

The coming world's record cow is believed to be Moseita Mutual De Kol Juliana, owned by Santa Anita Rancho. Her record nine months along in the official test was 1003 pounds butter from 24,150 pounds milk and she was giving about 60 pounds milk per day then, according to Supt. W. H. Taylor of the Rancho. The official world's record is about 1015 pounds butter.

Cows producing over 50 pounds of fat in the Yolo-Solano-Colusa Counties cow-testing association for the past month are: O. P. Gillian (Durham), 65.55; E. Beebe (Holstein-Jersey), 59.83; W. W. McNair (Jersey), 57.25; G. B. Isham (Holstein), 57.06; F. Beckley (Jersey), 56.44; C. E. McCarty (Durham),

55.06; O. P. Gillian (Holstein), 50.84; J. Watson (Holstein), 50.75; B. L. Greene (Holstein), 50.59.

Arizona dairy cow buyers who have been operating extensively in California the past year state that Arizona dairymen are demanding a better quality of cows and that it is becoming more difficult to dispose of culls even at a much reduced price. The government has been a heavy buyer of alfalfa hay in the irrigated districts, thus forcing up hay prices to unheard of figures.

HORSES.

J. D. Faugh of Tulare recently shipped a carload of horses to Portland, Maine.

Ernest Sullivan near Winnemucca, Nev., shipped five carloads of horses to East St. Louis recently. I. J. Davis shipped one carload of horses to Chicago.

Two purebred Shire mares which were on exhibition at the State Fair at Fallon, Nev., were given to the University of Nevada by Geo. Wingfield and will be placed on the Farm.

The Rio Vista horse and colt show held last Saturday was very successful. The numbers of horses entered in competition was larger and the attendance was greater. Prof. True judged the animals, giving to Ed Westgate the championship on his Shire stallion and the same honors to the Blackhawk Stock Farm on their Belgian stallion.

BEEF CATTLE.

Four hundred head of cattle from Nevada consigned to the Porterville Alfalfa Co. reached that town recently. They are to be fattened and sold.

Hayes & Devaney of Alameda county moved about 200 head beef cattle from their range on the Carson ranch at San Joaquin City to Martin Lund's ranch near Clifton Court.

Paderewski, the Polish pianist, is the latest celebrity to engage in the stock business in California. He has chosen a picturesque spot in the rolling foothills of San Luis Obispo Co.

H. T. Holley, superintendent of the Patterson Estate Co. of Alameda county, has moved over one hundred head beef cattle from the ranges to the company's land where they will be topped off on alfalfa.

Stockmen from all parts of Humboldt Co. will gather at Fortuna on Oct. 7. It is planned to make the breeding of high-grade stock, increase in the efficiency of the ranges, and similar problems part of the regular program of the association.

It is reported that the island of Lanai, one of the Hawaiian group, has been purchased by U. S. Senator Key Pittmann of Nevada and a group of wealthy Nevada cattle men, for about \$1,000,000. Cattle will be sent with which to stock the island.

One of the largest cattle deals put through in Tehama county this year was consummated recently by McKenzie & Stover. They sold to the Miller & Lux Co. 1300 head of steers and 240 head cows. Of this number, 750 head beef cattle went to the San Francisco market and the balance of the stock was shipped to the Miller & Lux ranch in the San Joaquin Valley.

Easton and Ward, owners of the Blackhawk Stock Farm in San Mateo county, announce that they have purchased a 1200 acre stock ranch near Danville, Contra Costa county. They expect to erect modern buildings on this property at once and stock it with purebred Shorthorn cattle and Shire horses. The Shorthorn herd will be purchased in England as soon as war conditions will permit.

LIVESTOCK DIRECTORY.

Rates in this directory, 3c per word each issue; or if carried weekly for one year, 2½c per word.

SWINE.

Poland Chinas.

SMITH'S POLAND-CHINAS—Sows and gilts bred to Joker, First Prize Boar at the Wisconsin State Fair, 1915. These sows and gilts, sired by Iowa Wonder, who is a son of A. Wonder, the most celebrated Poland-China boar, living or dead. Litters from this mating are the best I have ever seen anywhere. Prices low quality considered. Will sell one or a carload. As a special inducement each purchaser will be given a year's subscription to the American Swineherd, the best swine paper published and a copy of the Handbook on the Sow; also a copy of the Pig Feeders' Manual. Geo. A. Smith, Corcoran, Cal.

YOUNG POLAND CHINAS, LARGE TYPE—Boar IBA Wonder won first and Reserve Championship at E. E., weighing 730 pounds under 2 years and breeding condition. 60-day special—fine young sows bred to IBA Wonder at very low prices; also weanling pigs, either sex. Satisfaction, or money refunded. W. A. Young, Lodi, Cal.

POLAND-CHINAS—Bred gilts, \$15; young boars, \$10 and \$15; bred sows, \$25. Weanlings, either sex, \$6. Registered and crated, purchaser to return crates. E. A. Hall, Watsonville, Cal.

REGISTERED POLAND-CHINAS—Prolific, profitable porkers. Choice boars now ready for service, \$25 each. Weanlings, \$15. Dr. J. A. Crawshaw, Hanford, Cal.

LAKESIDE STOCK FARM POLAND CHINAS are money-makers. Satisfaction or money refunded. Geo. V. Beckman & Sons, Lodi, Cal.

POLAND-CHINA PIGS—Sired by "Iowa Wonder," son of "A. Wonder," largest hog living or dead. G. E. Shelford, Healdsburg, Cal.

BIG-TYPE POLAND CHINAS—Stock from the best herds of the Middle West. N. Hauck, Alton, Humboldt Co., Cal.

HOGS.

W. R. Belknap of Tulare has just shipped one carload of hogs to Anaheim.

Hog shippers in Imperial county have found by correspondence with Kansas City butchers that they can dispose of their hogs more profitably in the East at this time than to California packers.

STATE DAIRY COW COMPETITION.

Entry blanks for the California State Dairy Cow Competition are now ready and will be sent to dairy farmers and breeders planning to enter their cows in the competition. This will commence November 1st this year, and cows may be entered any time during the following six months, up to May 1, 1917. The competition bids fair to become an event of the greatest value to owners of dairy cattle and to dairying interests of the State in general. Complete information as to the details of the competition, including the list of prizes valued at about \$7,500 to be awarded for records of production by dairy cows and herds, will be found in Circular 153, College of Agriculture. Like entry blanks this circular will be sent free upon request. Address Prof. F. W. Woll, University Farm, Davis, Calif.

GOOD CATTLE FOR SANTA CLARA COUNTY.

One of the largest and most select importations of dairy cattle made this season is the one recently received by the Palo Alto Stock Farm in San Mateo county from Finnerne Stock Farm, New York.

Included in the lot is the bull King Pontiac Segis Korndyke, a son of King Segis De Kol Korndyke and out of the Beauty Rauwerd De Kol, whose seven-day record was 30.54 pounds butter and who has a 30-day record of 120.98 pounds butter. This young sire has a 41 pound sister, Mabel Segis Korndyke who made her record as a four-year-old and his first 12 heifers to freshen have made better than 20 pounds as two-year-olds. He will be used as herd sire at the Palo Alto ranch. Finnerne Alexis Pontiac another animal in the lot has a seven-day record of 38 pounds and a 30-day record of 135.35 pounds as a three-year old. Four other cows in the lot have records of 30 pounds or better and all of them are bred to King Segis De Kol Korndyke.

Besides the Holsteins Mr. Tichenor shipped out 20 head of imported Guernseys of May Rose and Governor the Chene breeding, all having good show records. These will be used as foundation animals. There are 202 head of purebreds on the ranch at present of which 132 are Holsteins and 70 Guernseys.

MISCELLANEOUS.

SAN FRANCISCO LIVE-STOCK EXPORT CO., Eugene B. Croley, Manager, solicits foreign orders for purebred registered and merit breeding animals and fowls. California has great diversity of climatic and other conditions that enable us to select animals that have been raised under conditions similar to those of the location for which they are intended. We should be informed regarding these conditions and be allowed ample time to make selections. Nearly all disappointments in buying afar are the result of insufficient information as to conditions or to lack of time for proper selection. Our plan and terms for "raising animals to order" to fit into peculiar foreign conditions is worth investigating. References: Dun or Bradstreets, or San Francisco banks. Office 219 Underwood Building, 525 Market St., San Francisco.

CROLEY'S Calf Feed with skim milk will raise fine dairy heifers cheaply. Geo. H. Croley Co., Inc., 631-637 Brannan St., San Francisco.

D. O. LIVELY, 216 Hobart Building, San Francisco, buys and sells livestock—any kind—any quantity.

DUROCS AND GUERNSEY BULL CALVES Gilts bred to 900-lb. boar. Ed. E. Johnson, Turlock, Cal.

DOGS.

THOROUGHbred SCOTCH COLLIES—All bred from our noted prize-winners. Have a few 3 months old puppies—very choice. Write us what you want. Browndale Kennels, Redwood City, Cal.

THE **W** BRAND

Rio Vista Holstein Farm Sale.

[Written for Pacific Rural Press.]

California had not witnessed a dairy-cattle sale containing so many typical animals with such high records of production both for themselves and for their ancestors, as occurred at Rivera when the Rio Vista Holstein Farm herd was dispersed Sept. 19 and 20, along with a large consignment of high-record animals from McAlister & Sons.

One hundred and five head changed hands for a total of \$44,795, or an average of \$426.62 including several calves. Indeed, a spring calf was the sensation of the sale, being bought for \$2,000.

Every animal of breeding age was guaranteed a breeder, and every one of the 105 carried a tuberculin certificate issued by a Deputy State Veterinarian. Four females and three males sold at \$1,000 or over and 21 females and 5 males sold at \$500 or more.

The star of the sale, King Paul Korndyke Vale, a bull calf dropped May 25, 1916, sold for \$2,000 to a syndicate formed during the bidding and consisting of Jas. J. Jeffries, Harlan Dailey, C. W. Anderson, and W. H. Taylor. The calf is by King Korndyke Sadie Vale and out of a cow with a 7-day record of 31.42 pounds butter. Both the calf's dam and sire trace to Sadie Vale Concordia.

Heaviest Buyers.—The heaviest buyer was Jas. J. Jeffries of Burbank. He spent \$8,560 for 17 head including the bull calf mentioned and the highest priced sire of the sale, King Segis Pontiac Jannek. This bull is by King Segis Pontiac with 53 A. R. O. daughters and out of a 29.71 pound cow. Mr. Jeffries is a beginner with purebred Holsteins but expects to have one of the leading herds of the coast. W. J. Higdon of Tulare took the second highest bull for \$1,500. He is Prince Riverside Walker by Prince Gelsche Walker and out of a 28.35 pound cow.

The second largest buyer was the Pacific States Corporation of Tulare. They bought 12 head for \$6,890. These include Forest View Wayne Korndyke for \$1,180 and Whittier De Kol Homestead Rowena for \$1,100. The former has produced 27.93 lbs. butter and was bred to the \$1800 bull. The latter has records of 28.94 pounds in 7 days and 119.95 in 30 days.

A. R. Magruder of Ripon bought 11 head for \$4295 including a two-year daughter of King of the Pontiacs for \$725. Mr. Magruder also purchased for \$510, a cow whose record as a three-year-old is 25.88 lbs. butter.

A. W. Morris and Sons spent \$3940 for 9 head including \$1000 for a two-year daughter of King of the Pontiacs with records of 23.86, 28.41, 25.77, and 25.89 behind her. They also paid \$600 for a two-year daughter of King Hengerveld whose dam made 31.39 pounds. They took a year-old grandson of their Tilly Alcartra for \$550.

H. E. Vogel of Fresno bought 8 head for \$3160 including a yearling heifer out of a two-year 25-pound cow for \$515, and a 26 pound half sister to the \$1180 cow for \$500.

F. W. Hansen of Fresno bought

8 head for \$3125 including Cristeria Overton Mechthilde 4th, the highest priced cow, for \$1300. She made 31.70 pounds as a four-year-old. He also bought for \$500 a yearling heifer out of a 31.70 pound cow.

F. M. Helm of Fresno took 7 head for \$2015; W. J. Lembke of Phoenix, Ariz., 5 head for \$1855; E. P. Fay of Los Angeles 4 head for \$1600 including King Korndyke Sadie Vale 23rd for \$620; H. B. Peake of San Bernardino 4 head for \$1140; R. F. Guerin of Visalia 3 head for \$855; R. Nadeau three head including a week-old calf for \$565; C. E. Bowen two for \$525; J. Y. Oldman of Los Angeles one for \$510; McAlister & Sons one for \$505; G. H. Loughery two for \$415; Earl Sturgis, supervisor of tests on the Santa Anita Rancho, one for \$400; P. H. Krick of Anaheim, a 6-months daughter of the \$1100 cow, for \$315; E. P. Haskell of Montebello, one for \$230; G. C. Waterhouse of Chino, one for \$250; Ginn and Sons of Corcoran, one for \$200; B. F. Taylor, one for \$315; W. F. Eldridge of Corona, one for \$130.

THE FLUSHING OF EWES.

[Washington Experiment Station.]

A shortage of wool and mutton exists which is not likely to be relieved in many years. It therefore behooves those who own flocks of ewes to handle them so as to obtain maximum results, for the harvest will be rich, bountiful and enduring. It is a recognized fact that the condition of the ewe flock during breeding time is largely responsible for controlling the fertility. The condition of the ewes is a far more important factor than that of the ram. Of course, the number of ewes that one ram can serve successfully must obviously depend upon his vigor.

Flushing is the term applied to the practice of stimulating the organs of reproduction by supplying additional grain or more succulent pasture to the ewes. An insufficiency of feed retards the breeding season, and reduces the fertility.

To flush ewes, Professor Wm. Hislop recommends that they be placed in a succulent pasture and fed one-half to one pound per day of two parts oats and one part bran for ten days previous to turning the ram in with them. It is equally important that the ewes be not over fat at this time.

All the wool about the dock of the ewes should be trimmed away before mating. As a means of distinguishing the ewes that have been bred, paint the ram on the brisket with some color that will leave a mark on the wool of the ewe. At the end of 21 days the ram should be painted another color. In this manner the owner is enabled to tell whether or not the ewes are "returning."

HOGS COUGHING.

To the Editor: Some of my hogs are coughing. I have given blue-stone and turpentine with good results but is it safe, and good?—G. G., Pixley.

[Your treatment of the hogs is all right provided it is not carried too far.]

FREE

to all owners of cows

If you keep cows you ought to write for this book

THIS book was written for the man with only two cows just as much as for the man with twenty. In it has been gathered together a great fund of valuable information on subjects which are of vital interest to every cow owner. And while the various phases of dairying are treated by the best and highest authorities, it is not a technical treatise but is written in plain every-day language so that even the children can understand it.

Here are just a few topics that will give you an idea of the practical nature of its contents:

"How a Dairyman Made Good"—a real story of a real farmer, who starting with almost nothing, built up a fine dairy herd and made a big success.

"Year Around Feeding of Dairy Cows"—by an authority whose advice is well worth heeding. The importance of proper feeding deserves more attention from every cow owner.

"How to Judge a Dairy Cow."—shows by illustrations what points to look for in a dairy producer—explains the essential qualifications of a good dairy cow.

"Building Up a Dairy Herd"—a practical breeder gives some sound advice on this important subject.

"The Farm that Won't Wear Out"—shows that the farm where cows are kept, and the fertility returned to the soil, improves instead of deteriorates.

"The Care of Cream on the Farm"—quality is as important as quantity. It costs little and brings big returns.

"Silos and Silage"—one of the best chapters in the book. Full of silage facts that every farmer ought to know.

Then there are splendid articles on "Alfalfa," "Ventilation of Dairy Barns," "Breeds of Dairy Cattle," "Improving the Herd with a Good Bull," "Care of Freshening Cows," "How to Test Cows," etc. Numerous dairy rations, suitable for various sections of the country, are given, and various milk and dairy tables as well as tables of weights and measures, silo capacities, etc. that every farmer has occasion, at some time or other, to refer to.

Thousands of dollars have been spent in the preparation of this book, and if you keep cows you certainly ought to write for a copy and read it from cover to cover. The book is absolutely free. Just fill out the coupon or send the information requested on a post card, mentioning this paper.

Methods vs. Location in Breeding Hogs.

[Written for Pacific Rural Press.]

In the southern part of San Joaquin county, you may find a 2,000-acre grain ranch, 20 miles from Stockton, the nearest large town, with but 10 acres seeded to alfalfa; and that none too productive—certainly not the most ideal location for a purebred swine breeding establishment; yet, despite the unfavorable location, Knob Hill Stock

The third season is stubble season, the hogs now putting hard flesh on the large frames they have formerly developed from breeding and exercise. At times when a field of barley is poor that also is hogged off during the fall months. In December green feed is again available.

This is how Knob Hill Polands are fed and raised. It also accounts

He Tries to Produce a Larger Hog than the Average Poland-China.

Farm Poland Chinas are known the entire length and breadth of the State.

Why this should be true is best demonstrated by a visit to the ranch. If you are looking for frills and fancies you'll be disappointed, for A. M. Henry raises hogs with "horse sense." He believes a home-made affair that is warm, dry, and well ventilated answers the purpose just as well as expensive quarters.

And so you find the brood sows and pigs in large roomy lots on the side of a hill with a home-made house in each lot, large enough to accommodate a sow and her litter. Water and feed trough comprise the other equipment with exception of a concrete-lined wallow, which is provided with water from the kitchen sink. In this wallow also you see the practical rather than the beautification idea, they having been made by shoveling out a shallow hole in the ground and lining it with cement. So also is the ditch that connects the wallows one with another, furnishing an outlet for the surplus water so that it may run through the entire chain of wallows and thus furnish a running stream.

But Mr. Henry isn't much of a believer in housing hogs under his conditions. He is a crank on good heavy bone; and while he can and does breed this into his herd by the judicious selection of herd sires, the development of it comes through exercise over the hill pastures and stubble fields.

Probably few breeders are so well situated to give their hogs this bone and muscle building range as is Mr. Henry; for it is only during the short interval between the middle of May and grain harvesting that he does not have pasture for the hogs to run on.

This is accomplished by dividing the year into three seasons; the first one being between December and the middle of May when the herd is run on either wild green feed or on fields that have been especially planted for them, this being governed by the season. The second season is the farrowing season, the hogs now being taken up to be fed till harvest time and the sows to farrow their litters. Good feeding is practiced at this time; a combination of oat screenings, wheat, Egyptian corn or broom corn, some bran and tankage, together with charcoal and salt at all times.

may develop into a big hog quickly, he must have a good coat of hair, stand well up on his feet. We quote his experience in breeding toward his ideal:

By selection, I tried to produce a hog with more size and at the same time a higher degree of quality than the average large type Poland China. I always felt that the most profitable hog for our market was the one that could be made to weigh 150 pounds on the least feed and do it the quickest. Many of the large type Polands were too narrow, too much bone for the amount of meat the bone was to carry, a generally coarse appearance that goes with expensive feeding, and a lack of the style and beauty that goes with what the judges speak of as quality.

At six months of age they would weigh much more than the medium types at the same age, but they were not choice meat. It makes no difference whether a breeder is raising for the pork market or the show ring, he has to produce something that will make good pork or producers of good pork hogs.

By selecting those of best conformation and prolificacy I have endeavored to get a hog with great size and a high degree of quality. I have sows in my herd running in the fields that have as good coats of hair, as broad backs, and as good conformation as I ever had while raising the medium types.

It is not so easy to raise a hog with an arched back when that hog is six feet long as it is when the hog

is four feet long. So it is necessary when raising for breeding purposes to select those of such good backs that you may expect the offspring to be good in this particular.

Too much daylight underneath the hog is objectionable, and the careful farmer will attend to this matter when selecting his breeding stock. The hams are the highest priced meats that are cured and so a ham that is broad and extending well down to the hock makes an animal more valuable than one faulty in this particular.

Now the fact that he raises good hogs would not entirely overcome the disadvantages of Mr. Henry's location if it were not for his advertising and his showing at the State Fairs, where he has been able to sustain a commanding position in the show ring for the past five years. But even there the winning of prizes is based primarily on the ability of the breeder and not on his location.

While one of the hardiest of trees, and most resistant to disease, the fig tree will sooner or later show the results of neglect. Lack of attention, cultivation, fertilization, and irrigation of fig trees in the San Joaquin valley has resulted in a decrease of vitality or loss of foliage in a great many of the fig orchards, and border or line trees. So says R. J. Hammond of the Hammond Packing Co.

How long since you have examined your roofs?

Are they in condition to withstand another winter's storms?

A leaky roof is a most annoying and a mighty expensive proposition.

You can avoid this annoyance and save the expense by covering your roofs with

Raising Poultry for Profit

SEASONABLE ITEMS FOR THE POULTRY YARD.

[Written for Pacific Rural Press by Susan Swaysgood, Pomona.]

Not all those who have good poultry were able to show at the State Fair, but almost anyone, with a little effort, can manage to enter something, or let the boys and girls try, at some nearby local show. There is nothing so encouraging to either young or old than to win a blue ribbon on something they have raised and cared for. The object of the poultry show is to educate the farmer and his family, and the people in general, into knowing what they should look for in birds of quality.

Look the flock over and if you think there are any specimens good enough to show, commence right away to put them in condition for some local show. Getting them in condition does not mean piling a lot of fat on them, but it does mean to put them where there are not a lot of others to eat all the feed you give them; and in case of male birds there should not be more than one in a place for fear they should fight and break feathers. It is immaterial, at this time of year, for the fowls to have all new perfect feathers because the molt is taken into consideration; but all feathers that are on the bird must be whole, from tip to stem, or the judge will not know but that the broken end had been off color.

After you have selected your specimens, look them over well for such defects as "side sprigs." These are abnormal growths on the original comb and very often grow on one or both sides of the comb, and are disqualifications. If you have smooth-legged varieties, look the

legs over well and be sure to put your glasses on to look for what are called "stubs." These are the appearance of feathers on the leg. In some breeds they revert back to the feather-legged ancestors; and on smooth-legged birds these stubs are disqualifying marks. Black feathers in white birds are also disqualifying as are white feathers in black birds. Wry tails, deformed breasts, twisted backs, five toes on four-toed varieties, and four toes where there should be five are disqualifying marks. The Houdan, Crevicouer, and Dorking are all five-toed varieties; all other breeds have four toes. A bird is in "condition," when the breast meat is level with the breast bone. If a fowl in this condition of flesh has good color, good carriage or shape, type, good head points and is clean, feathers glossy and legs clean and free from dirt underneath the scales, it stands a mighty good chance at a show. My telling you these things will not exactly make a fancier out of you, but if you have some good stock that you think comes near being a possible winner, it may start you on the road. The fancier has to be born, in a way, yet he can be educated to it if he is a lover of birds, and it is the cleanest and best sport in the world, if you don't get money mad over it.

Getting the Ducks in Laying Shape.—April hatched ducks should be about ready to lay now and if they are gotten in good shape will lay a lot of eggs, but in order to do so they must be fed right. Grain is not a proper feed for ducks, as they have no gizzard to grind grain, and need soft feed. I know that many people do feed grain, but it is always fed at a loss, for the duck does not masticate or grind it, consequently gets but little nourishment from it. I will give a good mash for laying ducks, but the ducks that are to be kept for breeding purposes should not be forced to lay yet; they are better left on range for another month or six weeks. Feed your layers a mash twice a day and if there is no green feed give sprouted oats at noon: one part bran, one part middlings, one part cornmeal, one part cut alfalfa, five per cent beef scrap, five per cent fine ground bone meal, and two per cent small grit and oyster shell. Mix all together with milk or water into a crumbly condition, not wet.

This mash may be fed in troughs or on boards. If the ducks get to laying heavy, increase the cornmeal and the beefscrap to help keep them in condition; but do not feed too heavily at first or they may get too fat. It requires good judgment to feed ducks just right and get the best out of them, but it can be done.

The poultry building on the Kings County Fair grounds has been torn down and a new one will be completed before the fair opens Oct. 2.

"Don't eat poultry the day it is killed" is the advice of Arizona College of Agriculture. Unless allowed to cool at least over night in a ventilated place, it will have a chickeny barnyard flavor, and the meat will be tough.

Poultry Breeders' Directory.

State Poultry Show.

The second annual show of the California State Poultry Breeders' Association will be held at Modesto, Dec. 6 to 9 inclusive. Entries close Nov. 28. C. G. Hinds, W. S. Russell and H. A. Currier will do the judging, which will be by score card. Entry fee will be \$1 for each bird and \$4 for each exhibition pen.

In the premium list issued, the following points for exhibitors are given:

Watch out for down or feathers on shanks of feet of all clean leg varieties and between toes.

See that your Langshans are well feathered on their outer toes beyond the first joint.

Do not show birds of single comb varieties with side-sprigs on their combs.

See that the rose-comb varieties have well defined "spike" at end of combs.

Do not exhibit black birds with white or gray in plumage. White will disqualify "black" birds and

black will disqualify "white" birds. Weigh the bantams and see that they are not overweight. Bantams are prized for their "smallness."

Be sure and read your American Standard of Perfection before entering each variety.

Do not send a sick fowl to the show. See that the birds are healthy.

Wash your white fowls about two days before you ship them to the show.

Clean up the legs of your fowls before shipping them. Use sweet oil and sulphur on the yellow-leg varieties and sweet oil without the sulphur on the black or white-leg varieties.

Soap and warm water will clean legs so that they will not be cut in the show room, if you take them in time. After washing apply oil and sulphur.

All birds will be weighed before judging. Be sure and have your bird up to standard weight.

Have leg bands on all of your birds. You save the secretary a lot of worry if you send your birds banded correctly.

WHAT 150 HENS EARNED.

[Written for Pacific Rural Press.]

When Chas. E. Edmondson of Tulare county began keeping books on his 150 hens October 1, 1915, it was with the intention of learning what they were costing him, and what they were paying him for his labor.

Alfalfa and other home supplied feeds were not taken account of because they would have been largely waste anyway, so the only charge for feed was \$98 that was paid for a load of corn.

For the 11 months ending August 1, his books showed the following receipts: Eggs sold to Tulare Co-Operative Poultry Association, \$279.91; 100 pullets raised at \$.50 each, \$50.00; poultry and eggs consumed at home, \$25. Total income \$354.91. Total net income \$256.91.

VALUE OF DUCKLINGS.

To the Editor: What is the value of white Indian Runner ducks about two months old, full feathered, from a very good egg-laying strain?—Mrs. R. D. K., Richfield.

[Answered by Geo. H. Croley.]

[Good quality purebred white Indian Runner ducklings two months old, intended for breeding, should be worth 50c to \$1 each in lots of not less than a dozen. Their value is greatly influenced by the feed and care they have received, as well as by the strain they are from. There is no way to tell how many are drakes until the curl feathers come.]

DAIRY WITH POULTRY.

While specialization with poultry has been one of the chief features of agricultural development in the Petaluma district of Sonoma county, dairying has played no small part in connection with poultry in the outlying sections where land values are not so high as to be prohibitive.

It is on such land in the Two Rock district that the ranch of Norman B. Hunter is located on which modern buildings have been erected and a purebred herd of Jerseys established.

Like most of the ranches in that district the Hunter ranch of 50 acres is quite hilly and for that reason cannot well be irrigated. But the soil is a fine black loam which retains moisture well and grows bounteous crops of grain hay and root crops; also fairly good crops of corn and vetch; and it is with this combination of crops that Mr. Hunter expects to be able to keep a moderate-sized herd of cows in connection with several hundred chickens.

As the nature and size of the ranch limits its carrying capacity the policy will be to maintain only the choicest of cows and it was with this intention that a number of purebred heifers were purchased last spring as well as a registered bull.

At the time of the writer's visit early in the summer, work was about completed on a modern dairy barn, and sanitary hog houses will be erected later, as hogs are to be a by-product of the dairy.

Pacific Rural Press PUBLICATIONS

CALIFORNIA FRUITS

AND HOW TO GROW THEM.

BY EDWARD J. WICKSON.

Contents by Chapter Titles:

The Climate and Its Local Modifications. Why Climate Specially Favors the Growth of Fruits. Fruit Soils. Wild Fruits. Mission Fruits. Introduction of Improved Fruit Varieties. Clearing Land for Fruit. Nursery Budding and Grafting. Preparation for Planting. Planting Trees and Vines. Pruning Orchard Trees and Thinning Fruit. Cultivation. Irrigating. Fertilizers for Fruit Trees and Vines. Apple. Apricot. Cherry. Peach. Nectarine. Pear. Plums and Prunes. Quince. Vine Propagating and Planting. Pruning and Care of the Vine. Grape Varieties. Date. Fig. Olive. Orange. Lemon, Lime, etc. Banana, Loquat, Persimmon, Pineapple. Avocado. Berries and Currants. Almond, Walnut, Chestnut, Peanut, etc. Fruit Canning, Crystallizing and Drying. Injurious Animals and Birds. Protection from Winds and Frosts. Utilization of Fruit Wastes.

Seventh Edition—Revised.

Price, \$3.00 per Copy. Postpaid.

California Vegetables in Garden and Field.

BY EDWARD J. WICKSON.

Contents by Chapter Titles:

Vegetable Growing. Farmers' Gardens. California Climate and Vegetable Growing. Garden Irrigation. Garden Drainage. Cultivation. Fertilization. Garden Location and Arrangement. Planting Season. Leek. Chives. Peas. Peppers. Potatoes. Radishes. Spinach. Squashes. Tomatoes. Turnip. Vegetable Sundries. Vegetable Canning and Drying. Seed-Growing. Garden Protection. Weeds.

Third Edition.

Revised Price, \$2.00 per Copy. Postpaid.

Second Thousand

Answered Questions in California Agriculture.

A Sequel to "One Thousand Questions in California Agriculture Answered."

BY EDWARD J. WICKSON, Editor Pacific Rural Press.

First Edition—1916.

256 pages, text only. Cloth bound.

This book is made up from a selected list of questions asked by farmers and answered in the columns of the Pacific Rural Press. Divided into nine parts, covering Fruit Growing; Vegetable Growing; Grain and Forage Crops; Soils, Fertilizers and Irrigation; Live Stock and Dairy; Feeding Animals; Diseases of Animals; Poultry Keeping; Pests and Diseases of Plants.

Price, \$1.50 per Copy, Postpaid.

CALIFORNIA GARDEN FLOWERS

SHRUBS, TREES AND VINES.

BEING MAINLY SUGGESTIONS FOR WORKING AMATEURS.

BY EDWARD J. WICKSON,

Hon. President California State Floral Society.

Contents by Chapter Titles:

Introductory. Climatic Characters and Advantages. Soils and Fertilizers. Tillage and Irrigation. Laying Out the Garden. Elements of Propagation. Growth of Plants from Seeds. Growth of Plants from Buds. Hot-Beds and Cold-Frames. The Amateur's Greenhouse. Planting, Pruning and Training. Characters, Adaptations and Requirements of the Months. Lawns and Ground-Covers. The Rose. The Carnation. The Chrysanthemum. Open-air Herbaceous Plants. Bulbs, Tubers and Roots. Flowers for Hot, Dry Regions. Water Plants in Gardens. Choice and Treatment of Arborescent Plants. Shrubs Approved. Garden Palms. Trees for Ornaments and Shade. Climbing Plants for Gardens. Methods Against Plant Pests and Diseases.

First Edition—1915.

Price, \$1.50 per Copy, Postpaid

CALIFORNIA POULTRY PRACTICE

A Practical Treatise on Poultry Raising in California.

BY MRS. SUSAN SWAYSGOOD.

160 pages of text, besides many full-page illustrations. Cloth bound.

In writing this book the author, after a life-time of active, practical and successful experience in poultry raising on the Pacific Coast, has endeavored to show the farmer how he can make the poultry department of his business more profitable. It deals with actual conditions—not theories—and covers every phase of the industry from eggs, chicks, disease and remedies to the profitable marketing of the products of the poultry farm.

Price, \$1 per Copy, Postpaid.

CALIFORNIA HOG BOOK

A Practical Treatise on Hog Raising in California.

BY W. S. GUILFORD.

Contents by Chapter Titles:

The Hog Industry. Hog Growing Conditions. Description of Hog. Judging and Selecting Hogs. Care of Boar. Care of Sow. Growing Pigs. Hog Feeds. Hog Feeding Suggestions. Hog Growing Systems. Hog Buildings. Hog Appliances. Handling Hogs. Hog in Health and Disease. Profit in Hog Raising. Markets and Marketing. Value of Pure-Bred Stock. Breeds. Hog Breeder. Hog Breeding. Exhibiting Hogs. Home-made Pork Products.

First Edition—1915.

Price, \$2.00 per Copy, Postpaid.

The KROGH Vertical Pumps

Are automatically water balanced and require no adjustment of any kind. All weights of shafting and rotating parts are carried on the water film absolutely without the use of thrust bearings or adjustment of any kind.

No BALANCE RINGS or PLATES in KROGH PUMPS. They are unnecessary, and mean only continual trouble. KROGH PUMPS with the least number of parts means less friction and greater efficiency.

Get our Bulletin No. 78 before deciding on a pump.

Krogh Manufacturing Co. SAN FRANCISCO. LOS ANGELES.

The Pacific Rural Press

(ESTABLISHED 1871.)

525 MARKET STREET,

SAN FRANCISCO

Mrs. Best's Letter.

My dear Friends:

I hope all of you who have daughters to dress for school will provide them with one of the pretty dark blue serges that are so popular just now. Most of them are made of a soft finish serge and are good style for street or church wear as well as school. The prevailing style is very loose, absolutely no waist line, except a loose belt or sash that is more of a trimming than anything else.

These dresses have pleated skirts and in some instances the pleats run up into a yoke almost like an old-fashioned Mother Hubbard. But the newest touch is the large pocket set on either side of the skirt and this is almost always beaded or embroidered in wool yarns.

One very attractive model had a pleated skirt with fancy pockets set onto an under waist and the waist itself was an Eton jacket, fastening across the shoulder and under the arm. The pockets were beaded in glass beads of two colors and the same design was worked out on the front of the waist.

The sleeves of all of them are long, reasonably loose at the top and pretty well fitted into the arm from the elbow down, ending in a little flare or point at the back. One of the very good stores is showing Peter Thompson dresses again, made exactly as the girls wore them nine or ten years ago, pleated skirts, sailor waists with large collars and emblems in colors, with the band of red around the sleeve. It seems like welcoming an old friend to see them again.

Most of these dresses are simple enough to be made at home and you can easily make one for half the price of the ready made ones. The popularity of the beading and embroidery gives the woman clever with her fingers an opportunity to develop her own designs or copy an expensive model.

If you have a suit, either silk or wool, that needs a little fixing up, try using fur on it. You can buy either narrow or wide strips by the yard, in moleskin, skunk, beaver, near seal and other furs and you will find that it goes a long way toward making a wool garment look new style and a silk garment look seasonable. A very good dressmaker told me she was putting fur on the taffeta suits she had made for her customers in the summer and they would wear them on into the winter. This fur ranges from \$1.50 a yard to as high as you wish to pay.

There is a new blouse on the market, made with a peplum or tunic to be worn on the outside of the skirt. These are made of crepe or chiffon, or light weight silk embroidered in gold or silver thread and are confined at the waist by a sash effect. They seem more suitable for wear with a separate skirt of silk than with a tailored suit. Nearly all the better blouses are open at the throat, only the strictly tailored waist having a high neck. Yours devotedly,

Rosabella Best.

For greasing bread pans, use a five-cent paint brush. Cut a hole in the cover of the can in which the grease is kept, in which to place the brush.

THE HOME CIRCLE

TO MAKE SAUERKRAUT.

Use one to three quarts salt to twenty gallons shredded slaw. Remove outside leaves and hard core of cabbage. Shred finely. Line the keg with the larger leaves on the bottom and sides as you fill it. Put in a three-inch layer of shredded cabbage and sprinkle with four or five tablespoonfuls salt. Continue to repeat this process, lining with the large leaves. Pound it all down well until the cask is full and covered with the brine. Cover with the large leaves and a board cover to fit inside the cask. Weight this cover down, as it is necessary that all the cabbage be covered with brine at all times. Keep in a cool dry place three weeks to a month. If the weather is warm, the kraut will cure in sixteen to eighteen days, when it is ready for use or canning.

DRY CLEANING AT HOME.

Crepe-de-chine blouses can be beautifully cleaned at home by washing in either gasoline or benzine. Use a large pan and enough fluid that you can rinse up and down freely. If the garment is much soiled, a rinsing in a pan of clean gasoline will improve it, but the results will be better if the garment is not allowed to become too dirty before cleaning.

But bear in mind that gasoline is very explosive, and never work with an open pan of it anywhere but in the open air. Even after the garment is dry, if it is still giving off gasoline odors, do not take it into a room with a fire or put into a closet. Serious fires are often started in households by the lighting of a match in a closet full of gasoline vapors. The odor of gasoline in any room is a danger signal.

TO CRISP LETTUCE.

Wash the lettuce well and shake—then pack closely into a pail that has a cover. When covered, put into a cool place and let stand several hours—it will be as crisp and fresh as though taken from the ice.

HOT SLAW.

Take one-third cup of vinegar, one egg, small lump of butter, pepper and salt. Heat and stir in finely chopped cabbage. Let stand for five minutes and serve hot.—L. C. W., Hanford.

CANNING WINDFALL APPLES.

All apple growers should be interested in the following new recipes for utilizing the windfalls and culls of an orchard. These deal with canning the apples whole, sliced for pie filling and quartered for fruit salads.

Apples for Pie Filling.—Wash, core and pare and slice into a basin of slightly salted water to keep from

discoloring. Pack into jars and add one cupful of thin sirup to each quart of fruit. Place in hot-water bath partially sealed for 12 minutes, then remove and finish sealing and invert. In using these apples for pies, pour off the sirup and proceed as with fresh apples, but being already cooked, the pie can be baked in less time.

For canning whole apples.—Wash and remove core and blanch in boiling hot water for two minutes. Plunge quickly into cold water. Pack in large empty glass jars and pour over a hot thin sirup. Place rubber and cap on and partially seal. For half-gallon jars, 20 minutes in boiling hot water is sufficient—these jars must rest on a perforated platform in the receptacle and the water must circulate freely around them and cover the top at least one inch. Count the time as soon as the water begins to "jump" over the surface. Remove and tighten covers and invert.

Quartered Apples for Fruit Salads.—Core, pare and quarter, pack in jars and proceed as in the sliced apples.

FASHION NOTES.

Beaded garnitures are much in evidence on dressy evening garments. The large ostrich feather fan in vivid colorings is shown in the good shops.

Circular collars in cape shape are seen of batiste, satin and beaded net.

Gold and silver embroidered laces are having a great vogue.

Wool challie in striking Oriental patterns is shown at one of the good stores.

Silk bags made of black and heavily beaded with steel beads show a lining of fancy flowered silk.

One of the new imported hatpins has the head the shape of a plum leaf, made of jet beads with a design in the center of colored beads.

Children's coats of bright colors have collar and cuffs bordered with narrow bands of fur.

HOUSEHOLD HINTS.

For softening brown sugar that has become lumpy, when kept any length of time, fill the tea kettle with boiling water and put the sugar in a pan, placing it over the teakettle to steam.

A square box that runs on casters makes a good stand for the washtub and can be easily moved from stove to sink, thus facilitating the filling of the tubs.

To wash brushes and combs, put a teaspoonful of ammonia in a basin of hot water and dip the brush up and down in it, letting the comb remain in the water for a few minutes. Rinse with clear water.

GERMAN APPLE CAKE.

One cup sour milk, 1 pint flour, 1 teaspoon soda, 1 egg, 2 table-spoons sugar, 1 teaspoon salt. Mix into soft dough and spread ½ inch thick in a large pan well greased. Pare and core 5 juicy apples, cut each into eight pieces, arrange on dough and sprinkle with sugar, cinnamon and nutmeg and bits of butter. Bake 25 minutes.

THERE'S ALWAYS SOMEONE WORSE OFF THAN YOU.

By M. P. Earl.

It isn't right to feel that way, It's very selfish, some folks say, Perhaps it's true; But on the whole, it's apt to pay To think there's someone, every day Worse off than you.

You get that feeling of despair, When something looks to you, less fair,

You know you do; You think there's no one, anywhere, With such a heavy load of care And toil as you.

And if you've little cash to spend, You think you haven't got a friend, When feeling "blue", But such a thought will quickly end You'll see it's foolish to pretend That such is true.

If you'll but let your thoughts all go To other people whom you know, There's quite a few, You'll find, in life, both high and low, Who have of sorrow, toil and woe, Much more than you.

It seems to make the sky more bright, And seems to make the load feel light,

Old things look new, So I believe it's only right To think, there's someone, day and night, Worse off than you.

WHEN GRANDMA RODE THE RUNNER.

Little grandma twisted restlessly. Not because she was cold. How could she be in quilted hood and homespun cloak, woollen mittens and stockings,—and buried, too, beneath wolfskins?

But she had sleighed all day, and was tired of sitting still. It was a long way to Great-aunt Ellen's.

"Mother," begged little grandma, "may I ride the runner?"

"Of course not," said great-grand-mamma promptly.

"I'll hold on tight."

"Don't mention it again," said great-grandmamma.

With a sigh, little grandma snuggled under the robes.

They were mounting Hardscrabble Hill, and Billy stopped to rest. Great-grandmamma laid the sleeping baby among the furs, and climbed to the front seat beside great-grand-papa.

Little grandma kept wanting to ride that runner. Next time Billy stopped for breath she slipped noiselessly from the sleigh and around to the back. She stood on the broad runner, and grasped the top of the sleigh with both mittens.

It was the end of the hill, and Billy started briskly. The runner struck a rut of a crossroad. Little grandma's feet bounced into the air, her hands were torn from their hold, and she was flung off into a drift. She lay half-stunned by the fall. After a while she picked herself up. The deep snowdrift was soft, and her heavy clothing saved her anything worse than the bump. The sleigh jingled out of hearing. Dazed from the fall, little grandma, instead of keeping straight ahead, turned down the cross-road. She listened for sleigh-bells, and heard a sound faint and musical. She hurried on, but it was only a boy drumming his milk-pail.

"Have you seen my sleigh drive by?" cried little grandma, hope-fully.

"Nobody's been by," answered the boy, staring, as well he might, at the little girl, alone, at the edge of the evening, on that dim road through the forest.

Little grandma sat flat down on the snow and cried. She knew she was lost.

"Mother!" shouted the boy, and ran to the house.

His mother came and let little grandma in. She sobbed out her story.

"There, there!" the boy's mother comforted. "We'll take you to your Aunt Ellen's. 'Tisn't far. I wish the horses were here so we could take you now, because your mother will worry."

"I can carry her," interrupted the boy, "with Star! If I go the short cut through the woods, we'll be there most as soon as her mother."

"It's nearly night, John," his mother hesitated, "and Star is so slow. It will be dark before you get home."

"I'm not afraid," said John, sturdily, and was off to the barn.

He came back in a tinkle of bells, driving Star.

"Why! It's a cow!" cried little grandma in astonishment. John laughed proudly.

"Trained her myself," he said as they tucked themselves into a mite of a sleigh.

"She's a year and a half old. Father gave her to me when she was a calf, and I broke her. Get up, Star!" He took the reins, and the heifer started obediently.

"She's slow, but safe. There's a wagon for summer. Star's broken to saddle, too."

"How old are you?" asked little grandma, respectfully.

"Nine," said John.

"Was she hard to teach?"

"It took quite a while. I never used whip or goad. Just coaxed her with apples and maple sugar."

Little grandma wasn't missed from the big sleigh. Her mother glanced back often to make sure the baby was all right, and, when she didn't see little grandma, supposed her cuddled under the robes to keep warm. At Great-aunt Ellen's everybody trooped out to greet them, so many that in the confusion one little girl more or less didn't count.

"Why didn't you bring one of the other children, too?" Great-aunt Ellen asked, hugging the baby.

"I did," answered great-grand-mamma, surprised. "Haven't you seen her?"

Then it was discovered that no-

body had seen her.

"She must be in the sleigh, asleep!"

Her father lighted a lantern, and went to the barn. He shook each robe. He searched under both seats. When he came in, he looked pale.

"She isn't there!" he cried.

Then every one was frightened.

"Could she have fallen out?"

Tinkling bells brought them to the door.

"Oh! She's there! She's found!"

cried little grandma's mother joyfully, the first to see her, and thanked John over and over for bringing her.

"I'll never, never ride a runner again!" promised remorseful little grandma, gratefully feeding Star a big lump of maple sugar.

John's pockets were filled with apples for himself, and then John and Star jingled merrily home down the dark woods road.—Alice Mary Farrington, in Sunday School Times.

Good Health.

[By H. E. Pastor, M. D.]

Value of Rural Health.

Senator Joseph E. Ransdell of Louisiana, in a recent address before the U. S. Senate, said the greatest asset which our country can have is the healthy American citizen. Valuable as it may be to increase the health of livestock and vegetation, it is of far greater importance that we throw every possible safeguard about the health of the man who is responsible for that livestock and vegetation, and for whom that livestock and vegetation are grown. Let not consideration for the means to an end outweigh the end itself.

How Infantile Paralysis is Spread.

Dr. Geo. H. Whipple, Professor of Research Medicine of the Univ. of Calif., speaking of infantile paralysis, says: "The infection may be spread by either moist or dry secretions from the nose and throat of those suffering from the disease. Flies may carry the virus to food or to people, but it is mainly human beings who spread the disease. The patients are ordinarily not infectious for more than four to six weeks, but some of the victims of the disease remain carriers after they are entirely cured." He advises disinfection of the clothing of all who have had the disease.

Polluted River Water.

A writer in the Monthly Bulletin of the Calif. State Board of Health says: "We wish some one would estimate the average cost of drinking the untreated water of the lower San Joaquin and Sacramento rivers. The cost would be high in shortening of life, loss of time through sickness, and loss of money through hospital and physicians' bills." A number of severe cases of typhoid, with some deaths, have been reported to the Board.

Meat-Eating and Appendicitis.

A writer in the International Journal of Surgery contends that the increased consumption of meat among the working classes is accountable for the greater frequency of appendicitis in England and the United States. The same observation has been made in Germany,

where rising wages have enabled the town classes to buy meat more freely. Acute cases of appendicitis are comparatively rare among Oriental peoples, who subsist largely on rice and other vegetable products. There can be little doubt that animal foods are more apt to set up digestive disturbances and putrefactive processes than vegetable foods, and these conditions predispose to appendicitis.

Vacations Not Time Wasted.

The advantages of an outdoor vacation are twofold, and not the least is the mental effect of a complete change of scene and occupation. There is nothing more depressing to the spirit than a changeless routine of duties and environment running into weeks, months, and even years. A person tied up to such a routine necessarily becomes inattentive, listless, stupid, and uninteresting, for there are no new objects to enlist the interest of the observing faculties. California is a State of infinite variety of landscape, climate, and industrial pursuits; no other State can measure up to it in this respect. If your abode is in the mountains, shut in as it is by high walls of eternal granite, visit some spot on the long line of California's seashore, with its illimitable vista of restless waters; if you live somewhere on the sweltering plains of the hot interior valleys, come to the coast and cool off. On the other hand, if you live in the coast region, hie to the interior, and give your overstrung nervous system the sedative effect of the soothing warmth and lulling quietude of the inland resorts. Pick out whatever you want, but want something in the nature of an annual outing, and get it. Vacations pay; they pay in reinvigorated health, and thus save doctor bills, and give you something new to think and talk about.

A large number of diphtheretic cases were reported last month as resulting from the use of unpasteurized milk.

THE WRONG WAY TO BUY A RANGE

Don't go to the store and pick a range. Get full information first on how a range must be built to stay a perfect baker, and to save fuel.

Write today for our Free Booklet which tells you how to judge the baking ability and fuel economy of a range.

Arcadian Malleable Charcoal Iron Range

Built like a locomotive boiler. No bolts to loosen. No stove putty to crumble. No possibility of false drafts to increase fuel bills and spoil baking qualities. The Arcadian never needs blacking. Write at once for Free Book.

THE MARKET REPORTS

Figures Given Are Independent and Reliable.
Prices Quoted as Paid to Producers.

San Francisco, Sept. 27, 1916.

Wheat.

There is lively demand for spot wheat of all varieties in the local market, and an upward tendency has been noted, but an easier feeling at Eastern speculative centers has prevented any quotable advance.

[f. o. b. San Francisco.]

Sonora wheat\$2.15@2.20
Northern club2.15@2.20
Calif. club, ctt.2.10@2.20
Northern Bluestem2.35@2.40
Northern Red2.20@2.40

Barley.

Prices are unchanged. The spot grain is in good demand, both locally and for shipment, and several foreign cargoes are going out.

[f. o. b. San Francisco.]

Shipping, ctt.\$1.75 @1.80
Choice feed, ctt.1.67½ @1.70

Oats.

Seed oats continue quite strong, with an active movement of most varieties. The local demand for feed is about normal at unchanged prices.

White1.75@1.80
Black seed3.00@3.25
Texas Red seed2.25@2.35

Corn.

Eastern yellow is moving at about the usual rate, the principal business being with milling interests. California yellow is out of the market. Some new Egyptian is arriving, causing a drop in the old-crop quotations; but the new grain is not yet well enough cured to be very attractive to dealers.

Eastern Yellow, ctt.\$2.10@2.15
Milo MaizeNominal
Egyptian, old crop,1.75@1.80

Beans.

Contradicting recent reports from the country local dealers state that there has seldom been a smaller proportion of the new crop under contract at this time of year than now. This applies to all varieties, but especially to whites. Owing to the cleanup of old small whites, buyers were anxious to buy for September delivery, and the small amount available was taken at \$7; and similar conditions have temporarily forced new large whites to \$6.50. This means an advance of at least 50c to the Eastern buyer, who cannot be persuaded to take much stock at such prices; and local dealers are holding off, being confident that prices will get down to normal as soon as new crop is harvested. The Michigan crop at present promises to be quite large, and the outlook is favorable for a large output of all kinds in California.

[On wharf, San Francisco.]

Oregon Vetch4½ @5 c
Mellilotus Indica7½ c
Mellilotus Alba20 c
Bur clover, reseeded10½ c
Canada Field Peas5½ c

Hay.

Supplies continue to come in slowly, and mainly by river route. Dealers say that there was considerable damage to hay remaining in the fields, of which there is said to be still a good deal at points depending on rail transportation. It is doubtful, however, if there has been enough damage to affect market appreciably. Most hay is believed to be under cover by this time, and such as remains in growers' hands is as a rule pretty steadily held, as the winter is sure to bring a large consuming demand through the country, as well as in city markets. Alfalfa is coming into this market more freely and ordinary lots are easier.

[Wholesale prices per ton, carload lots, San Francisco.]

Vegetables.

Little change is noted in prices, only a few items being marked down. Arrivals of all summer vegetables are large, much of the stock now appearing is of unattractive quality which tends to hold down values, though the demand is well up to the average. Celery is holding its own fairly well, as no excessive supplies are arriving yet. String beans are plentiful and lower. The canners are taking less interest in tomatoes, and the top price is 35c per lug, with excessive supplies. Summer squash is slow to clean up, cucumbers are very weak. Green corn continues to move off fairly well at the old prices.

Potatoes and Onions.

Onions have been practically all bought up by speculators, and some have been shipped East, while large quantities are being put in storage, the stock amounting to about 400 cars. Prices on the street are firm, though wharf prices as quoted are hardly up to last week. Sweet potatoes are still declining, and in ample supply. Delta potatoes are accumulating, and easier. Butter.

Notwithstanding heavy shipments of fresh butter to England, it is now reported that a large inquiry from

that market has been received for storage stock, and efforts are being made to fill it. As the export trade has already caused a shortage in storage supply this is causing a very firm feeling in the market and prices still tend upward. There is considerable demand for markets up and down the coast, and large arrivals are well cleaned up.

Deciduous Fruits.

The apple market is dull at present, with liberal offerings and speculators inclined to hold off, a great deal of stock is going into storage at packing houses and principal market points. Grapes are moving East rapidly and there is a good demand locally, though the offering of a good deal of unattractive stock has tended to retard the market. Pears are firmly held; peaches are doing very well, the crop in most districts being cleaned up. Figs are easy, as a lot of poor stock has arrived since the rain. Prunes are about gone, but plums still find a good sale. Huckleberries are less plentiful and higher; raspberries are about gone, while strawberries are holding their own, cranberries are coming into more prominence. Cantaloupes still find a very good market at old prices, casabas are in good demand, while watermelons are easy, with slow sales.

Special Deciduous Market Report.

[By J. L. Nagle.]

Sacramento, Sept. 26, 1916.

The rain of last Thursday did little or no apparent damage to the grape crop but somewhat affected the shipments for a few days in that growers did not think it advisable to pick and pack grapes from wet vines until the same had become thoroughly dried. The movement, however, has again started and though it is not as heavy as it was a week ago, shipments are fairly liberal.

Reports from the East indicate that Tokays and Malagas from some districts are arriving in the East showing heavy decay, which has had a tendency to somewhat affect the sale of good grapes. There is a very strong

demand for firm stock and indications are that this will continue throughout the season.

The following prices have ruled for the week:

New York.—Tokay grapes averaged \$1.50; Muscat, \$1.25; Cornichon, \$1.40; Malaga, \$1.19; Bartlett pears, \$3.00; Lemon Cling peaches, \$1.03; Levi, \$1.00.

Chicago.—Malaga grapes, \$1.15; Tokay, \$1.30; Salways, 66c.

Boston.—Tokay grapes, \$1.57; Malaga, \$1.25; Bartlett pears, \$2.75; Salway peaches, 70c.

Total shipments to Sept. 26, 12,697 cars; total shipments same date 1915, 10,794 cars.

Special Livestock Market Report.

San Francisco, Sept. 27, 1916.

Cattle.—There is no change in last week's quotations but the market is weak, having taken quite a decided slump during the week on account of the heavy receipts of Nevada cattle, said to be due to the bad season and the desire to market now, rather than hold through the winter. The purchase of several small bunches is reported in various parts of California indicating that smaller dealers are in the field, probably with the intention of cutting out the beefers for immediate slaughter and disposing of the feeders elsewhere.

Hogs.—Receipts continue about the same as they have for the past three weeks, stubble hogs being most in evidence and of a very satisfactory quality. Prices remain firm as quoted last week.

Sheep.—Sheep are rather scarce, Sacramento feed lots contributing heavily to the local supply at present. The market is firm at the old quotations.

North Portland, Ore., Sept. 25. Cattle.—Cattle sales were made on a good strong basis Monday. Receipts

were a little more liberal than last week. Feeder buyers were liberal bidders as well as killer buyers. Steers brought as high as \$7.00 with the bulk around \$6.75. Cows were in demand at \$5.00 to \$5.50 for the best. Bulls were as high as \$4.10. Receipts 1300.

Hogs.—Hog receipts were light, 1900 being yarded. The market was a brisk one and went to 10.05 with the bulk \$9.90 to \$10.00. The market closed strong.

Sheep.—Sheep receipts were lighter than usual with prices on a strong basis.

Wool.—There is very little buying reported in the country, growers having a decidedly different idea about values than the buyers. A few small lots have been picked up to fill small orders but nothing of a nature to change quotations. There is no change in the East or in London. There is some talk of lifting the embargo on pelts in Australia and the trade anticipates some such action with wool. The only local demand is for a limited amount of short staple and when this is bought up there is nothing favorable in sight.

Isabella65@75c

Dried Fruits.

The dried fruit market in general appears to be in healthy shape, with fairly active movement in nearly all lines, prices firm with some advances. Eastern buyers no longer look for lower prices and are coming into the market in a larger way. Apples, which have been quiet for some time, are now receiving more attention, causing a slight advance; the upward movement of apricots continues, with the crop about out of growers' hands, and strong demand. The Eastern trade has taken hold of peaches in good shape, shipments are now going forward rapidly. Prunes are much stronger in the East and a heavy buying movement is reported all over the country. There has been a large business in the country of late, and some sales are reported as high as 4c, though ordinary offerings would hardly bring that much at present.

Citrus Fruits.

The Eastern citrus auctions have eased up on prices of both Valencia oranges and lemons, the cause is stated to be the competition of deciduous fruits. However, prices are still good with prospects that they will remain so till the end of the season. At New York on Monday, Sept. 25, the auctions paid on averages from \$2.95 to \$5.80 per box for Valencias, and for lemons \$3.05 to \$5.45 per box.

Prospects for a bumper orange crop next season are very good at this time. Estimates place the crop now on the trees at fully 20 per cent over that of a year ago.

The lifting of the Australian embargo has resulted in placing many large orders for oranges here, and shippers are now having difficulty in getting steamer space. Local orange prices have been cut a little from last week's level, and lemons and lemonettes are lower, with more liberal offerings.

Horses.

The local market shows some signs of improvement, though by no means active. Most of the stock put on the market in the last fortnight has been disposed of, and quite a lot of unusually attractive stock has been brought in from the country, including a number of heavy drafters. Such horses have found a ready market at prices fully in line with the top figures quoted, and occasionally higher in the case of especially attractive animals. As a rule, however, the bidding was without much spirit, and it is not easy to find buyers for light and medium weight stock. The way things are going is shown by the appearance on the local market this week of 35 good stage horses from Calaveras county, whose place has been taken by motors.

Hops.

Prices have advanced sharply, and heavy purchases are reported in California. The Oregon crop is turning out of poor quality, and the advance is due to competition among buyers for choice stock.

Picking is now over in some sections, and the buyers are taking more interest in the new offerings, with slightly better prices offered. Sales in the Sonoma-Mendocino district are reported at an advance of 2c.

Publisher's Department.

Santa Barbara is the place, Oct. 26, 27 and 28, the time, and the meeting of California Association of Nurserymen the magnet which should pull a large attendance of horticulturists. A fine program is being arranged by Secretary Kruckeberg, which will be announced later.

Our former stock writer, Paul Parker, came up from Salinas the first of the week. He said that the farmers of Monterey county were very prosperous this season, and their prosperity was reflected in his paper, the Salinas Daily Journal. The increase of land holdings by the big sugar company in that county was deplored by Mr. Parker, as foreigners, mostly Hindus, were placed on land as fast as acquired by the company.

W. S. Ferris of Pomona writes us that the results obtained from the advertising carried in the Rural Press last season surpassed those obtained from any other of the several rural publications in which he carried advertising. "You can count on an ad whenever we have anything to sell."

Eighty per cent of my sales of pure-bred Durocs have been made through advertising in the Pacific Rural Press.—Hagen Smith, Woodland.

C. E. White of Forestville on renewing his subscription writes: "We deem it a privilege and a pleasure to send this check, as we have more than received our money's worth from the past issues that we have received of the Press."

BREEDS MARKETED.

To the Editor: What per cent of the different breeds of hogs come to the San Francisco market?—F. H., Berkeley.

[Answered by Western Meat Co.]

[About half of our receipts are of Poland China breeding, balance divided between Durocs, Berkshires and other breeds.]

FRUIT TREES—Long on apricot, almond and pear. Fine, thrifty stock. H. A. Hyde, Watsonville, Cal.

WANTED.

WANTED—Young men and women to attend the Western Normal Courses—Normal and Academic. The Normal Course gives an adequate preparation for teaching, at a great saving in time and money. Academic course gives practical finish to education. Write for Bulletin "A," Western Normal, 524 E. Market St., Stockton, Cal.

WANTED—Position on ranch or farm as electrical and mechanical engineer. 18 years' experience with electrical and mechanical work; gasoline engines, pumping plants, ice plants, storage batteries, etc. Correspondence solicited. Address Box 250, Pacific Rural Press.

HORTICULTURAL SUPERINTENDENT desires position as manager of private holdings. Salary or profit-sharing. Experienced in livestock. Box 270, this office.

A TECHNICALLY TRAINED AGRICULTURIST with experience on large orchards open for engagement after October 15th. Box 260, Pacific Rural Press.

YOUNG MAN thoroughly familiar with Holt Caterpillars, wants place Fall plowing with engine. Will stay as long as wanted. Shop and field experience. Total abstainer. C. S. Robinson, 137 No. San Joaquin St., Stockton.

POSITION WANTED—To take charge of a vineyard and orchard. Qualified by experience and agricultural college training. Straight salary; salary with dividends or share management acceptable. Reference furnished. Box 240, Rural Press.

COUNTRY LANDS.

DAIRY OR GARDEN TRUCK FARM—A-1. —80 acres 4 miles from S. P. station 50 miles from San Francisco. Well fenced 4 fields 3 acres fine stand alfalfa, family orchard, grape vines, large eucalyptus trees for shade and fuel; three wells, water piped to buildings and for irrigation; good improvements; 5 roomed house; large barn, milk house, granary, chicken and hog houses. Must be seen to appreciate its value. All for \$9,500, part cash. Apply or write Owner, 802 Claus Spreckels Building, San Francisco, Cal.

WANTED—Farms, large and small, in all parts of the State. Our system of placing owners in direct communication with buyers has brought us hundreds of applications for farms. What have you to offer? Write for our listing blanks. Western Farms Bureau, 660 Market St., San Francisco.

FOR TRADE—40 acres level alfalfa or almond land. Oakdale irrigated district on Stockton and Oakdale road. Some improvements, \$5500. Will take up to \$1500 in cows or other stock; balance 5 years, 6 per ct. Would sell 20. A. H. Pierce, Thalheim, Cal.

FOR SALE—23.32 acre irrigated ranch planted to alfalfa and almonds. Good improvements; close to good town; high school; creamery, etc. Price, \$275 per acre. Owner going East. Anton Medeck, Esparto, Cal.

INFORMATION free about State, Government land now open; different counties and States. Write your wants. Joseph Clark, 1611 K St., Sacramento.

WANTED—To buy interest in established poultry farm, located in one of the Bay counties. Box 280, Pacific Rural Press.

LAND FOR SALE near Livingston. 10 to 80-acre tracts. \$100 to \$125 per acre. Address, Box 31, Livingston, Cal.

WANTED—Second-hand 6- or 8-horse-pull orchard tractor. R. F. D., No. 19, Orland, Cal.

A 12,000 Horse Power Man

YOU ask, "What has this to do with me as a buyer of tires?" Just this: by such savings at the Firestone factory we cut down tire cost for you. One man feeds hundreds of tons of coal a day that develop 12,000 horsepower.

Firestone Tires

This is one of the many ways Firestone takes the cost out of overhead and puts the quality in the Tire. You profit through more quality—more mileage for less money.

It is equipment and efficiency of this kind throughout the Firestone factory and branches that give you exclusive quality, at ordinary price, in Firestone Tires.

Free Offer

A Firestone Cementless Tube Patch free, if you will send us your dealer's name, and the make of your tires.

Ask also for copy of our book, "Mileage Talks," No. 64.

Firestone Tire and Rubber Co.

"America's Largest Exclusive Tire and Rim Makers"

Akron, O.—Branches and Dealers Everywhere

CHUBBUCK'S IDEAL GOPHER TRAP
Larger than runway; jaws pull rodent in; catches large or small gopher and holds it. Farmers say it's worth dozen other makes. Big sales. Price 60c. If not at your dealer's will send it to you postpaid; 2 for 95c; 6 for \$2.70; 12 for \$5.10. Money back if you are not satisfied. Free circulars. E. J. Chubbuck Co. Dept. B San Francisco, Cal.

Practical Bookkeeping on a Dairy.

A farmer's system of knowing what his cows produce, what his weekly, monthly and yearly income is and from what source it has come.

[Written for Pacific Rural Press.]

J. HESSE is a dairyman in Merced county. He is also a business man, though not in the sense that we ordinarily think of business men; for instead of measuring muslin or weighing sugar he weighs milk and measures cows. Back in 1896, Mr. Hesse began to keep dairy cows. They were only scrubs, but that didn't interfere with his starting a set of books in which were set down such data as he thought might be of some future use to him.

As a usual thing your business man has a complicated set of books made up of heavily bound journals, ledgers, etc., but not so with Mr. Hesse. His investment in books hasn't exceeded perhaps two dollars in the last 20 years, and yet those little cheap, paper-covered books contain records of practical experience that is seldom equaled in the most modern business house; and it is this that makes his records doubly interesting to the practical dairyman.

Those first year's books were more in the form of a diary of every cow he kept than anything else. Each cow's name was entered and below you find date bred, when she freshened, when she was dried up, the sex of her calf, weight of calf at birth and weight of bull calves when sold.

Early Benefits.—Mr. Hesse knows a number of things that your average dairyman has to guess at. He knows that the average length of time a cow carries her calf is 281 days, that the shortest time a cow in his herd has ever carried her calf was 252 days and that the longest period was 305 days. This saves him a lot of unnecessary worrying, for he knows what to expect with most of his cows. Some are of the opinion that they can regulate the percentage of heifer calves.

Mr. Hesse has tried out various of these schemes but his records tell him they were all in vain, for out of 165 calves 87 were bulls and 77 heifers and these were spread over a period of a great many years.

In weight of bull calves, it takes a pretty shrewd butcher to outguess Mr. Hesse, for he has weighed his calves so long that he knows pretty close what the weight at birth and the gain per week should be.

Breeding Record.—In later years he has improved his system of record keeping. Now he has his breeding records on a sheet of ruled paper that is enclosed in a glass frame near the separator so that it is in plain view every milking. On this sheet is found the name of cow, the month she was bred, the date she is due and the date she is dried up. If for any reason a cow is not bred when she comes in heat, a star is placed opposite her name, under the proper date. Thus it is known

when she will come in heat again.

Milk Records.—In 1905 Mr. Hesse started to elaborate on his record keeping system by the purchase of scales and a Babcock tester. Now he started two new account sheets; one for the individual cows and one for the herd, the latter also taking into account practically every business transaction in connection with the dairy.

The weighing and testing of milk of individual cows has been done ever since then. At times it has been every day, sometimes every ten days, but latterly every month, two milkings being weighed and tested once a month and multiplied by the days in the month in order to figure the production of milk and fat per cow each year. For all practical purposes the once-a-month testing has been found satisfactory and will be

continued. Naturally it has been this regular testing of each cow in the herd that has led to a higher average production each year. Last year the herd average was 286 pounds for a ten and a half month lactation period; but this will be increased in the present year because the poorer cows have been weeded out. And it has been this regular testing more than anything else that has led to the use of purebred Holstein bulls for a number of years.

But while the individual records of his cows are one of the main factors in his success, it is in his simple system of keeping herd records, creamery returns, etc., that his methods are most unusual.

Here he has a check on everything about the business. He takes samples and weights of his whole milk, cream and skim milk. By testing these he knows approximately what his milk tests are, what his cream tests are and how much fat he is running through the separator into hog feed. These and other interesting facts are recorded on ruled sheets, shown at the close of this article.

No Guessing.—It will be seen that one set of the data is secured by testing and weighing the milk and cream on the ranch and that the other is the data furnished by the creamery in their statements.

In this manner Mr. Hesse has three separate and distinct sets of figures on the total amount of butterfat sold. First he has the weight and test of the milk separated. By weighing and testing his cream he is able to verify the correctness of his milk testing, and if both of these agree they should correspond with the creamery's statement.

By subtracting the amount of milk produced from the amount separated he is able to tell exactly the amount of milk for his calves. By recording the amount of skim milk, he is also able to tell what his hogs are consuming per head and by keeping track of other feeds and weights of gain he could easily determine what his skim milk is worth per hundred.

THE WEEK.

ASIDE from farm-cropping, which is the greatest weather-risk the world over, the largest single wager ever laid against the weather, so far as we know, was the insurance of \$25,000 issued by Lloyds last week that the sky would smile over an open-air operatic performance in San Francisco on the evening of September 30. As a matter of fact the sky did not smile: it frowned and also wept copiously. But Lloyds did the smiling, paid their loss, and undertook the performance themselves on a later evening to recover what they could from their bad bet on the weather. Our interest in the incident lies in possible agricultural bearings of it. Lloyds' insurance on San Francisco weather at this date was a rational venture. It is the season for the real autumn rain to begin, but such rains come from storms which normally strike the coast a thousand miles or more north of us, and either pass eastward without wetting us or else occupy some days rolling down our way. Therefore, it was rational, several days in advance, to insure a clear sky on the night in question—if no drive on the northern coast had disclosed itself. As we understand it, this was what the Lloyds did. And this is what happened. A storm was moving toward the coast of British Columbia, across an ocean area where there are no weather-observers watchfully waiting, at the very time when Lloyds were laying their wager. In its eastward drive this storm met impregnable aerial barriers, and was repulsed with great loss before it could land its blow and be reported. It bounced back from this aerial opposition and made a surprise attack on the coast of California, washed away Lloyds' margin, and poured down water along our coast—even to the measure of an inch and a half at some southern points—staining a lot of beans and playing other expensive pranks with farmers' property.

AGRICULTURAL SIGNIFICANCE OF IT.

THE point which we would make as the lesson of this experience is that insurance against farmers' losses by bad weather is a rational undertaking and should be developed in the interest of individual comfort and general prosperity. We are not sure that we would advise that it be done in Lloyds' way. They are bold operators and willing to take all the chances of not losing. We presume they would insure against undue heat in the future life of a decedent man on the ground that defective communication would prevent the beneficiary from submitting satisfactory proofs and collecting damages for climatic changes in his environment. And yet, crop loss by bad weather is as rational to insure against as crop loss by fire, and can be met by the same science of calculation and preparedness. And it is not only theoretically rational, but it has been demonstrated to be practically feasible and beneficent. Insurance against crop-losses by hail has long been common in Europe, all the way from Italy to the Baltic. It began with risks taken with great profit by private insurance companies, and is now very cheaply and successfully undertaken by farmers' co-operative societies. The same course of beginning and devel-

opment into self-protection by farmers, has taken place in insurance against live stock losses, of all possible kinds, in European countries. There is no reason why it should not be provided to cover all kinds of agricultural risks which can be measured and to protect against all destructive agencies which can be defined and causatively understood. There is no reason why a lone man should longer stand uncovered under a threatening sky and submit himself and his family to crushing deprivation and defeat. A little contribution from the super-abundance of each will insure the comfort of all. Farmers should begin at once discussion of preparation for all kinds of crop losses. They should also insist that the government liberally provide for extension and ampler equipment of the Weather Bureau so that all approach of dangerous weather phenomena shall be foreknown.

KEEP WATER WHERE IT BELONGS.

THINKING of Lloyds' loss reminds us that chance of getting water into the wrong place is possible in other ways than by rainfall. This writer feels free to speak of it because he does not make a practice of drinking water in San Francisco and because he owns no thirsty land in the San Joaquin valley. For these reasons he may claim to be reasonably free from personal prejudice or interest in the issue which has arisen between the metropolis and the valley as to which shall have snow water from the Tuolumne river. We therefore feel perfectly free to declare that in our opinion the effort to take water from the valley to serve the city is as unjust as it is unnecessary and unwise. There is water enough in the coast water-sheds, if properly handled, to serve the growth of the city for a considerable period of time, and investment to develop and husband such supplies will remain well made, no matter what later generations may think wise to do. And beyond these nearer supplies, which should be permanently secured, there are almost incalculable amounts of water in more remote districts, which would be well rid of it, to insure the city enough water for its greatest possible development in all coming time. We believe these statements rest upon the expert knowledge of engineers whose capability is unquestioned. This being the case, why should the metropolis pursue its undertaking to take water away from the San Joaquin valley, whose future development will require every drop its eastern mountains can supply? It looks to us like a great instance of miscalculation and misunderstanding of the real relation which should be recognized between the futures of the city and the valley. The valley claims, and we presume unimpeachably, that it owns the water under the law, and that it is now using it for a desirable purpose in production: that it is unlawful to take water from one watershed for use in another, so long, at least, as the land to which the water naturally belongs has capacity for the full use of it; that the growth of the valley demands all such water and that to remove any part of it will mean arrested development. Whether such claims, which seem to us true and just, will perpetually prevent the taking of the valley's water or not, we do not know. There is, however, one principle beyond all these which should determine the city's policy, and that is that to take water from valley producers is to set limits on its own growth and prosperity. The city cannot enforce idleness on any valley land without checking its own activity. Rather than rob its tributary country of its chief producing agency it should loyally declare to the valley that it will henceforth cheerfully drink—whatever the next election makes available.

FARMERS TO SAVE MONEY, NOT USE IT.

APROMINENT San Francisco banker, at the meeting last month of the American Bankers' Association in Kansas City, is reported to have said this:

While the end sought by the rural credit act of Congress was sociological, an endeavor to stem the drift of population to the cities, lower rates of interest and greater facilities for getting into debt would not of themselves serve to accomplish this result. The men who have the most intimate experience with farm conditions generally believe that borrowing is already too easy for the farmer.

The San Franciscan, credited with using these

words, is a high-minded, sincere man, who really believes what he says, as do other men of similar training and experience, because he does not understand the character of modern farming and its relation to world support and progress. In the first place his judgment is inaccurate because he still occupies the old point of view of financial men, viz.: that it is the function of the farmer to clear and subdue wild land which is virtually given to him by the Creator, through His terrestrial agent, the government; to feed himself and his family with what he can not sell; to sell all that he can and to take the money to the banker to invest for him, and to get fore-handed by the process of hard working and close-saving. It was a pretty sure way to get rich, as riches were measured in those days, and for a farmer to borrow money was an indication that something was the matter with him or his farming. It was the function of the farmer to create and store up money which the banker could lend to other people to use in their business. The American farmer discharged this function nobly for a good many decades, and the banker helped the farmer to get as much interest as he could on his savings—charging the farmer about as much for the handling as he gave him for creating the value. During the last few decades conditions have been changing so that new farmers could not start with a practical gift of the land as the old farmers did, and a farm beginning called for considerable investment; farmers became borrowers, and all the chances of loss multiplied under the new situation in which farming found itself. It became more or less true that "borrowing became too easy for the farmer," but it was because paying back became practically impossible, for bonuses and rates were too high and terms so short that compounding was facilitated. In fact it was so sharp a change in condition that new farmers were fleeced with the same tools that old farmers helped with in the shearing, and there has now come what our San Francisco banker calls a "sociological end," but he mistakes the purpose. It is not primarily to "stem the drift of population to the cities." That is only measurably incidental, and not such an unmixed blessing to be sought as our amateur sociologists claim. The farmer does not care how many people go to the cities, if they behave themselves and do things which the public needs. From one point of view the more people who get bravely busy in the cities, the better for him. He has to feed them all, and city-building and activities help him to get his fair share of the wealth which all well-employed mankind is busy in creating. But to do this it is also necessary for him to be able to stay on the farm and not be dislodged from it by the exactions of money-changers. This is the "sociological end" at which the new rural credit legislation aims, because, under the new conditions, farmers must use money in order to save money, and it is really the duty of city bankers, who are this month doing more politics than finance, to recover as fast as possible from this dissipation, say less about "borrowing being too easy for farmers," and do more to make it easier still, for all who possess farming and business qualifications to use money in the progressive production of the present day. It may not be necessary for the recent "farm loan act" to lend a dollar. The custodians of the immense accumulations of city banks, which are now straining the rivets of their vaults, can regulate that matter, if they have wisdom and breadth of vision, but they can never do it by voicing antiquated notions that "borrowing is already too easy for the farmer."

LUBIN GOES TO MARKET.

THAT grand old patriot and far-seeing economic philosopher, David Lubin of Sacramento, is devoting the "heated term" in Europe to the extension of demonstrations of his plan of direct trade between consumers and producers of food supplies. As mentioned some weeks ago in these columns, his experiment at Sacramento, by the co-operation of the California State Grange, yielded very encouraging results, and now he has secured opportunity for another demonstration under the executive and congressional noses in Washington. It is another demonstration, not only of direct trade, but of Lubin's genius for put-

ting a demonstration where it will do most good, because the pursuit of his ideal will require some adaptation of postal regulations which are exceedingly hard to get unless you are on the spot with the proper kind of a can-opener. One of the acts passed at the last session of Congress and signed by President Wilson, authorizes an appropriation of \$10,000 for an experiment in food trading in the city of Washington. The essential feature of the plan is the adoption by the postal authorities of the system employed by mail order houses in delivering and collecting parcels through the post-office, and in receiving and paying the purchase price therefor. Mr. Lubin has delivered addresses in Eastern cities pointing out the advantages of his system, the benefits derived from dividing the

profits of the middlemen between the consumer, who pays less for his food supplies, and the farmer, who receives more for his produce. The parcel post system Mr. Lubin has devised, and which is soon to go into effect temporarily at least in the national capital, is an improvement of a postal distribution system which is already working successfully in Europe. The parcels post and rural delivery have put the farm on the map. They have already made the express companies reasonable, enterprising and busy beyond old records, instead of killing them, as was supposed it might do. Mr. Lubin's plan promises to be of great benefit to food producers and consumers, but it is not safe to claim that it will not also help everybody by promoting better and more reasonable business.

stand in the mud. The black walnut root will stand either more or less water than the English walnut seedling without root injury. You do not need to keep the alfalfa so far away from the trees. You might get the equivalent of five tons of hay to the acre from the land actually occupied by the alfalfa. The amount of water at each irrigation depends upon depth and character of the soil. Do not use enough to keep it standing long on the surface. If you can only use a little at a time, irrigate oftener. You can grow alfalfa by overhead spraying if you wish to pay the cost of the outfit. A few are doing it on small areas. Almond trees are more sensitive to standing water than walnuts. Therefore with adobe soil you must be careful to let them drink little and often.

QUERIES AND REPLIES

Inquirers Must
Give Full Name
and Address.

Soil Depth and Soil Blasting.

To the Editor: I am leveling ground to plant orange trees next spring and wish to know how deep the root system of orange and lemon tree penetrates. Also how deep is it advisable to place dynamite for breaking up all hardpan? I mean at what depth will hardpan cease to be a menace to the tree? What is the best kind and "percent" of powder to use?—Planter, Fresno county.

The orange tree will bear well and look happy for a good many years providing a shallow soil is furnished with fertilizers and water in such a way that the soil does not become too poor or too sour, or too muddy below. If the soil is kept right in these respects the trees might be satisfactory for a long time on something like three feet of soil. But though this is true and though most of our orange trees are rather shallow-rooted, the tree will go much deeper if the soil is hospitable and be the better and longer lived in thrift and vigor if it can send some of its roots twice or thrice as deep in an open, well-aerated soil. Under most conditions of tight, hard subsoil, this is promoted by blasting. How deep the soil is rendered available by blasting depends not alone on the shattering, but upon whether excess water will move out to the depth to which the disturbance reaches. If you can still bog the soil by irrigation, a shattered bottom may be no better than a solid bottom, and it may be worse. It depends then upon the character of the subsoil substance and its relation to gravity-escape of excess water, whether you make greater depth of soil available for root-penetration or not. Of course if you master the wise trick of regulating your irrigation so that moisture and air go evenly and not in excess to the depth of your shattering, then, theoretically, the whole of the new depth becomes hospitable and invites deeper rooting of the tree. The use of powder in soil treatment does not make the operation of farming less intelligent. Like most improved methods and agencies, it calls for greater wisdom.

As for the practical operation of soil blasting, including methods and materials, correspondence should be undertaken with those advertising powders for farm uses in our columns. They expect to stay in the business and to increase it and it is to their interest that blasting should be well done and with the fullest knowledge of what it may be expected to do, in its effects upon the soil and the crops grown upon it.

Slitting Bark of Fruit Trees.

To the Editor: Will it do any harm to slit the bark on cherry trees (about two years old) at this time of the year, or would it be better to wait until spring? I have quite a number of these young trees which seem to be dying, and I find considerable gum on them.—A. W. B., Sebastopol.

We know very little about the advantage of slitting the bark of fruit trees for any purpose or at any time of the year. We have seen cases in which the trees seemed healthy enough but bark-bound by hardening of the bark, or other cause, which seemed to prevent normal enlargement, and enlargement after slitting seemed to warrant the operation. We see no reason for slitting bark when gumming shows that the root system of the tree is not able to furnish a sufficiently vigorous sap flow. There may be cases in which gumming

indicates too much sap, but it generally means there is too little, and it is too little sap which makes trees sick. In that case it is desirable and reasonable to cut trees back and give the roots less top to keep alive but not to slit the bark to cause more loss of force. If we slit at all it would be in the summer, while there is still activity in the tree, and not in the dormant season. We apprehend that if your trees have recently shown gumming and other signs of death, it indicates that they have had too little moisture during the latter part of the summer. If they showed such signs in the spring it was caused by too much water in the soil during last winter. Cherry trees are quite apt to act both ways and we cannot see that bark slitting is a reasonable punishment for either behavior. We would cut back, in the hope that the tree might thus be helped to carry its load, but we should expect to lose a young cherry tree which took to gumming at this time of the year, when it will have no chance to restore condition by growth processes.

We have conceded that there might be wisdom in bark slitting under certain conditions. We are not sure of it. We are rather inclined to the view that bark-slitting of fruit trees belongs to that degree of enlightenment which prescribes slitting the tails of cows to cure the "hollow-horn."

Vines for a Tank-house.

To the Editor: What is the best vine to plant for covering a tankhouse 30 ft. high to keep it cool in summer and warm in winter, and at the same time beautify the structure? Would you suggest English ivy, which I understand is an evergreen, or Boston ivy, or what? Also, what is the best time to plant, and how?—W. C. I., Stockton.

English ivy has done a good deal of high climbing in the San Joaquin valley and it makes a dense evergreen screen against heat and cold as you suggest. It does not, however, strike us as very beautiful. It is of somber hue and will make a very straggling growth, hanging in masses unless you do a good deal of high pruning. Boston ivy climbs well and does well in the valley. It clings closely and keeps the shape of the structure, and has a brighter aspect both in its verdure and its autumn coloring. But it is deciduous and would leave the structure with only a tracery of bare vines in the winter. Virginia creeper, trumpet vine (*Bignonia radicans*) and many others are worth consideration. If you look over the older houses in your city you may get sight of something which will please you greatly. The best way to start is to buy plants at the nurseries which you can plant out any time that suits you.

Alfalfa and Nut Trees.

To the Editor: Will it retard the growth or injure young walnut trees on adobe land to grow alfalfa between the trees, if it is kept 8 or 10 feet away from the trees? What will average alfalfa produce per acre? What amount of water should alfalfa have at each irrigation? Is an overhead spray system successful for alfalfa? Would growing alfalfa under the above conditions harm young almond trees?—B. W., San Francisco.

Alfalfa will not injure walnuts if you use water enough to keep it from robbing the trees of moisture and do not use so much that the trees have to

A Question of Peach Spurs.

To the Editor: Why do fruit spurs in the center of peach trees die back? People in this valley say that if you thin or not they will die back in the center anyhow up to the age of 6 years old; after that they will not die back.—W. H. D., Hemet.

It is not the habit of the peach tree to bear on spurs as most other deciduous fruits do. It always bears on the new wood, that is the wood which grew the preceding summer. The thin twigs which break from the old bark are weak and often die without doing anything but make a few leaves. If they do bear they often have not strength enough to make new wood beyond and die as you describe. They do not make new bloom buds on a spur, and if they do not make a new shoot beyond, that is the end of them. A young tree is more apt to do this, as your neighbors say, because a young tree is growing so fast farther out on the branches. If you wish bearing wood below, cut off some of the branches to force out stronger shoots lower down.

Asparagus Growing.

To the Editor: I would like to know how to start and care for a small asparagus bed from start to finish. Can the roots be set out soon after the first rain? Which would be best, six-year-old roots or two-year-old roots? I have both.—B., Carpinteria.

Details of California asparagus growing are given in our book "California Vegetables in Garden and Field." You should proceed at once to prepare the ground, digging out the space a foot or more in depth and putting a layer of several inches of well rotted manure and then several inches of well pulverized surface soil. When this has been settled by the rains, rake again the soil and set the roots so they will be six inches or more below the old surface and fill in with good soil and cover with coarse manure so that heavy rains shall not pack the surface too hard. In California one-year-old roots are best and two-year-old roots will do well. Older roots are not desirable. Do not cut any shoots the first year and only a few the second year. After that the bed will stand hard cutting if the surface is manured every year.

Better Start with a Good Tree.

To the Editor: I lost a great many three and four year old trees by sour sap. The root is myrobalan and they are throwing out nice suckers now. Is it better to pull them out or to graft the suckers? And would the latter make a good tree?—G. A., Healdsburg.

You must have had "sour sap in the top"—whatever that is. The myrobalan roots seem to be sound but though you might get a good growth by grafting a strong sucker, we prefer to start with a good tree. If you should put grafts in two or three suckers from a stump you would always be ashamed of the trees you get that way. Besides it costs a lot of time to get growth by grafting suckers.

How to Get a Farm Center Hall.

[Written for Pacific Rural Press.]

Some speed in getting big things done is the record of the Mt. George Center of the Napa County Farm Bureau. On January 29, 1916, it was first proposed to erect a Farm Center Hall of their own. On Sept. 3, the fine bungalow shown in the illustration, 40x48 feet besides pergola and stage, and costing for lumber, brick, cement, etc., \$1,120.10, was dedicated with elaborate ceremonies, including the flag raising.

On the evening it was proposed

other, and hauled free by three others. All work except a little requiring special skill was donated.

On Feb. 13, ground was broken, 15 days after the project was first proposed. On Feb. 15, the contract for lumber was awarded to a local firm, two members guaranteeing payment. The flag, flag-pole, and sign, besides \$50 cash, were donated by persons outside the center who believe in helping those who help themselves. Trees to decorate the

Farm Center Hall, Dedicated Seven Months After It Was First Proposed.

(Jan. 29) a committee of eight was appointed to see what could be done. They secured an option on one-third acre on the Hagan road near Napa; and at a special meeting of the Farm Center Feb. 5, it was decided to pay the \$40 asked for it. A tentative Board of Trustees was appointed. Legal papers were made out gratis by an attorney member of the center. Another member drew plans for the Hall and superintended the building of it, gratis. Gravel was furnished free by an-

grounds were furnished by a local nurseryman.

The basement is 40x48 feet, the stage 12x28, and the pergola in front which will protect visitors alighting from vehicles in rainy weather, is 12½x42 feet.

Ladies of the Center served meals to the men working on the building and grounds. They will also have a large part in paying for it by means of entertainments, dinners, etc., which will themselves lead to still more of this progressive co-operation.

Alfalfa for Hogs and Hay.

[Written for Pacific Rural Press.]

The possibilities of growing alfalfa and hogs on the rolling hill lands in the Watsonville district of Santa Cruz county, provided abundance of water for pumping can be secured, seems to be pretty well demonstrated on the ranch of E. A. Hall.

Six years ago Mr. Hall purchased 32 acres of apple orchard, adjacent to a natural lake. By putting in a 10-horsepower electric motor and a three and a half inch pump he was able to lift sufficient water for irrigation purposes onto the highest part of his land with 53 foot lift.

Pipes and flumes were constructed along the crest of the ridge and alfalfa seeded broadcast among the apple trees. The purpose of this system has been two-fold, first, to provide feed for the herd of pure-bred Poland China hogs he has established, and secondly to supply nitrogen, and moisture to the trees.

Although he didn't properly level his land, which he will do next winter, the alfalfa has produced sufficient feed to carry as many as 125 hogs at a time and always before this year he has cut 25 to 30 tons for hay.

At harvesting time the hogs have to be penned up because of their

apple-picking stunts but after harvest they do a thorough and profitable job of cull cleaning the orchard.

Besides the additional profit he secures from the hogs Mr. Hall is of the opinion that he gets a larger crop of more highly colored and larger apples than he would without the additional moisture and especially is this true, he says, with the Bellflower, which is ordinarily a shy bearer on hill lands, but which bears regularly and heavily with him.

THE OLDEST CORK OAKS IN CALIFORNIA.

[Written for Pacific Rural Press by Dr. W. L. Jepson.]

In the course of botanical wanderings in the Sierra foothills a noon-stop was made at the old hostelry in Jamestown, the "Jimtown" of gold days, but now a railway center where one waits long for the train that moves up and down and sidewise on the various branches. So whilst waiting the curious traveler inspects the interesting display of Tuolumne agricultural products and Black Bart relics in the purviews of the ample hotel bar-room. Amongst them all my eye was caught by fine specimens of the

bark of the cork oak, labeled as being cut from trees planted in the neighborhood in 1858,—the days when seed distribution by the embryo United States Department of Agriculture was part of the work of the Patent Office.

So we went to see the trees, driving through a country, half farming, half mining, which was very beautiful to the eye, and so came to Tuttletown where Bret Harte clerked in the store. There are three large trees standing in a row in the canyon bottom just below the village. They have the best of soil and moisture conditions and are fine healthy trees. For present interest and future need I here record measurements:

	Trunk circumference	Height at six ft.
West Tree.	.72 ft. 26 ft. 60 in.	
Middle Tree	78 ft. 30 ft. 62 in.	
East Tree.	.52 ft. 18 ft. 58 in.	

The bark on the trunk averages, as shown by the axe-injured bark of one tree, 1¼ to 2½ inches thick. It is apparently of good quality, and would seem to give further demon-

stration, if such were necessary, that as a forestal proposition at least, the production of commercial grades of cork is possible in California.

The writer does not really know that these trees are the oldest of their kind in California. The heading of this note is merely a challenge to Pacific Rural Press readers.

Dept. of Botany, University of California.

[We are glad to have these measurements by Dr. Jepson. Although there have been reported sturdy oaks from that Patent Office distribution of acorns at various points in California, we have no reports of any as large as these. We remember reports of trees in Sonoma, Calaveras, Tulare and Los Angeles counties and they are to be found, no doubt, elsewhere. We shall be glad to have information of other trees.—Eds.]

It is reported that the San Joaquin Valley Sugar Company will pay the freight on all beets received from all parts of the valley to its mill on an equality.

Mogul 8-16—A Real Kerosene Tractor

Sells for \$725 Cash f. o. b. Chicago

WHEN you buy a tractor, look beyond the price. It is not the price a man pays for a tractor which is of the most importance, but what its power costs. A Mogul 8-16 burning kerosene, in 5,000 hours of work, will save more than its original price over the cost of the same power produced by a gasoline tractor. Remember, the 8-16 is a real kerosene tractor, planned and built originally for using this cheap, plentiful fuel. Price is of minor importance compared with Mogul 8-16 saving.

It is our policy to sell the Mogul 8-16 at the lowest possible price, always maintaining Mogul quality, though nowadays some of the materials are almost unobtainable even at an advance in price of from 50 to 100 per cent over the prices of a few months ago. \$725 cash f. o. b. Chicago is the lowest price at which Mogul 8-16 can be sold.

Orders placed at once will stand the best chance of being filled without delay. See the Mogul 8-16 dealer or write us for the story of kerosene before you buy any tractor.

Co-operative vs. Individual Marketing.

[Written for Pacific Rural Press.]

On Sept. 29 Frank Swett of Alhambra Valley shipped a carload of dried French prunes to San Jose. The carload contained 20 tons of prunes and brought \$2850, being probably one of the highest-priced cars of prunes ever leaving Contra Costa county. The prunes were grown on seven acres, making the gross returns about \$400 an acre, from which, of course, expenses of pruning, plowing and spraying must be deducted. The harvesting of the crop was done by the small boys of Martinez during their vacation, who picked the prunes from the ground one by one. They received \$5 a fresh ton, and earned up to \$2.50 a day.

Mr. Swett attributed the good price received, almost 7 cents a pound (a "basis" price of 5½ cents) to information received through the Prune and Apricot Bureau of Information, whose offices are at San Jose.

Prune growers should make use of this growers' organization, which charges only 20 cents a ton on the product handled. A few only of the Contra Costa growers sold through the Bureau this season. The grower seldom knows what is going on elsewhere in the State, until after things happen and such knowledge is useless for marketing purposes. It is good for the speculator, who expatiates to the farmer on the "big crops elsewhere," pokes forward a fountain pen, and gets a sign-up.

Most of the prunes of the county, instead of bringing a 5½ cent basis, brought from 4 to 4¼ cents. In many cases the buyers made more money in ten minutes' talk than the grower did in one year's work. One uninformed farmer who sold the crop from a large orchard, lost between \$3000 and \$4000 in failing to obtain the market price. He had been urged to join the growers' organization at the trifling expense of less than \$20, but neglected to do so. As a community proposition, it is far better if the profits remain in the community, and are spent there, than to have some outside speculator carry away the \$4000—to buy, perhaps, champagne and supersixes.

When the speculator buys from the uninformed and unbusinesslike farmer at low prices, do you think the consumer gets the benefit of it? Not on your birthday!

Contra Costa's agriculture will never be really prosperous until our fruit-growers and farmers organize so as to get a fair share of the consumer's dollar. While the packer and merchant should have a fair share, with proper co-operative effort the products of the farm can be sold to the consumer at a fair price, and packer and farmer reap a reasonable recompense for investment and work. Will the farmers of Contra Costa see a light, and avail themselves of the opportunities now offered through the activities of the State Market Commission, and through co-operative organizations now being formed elsewhere, or will they be content to struggle along, as in the past, making a little money in good years, and running behind, and getting into debt in the bad years?

Let's be optimistic, and for the good of the community hope that they will join in the onward march of agricultural progress.

Contra Costa.

MR. ETTER ON A GREAT APPLE TRAIL.

To the Editor: I am sending a collection of some of my new varieties of apples. I have pried the lid up enough to peek under and it looks good to me—a veritable treasure house that is going to give us new apples in varieties by the hundred. The prospect looks so encouraging to me that I am proceeding to develop thousands of seedlings. The preliminary work is now done and the light good to go ahead at full speed. The whole problem is now as simple as breeding up a herd of good dairy cows when one has a good herd to begin with. I have probably 50 varieties as good as those I am now sending because they are now ripe. I will probably send more samples later as they ripen.

Albert F. Etter.

Ettersburg, Humboldt Co.

[The foregoing is a personal note, which we take the liberty of printing because it reveals the spirit and enterprise of the writer better than we could describe them in a column of type. The apples, which came through the parcels post as sound as a shipment of baseballs, show a basic shipping character like our best winter apples which is invaluable in a lot of apples ripening so early. They are remarkably beautiful, juicy and crisp, which they must be to be really good. There is great variety in solid hues and in stripes and they have a clear, waxen finish which is notable in a bunch of apples grown so near the coast. It seems to us that Mr. Etter has the stuff in himself and in the strains he is working with to mark the apple list of the next generation all over with California varieties. And fortunately he is still young enough to do this before he can get old and lazy.—Eds.]

TULARE CO. FRUIT PLANTINGS, 1916.

[Written for Pacific Rural Press.]

"Probably prunes, peaches, figs, olives, oranges, lemons, and grapefruit represent 90 per cent of the planting," writes Tulare County Horticultural Commissioner Chas. F. Collins. In addition to the common fruits planted, the following were shipped into Tulare county last season, according to Mr. Collins: Pomegranates 2896 trees; grapefruit 1208; persimmons 566; avocados 371; nectarines 350; quinces 281; grape cuttings 798; fig cuttings 112; rooted olive cuttings 170,000; plum seedlings 50,000; orange seedlings 7000; apple seedlings 5,000; pear seedlings 5,000; and cherry seedlings 3,000. Over 40,000 ornamental trees were shipped into the county last year, beside numerous subtropical fruits and nuts.

It has been definitely announced the sugar refinery in Fallon, Nev., will be operated next season.

How a Muscat Crop Was Doubled.

It Didn't Look Reasonable, but Instructions Were Followed and the Crop Harvested. The Methods Are Given Here and in Other Articles to Come.

[Written for Pacific Rural Press.]

The crops from 37 acres of Muscats 30 years old have been about the following as estimated by A. B. Cate of Fresno county for the years he has worked that block, beginning in 1910: About 22 tons of raisins, in 1910; 27 next year; and 50, 37, 30, 35, and 70 tons, the last figure representing this year's crop.

Here is how Mr. Cate says the crop was developed.

There are differing conditions requiring half a dozen different treatments of various parts of Mr. Cate's vineyard. One corner, including three acres, was plowed and cross cultivated but never watered. From one vine in this piece we picked on Sept. 15, two overly full raisin trays.

Another corner was plowed, cultivated twice, then watered three times and cultivated twice after each irrigation. Mr. Cate emphasizes the fact that Frank Henry's system of grape culture which he followed implicitly this year, is a matter of observing the needs of the vines under the varying conditions, and no rules can be followed without inspection weekly or nearly as often and special instructions according to conditions of soil and water-table as indicated by the vines.

Yet Mr. Henry makes no secret of his methods nor of the "why" of them. Some people have applied them half-heartedly or incompletely, some have hated to admit that a young man could tell them anything about grape growing; and there is some opposition to discussion of the Henry system. Half understanding it or half doing it does not produce results and does produce knockers.

But where followed consistently, it has produced remarkable results for two years, and this fall's crop of fruit and fruit canes for next year justifies our faith as exhibited in previous articles.

System.—The weaker vines were pruned in February to avoid "bleeding." The stronger ones were pruned in March so they would bleed and hold back spring growth till after danger of frost.

Right after pruning, the orchard was cultivated both ways with Planet Jr. Shovels, to conserve winter moisture. When shoots were three to six inches long and forms of bunches were just beginning to show, the plowing was begun, lasting from April 4 to 22. This cut many surface roots, and prevented the run of excess moisture to the bunches at blooming time, which Mr. Henry claims is the usual cause of coulure, or failure of grapes to set on the bunches.

Before plowing was done, "pinching" was begun, lasting Apr. 15 to 23. The tip was pinched or broken off above every form of a bunch. This not only diverted what sap was flowing in the vines, from the tips into the bunches, enlarging the stems while they were yet soft, but it also caused laterals to be promptly thrown out which bore a second crop so early that the second crop ripened almost with the first and was picked at the same time, a little later than many crops. The pinching took 23 days' work, figured at \$2 per day.

Sap flow was further discouraged during blooming in May, by not cultivating; so that the ground dried out considerably. Seven days of team work are recorded in that month, cultivation having begun late in May when grapes were just set or up to the size of peas. This cultivation was designed to save whatever of moisture was left in the ground.

The first irrigation was a light flooding June 13 on 34 acres. This took six or seven days and nights with two feet of water. Cultivation

Forelle Pears

Sold for \$8.95

in half boxes on New York auction Sept. 21. Concede in similar packages sold for \$3.60. These and all other leading commercial varieties—all grown on Blight-Proof and Aphid-Resistant roots—simply tree perfection. While we sell all kinds of nursery stock we specialize in pear trees of **HIGHEST QUALITY**. Supply quite limited and selling fast. Write for prices, if you appreciate high-grade trees, stating quantity you will plant and describing your soil. Our advice on varieties costs nothing but may make a big difference in your profits.

SUPERPHOSPHATE

is a splendid fertilizer for

ALFALFA, WHEAT, ORANGES, PRUNES, ETC.

The Mountain Copper Co.,

332 Pine Street, San Francisco

was started on this rather light soil, two days after beginning irrigation. The subsoil is sandy with no hardpan, and the water-table has been found four to seven feet down, in June.

Following irrigation, the vineyard was cultivated both ways, then harrowed both ways to a fine mellow condition. The second irrigation came a month after the first, and similar cultivation followed immediately. This irrigation took four days and three nights with three "feet" of water. An extra irrigation was given later along a row of fig trees which were taking more moisture than the vines alone would. Team work took 12 days in July, cultivating. Otherwise than two sulphurings, nothing more was done until picking time.

Expenses up to June, aside from Mr. Henry's pay and the sulphur, were not over \$10 per acre, as figured on three different blocks, including this one. But there was more watering and cultivation after June 1 of this year, than ever before after June 1.

Difference from Previous Years.—To make the preceding half crops, Mr. Cate had started team work in March, plowing twice but not quite so deep, long before blooming. He did nothing much with the team in April, but kept it busy through May, with a let up in June and only seven days in July. He flooded in March after the first plowing, and again by furrows from tubes in ditch banks, in June, right after cultivation.

Pruning.—The winter pruning was done differently this year than before, but that makes another story.

FORTY-NINTH STATE FRUIT GROWERS' CONVENTION.

The program for the Forty-ninth State Fruit Growers' Convention, which is to be held at Napa, California, November 15th, 16th, and 17th, is already assuming definite form. The mayor of Napa has consented to give the address of welcome. The response by the State Commissioner of Horticulture will be followed by the report of the Committee on Horticultural legislation. The dried pear industry of California will be discussed by Fred G. Stokes of Kelseyville, Lake county. A topic which is particularly of interest at this time is the Standardization Law. The weaknesses of this Act will be discussed by Mr. F. B. McKeivitt, president of the California Fruit Distributors, who has had a large experience in the workings of this enactment. Mr. Fred P. Roullard, horticultural commissioner of Fresno county, will give a short talk on the practical application of the law as applied to grapes. Further discussion of the Standardization Law in its relation to the shipment of fresh deciduous fruit will be given by Mr. H. E. Butler, of Penryn. The practical application of the law with cantaloupes will probably be discussed by Mr. W. Fawcett, of El Centro. The future of the wine grape industry will be presented by Mr. E. M. Sheehan, Secretary of the State Viticultural Commission. The future of the raisin industry will be given by Mr. James Madison, manager of the California Associated

Raisin Company. The Prune and Apricot Growers' Bureau will be discussed, as will the subject "Marketing through the Medium of the Parcel Post," speakers yet to be selected. The subject "The Scientific Distribution of Farm Products" will be ably presented by Colonel Harris Weinstock, who needs no introduction to the California fruit growers. A general discussion will follow this topic.

Professor Elwood Mead, of the University of California, and the California State Commission on Colonization and Rural Credit, has consented to talk on Rural Credits.

Other subjects for which speakers have not yet been chosen are: "The Peach Growers' Association"; "The Farmers' Free Market," and "The

Disposition of Fruit below the Established Standard."

"The California Farmer and the College of Agriculture" will, in all probability, be given by Dr. T. F. Hunt, Director of the California Agricultural Experiment Station. "The Improvement of Nursery Stock" will be discussed by the following well-known nurserymen: Mr. Geo. C. Roeding of Fresno; Leonard C. Coates of Morganhill, and A. L. Wisker of Grass Valley.

MISCELLANEOUS.

Yucaipa held an apple show Oct. 5 to 7.

Ventura County foothill lima beans are making 35 sacks per acre this year, about 5 sacks better than last.

About the best and tallest corn

we have seen, grew this year in the Kings River bottoms of Fresno county.

Sixty varieties of produce from one ranch won first prize in that class at the Fresno District Fair for A. B. Cate of Clovis.

Deciduous trees in Southern California are losing their leaves earlier than usual, and an earlier movement of nursery stock is expected.

The new method of grading peaches and the reasonable price offered will be the salvation of the peach industry, says a letter to the California Peach Growers, Inc. from a large Eastern jobbing house.

An absolute quarantine against all imported citrus fruits, trees, buds, and scions has been established by Acting Commissioner of Horticulture Geo. P. Weldon. It is a precautionary measure against the introduction into California of the citrus canker.

Let Trees Grow Up With Him and Make Him Rich

Start This Season

Plant an orchard for your boy—even though it be only a few trees to start with. The years go by rapidly and it does not take long to double and treble the value of land with a well planted, well kept up orchard.

But when you plant-----Be sure you plant Roeding's True Trees

—known all over the world for their splendid quality—vigorous, hardy, prolific, true to name. You know that fruit growing is the most profitable end of farming, but as it takes some time for the trees to come into bearing, it pays to make sure in the first place that the trees you plant are of pedigreed stock and will produce fancy fruit—the kind that brings fancy prices.

We grow everything that grows

Fruit and Ornamental Trees, Vines, Shrubs

For the coming season we have a magnificent stock of nearly everything wanted by the planter—apricots, almonds, apples, pears, plums, prunes, peaches, nectarines, cherries, walnuts, pecans, olives, oranges, lemons—evergreens, palms, roses, climbing and trailing vines, border plants, etc.

We'll gladly advise with you—FREE

Whether you purchase of us or not we will gladly give you the benefit of our many years of experience. Tell us the nature of your land and what you propose to set out. It will cost you nothing to get Roeding's advice and quotations. Write us today.

Fancher Creek Nurseries

Mechanical Power on the Farm.

Users of tractors, engines, pumping plants, motor trucks, automobiles, electric motors, and other mechanical farm power are invited to make this department an exchange of your experiences and troubles.

CRITICISMS OF A TRACTOR USER.

[Written for Pacific Rural Press by S. I. Merrill, Kern County.]

Three years ago, myself and two adult sons, owning jointly over eleven hundred acres of land which was strongly addicted to growing sagebrush without irrigation, decided to reform this propensity of the land by trying to grow crops on it of more marketable value by the aid of irrigation. A tractor was deemed a wise investment, and we began with a 75 h.p., large-wheel tractor. We found it nicely adapted to hauling big loads on good roads, but it was too heavy to work well upon our soil without extensions to the wheels, and we had no extensions to put on. After two months, we sorrowfully set it aside, and purchased a new track-type tractor, because our plows and other implements were too heavy for teams, and we had not, up to that time, derived all the tractor experience that was "coming to us." We believed that a track-type machine was more suitable to our soil and for carrying out our plans, and we have not been disappointed. We are not therefore detractors of tractors; but tractor manufacturer's methods can in some directions be considerably improved upon.

A tractor, for some kinds of work, is all right. It splendidly fills a need, therefore has a place, but, it should be kept in its place. On large farms that grow sugar beets, grain, and similar crops, nothing can take the place of large tractors for economy and big accomplishment. Manufacturers should, by all means, be encouraged to make them, but in their eagerness to sell them they should not forget the principle of the Golden Rule and they should be cautioned against trying to put their tractor in the wrong place. As an example: A large powered tractor from 30 h.p. upward, to do all kinds of work on a farm, is neither right, wise management, nor profitable in the long run, and such practice will react upon the concern that advertises it.

High power tractors cannot pump water as cheaply as stationary engines, nor perform any stationary work as economically as small engines or electric motors can. They are valuable for developing new water wells to ascertain what size engine will be needed to pump what water the well will produce, but to urge their use for running corn shellers, small domestic water pumps, sawing wood, and doing a lot of things that engines and electric motors of three and five h.p. can do at one-tenth the expense is worse than foolishness. A person is never justified in running a big machine to perform little work on the ground merely that he has a large investment in a machine and he wants to keep it working. An emergency may sometimes compel the use of an expensive "makeshift," but ultimately, "makeshifts" are almost always expensive if long continued. The extra cost of running a large machine in wear, fuel, lubricating

oil would, if saved, soon buy a small engine to run the small units.

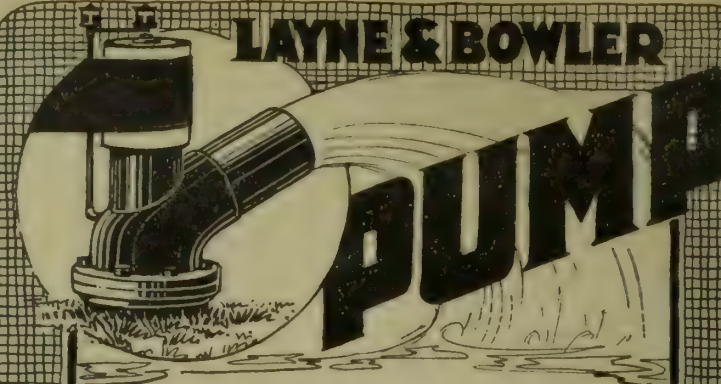

There is a field for large power tractors—there is where they belong—in the field. They do not successfully compete with teams on irrigated farms where the irrigating checks are small or irregular in shape. A tractor may turn around in a twenty foot space, but it cannot drag its plows and other implements around and do efficient work there.

We are strongly pro-machinery men for farming. We have an automobile, a motor truck, and other machinery. We tried, at first, to do without horses, but, living as we do in an irrigated district it was found that a team is indispensable. After borrowing and hiring teams from time to time, and paying over a hundred dollars in this way, we bought a team and equipment for ourselves.

Tractors of large size are excellent for doing certain kinds of contract work, for then they are run as near to their full capacity and endurance as possible. It is a false statement that "when they are not working they do not eat, as teams do," when the statement is intended to convey an idea that they can be allowed to remain idle more economically than where teams are used. Large size tractors cost from \$3,000 to \$6,000 including the implements that go with them, which, at eight per cent interest eats \$240 to \$480 a year. Depreciation and upkeep eats 20 per cent or from \$600 to \$1,200 a year more. Taxes eat some. Loss of time eats when something goes wrong, or some part breaks and a long-time wait occurs to get a needed part from the factory, which is not infrequent. If a horse or mule gets sick or disabled another can be borrowed or hired near by. Not so with disabled machinery; only one place to get it and the price is on a non-competitive basis. Nor does the manufacturer's guarantee afford much relief to the buyer, because he is not reimbursed for his lost time and other losses; not even the freight is borne by the factory on the defective parts.

It would be only fair if the factory were compelled to pay a reasonable amount of the loss sustained by a purchaser whenever it can be clearly shown that bad workmanship, negligence of employees, or mismanagement on the part of the factory, has imposed such loss upon the purchaser. We lost \$250 including six weeks' time on our tractor just because the oil level was not properly placed before it left the factory. They refused to make reparation, and we could get no redress without a law suit. The factory claimed that they were not obligated to do more than to re-bore the cylinders, and required us to pay the freight both ways, notwithstanding that the fault originated in their own factory.

It is true that teams get tired and have to stop occasionally to rest. It is just as true that tractors have to be stopped occasionally to "screw

LAYNE & BOWLER

PUMP

YOUR FINAL CHOICE

A significant consideration for the prospective pump purchaser is that the majority of those who have difficult pumping problems to solve finally select the Layne & Bowler Pump. With over 20 different styles of Layne & Bowler Pumps to select from, you are able to get practically a made-to-order pump at the price of a regular stock pump. Consult with us now and we will show you positively how you can produce absolutely the cheapest water. Our Catalog No. 25 is brimful of interesting information. Ask for a copy.

up the grease cups" and to see that the bearings are running cool; to keep the water tank supplied; to take out spark plugs and clean them when "she is running on only three cylinders instead of four," and some other stoppages that are more tiresome and exasperating than sitting down while the team rests. When teams are not working they at least produce a valuable fertilizer, and tractors do not.

The cost of feeding a team is under ten dollars a month when employed, and less when they are in pasture, and the farmer grows the feed. The cost of keeping a tractor when idle, amounts to, as previously shown, \$75 to \$150 a month in interest, depreciation, taxes, etc. The

SAVE HALF YOUR ENGINE MONEY

1 If I can make only \$1 clear profit on each engine I sell, I can buy a good farm each year. What more could I ask?

2 Regardless of price and profit, I am building just as good an engine as I know how. The name WITTE will never appear on any but high quality engines.

3 WITTE engines are built by experts—men who do nothing but specialize on engines. It has taken me 30 years' hard work to build up my factory organization. These men hold their jobs because I believe that each is the best in the country in his line.

4 Our own natural gas well right in the factory furnishes free fuel for power. Without this, the coal bill would run thousands of dollars a year. You get the benefit of this saving.

5 WITTE engines are sold only direct from factory to user. Former retail prices on my engines were more than double present prices.

6 There is a clean business record of 47 years, and an engine building record of 20 years, back of every WITTE engine—never a "failure"—a consistent "spot cash" record. That is why we can buy material at rock bottom prices.

7 A wonderful factory equipment. By devoting the energy of the factory to exclusive engine building, I have been able to construct a great system of machinery that, in the hands of my experts, makes all parts with exactness and great speed.

Just write your name and address on a postal card or scrap of paper with the words "How to Judge Engines," and we will send our new, valuable, big book on engines absolutely free. Also our

90-Day Trial Offer
Easy Terms of Payment
5-Year Guarantee

Remember, we have no dealer in your town to describe our engines to you. You must write to us if you want a WITTE.—Ed. H. Witte,

WINTER IS APPROACHING

HOW ABOUT YOUR FARM BUILDINGS?

Are they in shape to protect your crops, your stock, your machinery, implements, etc.?

Remember that galvanized iron building materials are practically everlasting.

We can supply complete lines of V-crimped roofing and siding, metal shingles, roof gutters, etc.

Also stock watering troughs, tanks, and A. I. Irrigation Pipe.

Let us know what you need in galvanized iron materials. We are in a position to supply you.

AMES IRVIN CO.

8th and Irwin Sts.,
San Francisco.

tractor can do the work of from fourteen to thirty teams, so that, on large jobs of plowing and other work where the full power of the tractor can be utilized, and for long periods, tractors are pre-eminent. But farm work only calls for such periods occasionally, and so a farmer would better study carefully his needs, before getting high-priced machinery. A low power tractor might suit his requirements better, and at very much less cost, or he might find it best to continue with teams.

Farms are being specialized, so should tractors. There are grain farms, dairy farms, citrus groves and deciduous orchards; why not a special tractor for each class? Why expect unreasonable things of a tractor, and think one should be built to perform all the requirements for power on the farm. A farmer having much driving to do does not use his heavy team to do it; he buys a light driving team that will do the work easier and better. Nor does he buy a heavy farm wagon with a view of taking his family to church in it, although it might serve the purpose after a fashion; he buys another vehicle for that purpose if he is at all progressive. Heavy power for heavy work; light power for light, is the only motto that harmonizes with the trite business maxim—"Maximum of results with minimum of expense."

And so with tractors. The manufacturer who will carefully select his field and then make a tractor that will fill the needs of that field; who, like Henry Ford, will aim to reduce the price and improve the quality each year; who will place repair parts in the hands of tractor owners at a slight advance over cost of production; who will promptly, faithfully and generously treat all complaints as they arise; whose settled policy shall be: We serve our customers, not exploit them—will find that such a policy will sell more tractors than a display room hung with gold medals and blue ribbons.

POWER NOTES.

Power lift gang plows of several makes caused much comment at the Puente tractor demonstration.

On two days the driver of the big Caterpillar at Puente did not pull his clutch from beginning to end of the general public demonstration.

Round wheeled tractors with long grousers seemed at the Puente demonstration to cut up and loosen the hard ground whether on top or in the furrows, putting it in better shape to turn under.

The University Farm offers a free Short Course to teach farmers how to drive tractors economically. It will come off Nov. 10 to 24. Yuba, Holt, and Best machines are now available for study.

A farmhand makes a better driver than a mechanic for the small tractor, because the mechanic gets careless on a simple machine, while the farm hand watches it carefully, keeping oil and bolts properly adjusted, says an experienced tractor man.

Four Big Bulls are used on a 240-acre orange orchard by E. W. Kilian of Tulare county. Except in the busiest season, some of them may be overhauled by a mechanic while farm hands operate the others under orders not to tamper with the machinery.

The Bates Steel Mule Co. begins a contest Oct. 1 for 10 prizes totaling \$1000 to be paid its customers for greatest efficiency in work, at least cost of upkeep. Contestants must make out reports showing work done with the tractor each day and the attention given to it. This keeps the company in close touch and enables them to recommend better practices. Contestants are guaran-

teed that upkeep cost will not exceed 25 cents per acre per year.

YUBA BALL TREAD TRACTORS

Are you a county Supervisor, or are you a taxpayer and want to see your county build good roads economically; or do you know that in either case the saving is being effected every day by other county officials, with the Yuba Tractor?

General Agricultural Review.

DECIDUOUS FRUITS.

The largest part of the Hollister prune and apricot crop has been sold, and is now in hands of packers.

The packing business of the California Peach Growers promises to be one of the important industries in Suisun.

County Horticultural Commissioner Chas. F. Collins believes the total fruit and grape crop of Tulare county has been a record breaker.

Over nine tons of Bartlett pears were picked from 70 trees in Lake county by Ray Huston and Claude Rowden this year, and were sold for \$40 per ton.

W. C. Chisholm, located near Windsor, Sonoma county, has sold his crop of prunes, probably the largest in Sonoma county, this year. It is estimated at 75 tons of dried fruit.

One hundred thousand cases of canned peaches was the output of the Central California Cannery at Yuba City this season. Last year year about 42,000 cases of peaches were packed.

George N. Herbert has purchased 110 acres of the Thomas Fisher estate, a short distance south of Coyote, for between \$70,000 and \$75,000. Mr. Herbert stated that he purchased the property owing to the great richness of the soil, which he considers the best prune land in the valley. His 25 years' experience in the packing business has taught him that the largest and highest quality prunes are raised in the territory running from Edenvale to several miles south of Coyote. He stated also that the biggest production of prunes comes from this section.

CITRUS, NUTS, SEMI-TROPICAL.

Over 250 carloads of lemons were shipped from Santa Barbara this season.

Growers are sending out a carload of almonds daily from their warehouse at Oakley.

Ten thousand olive trees have been set out, and 4,000 more will be planted next spring in the little town of La Grange, in the eastern part of Stanislaus county.

The Banning Almond Growers' Association shipped five carloads of nuts recently, most of them going to the State Association warehouse for distribution.

G. W. Pierce, president of the California Almond Growers' Exchange, will visit every almond growers' association in California and interview personally as many of the 1265 member growers as possible.

Appearances indicate that the Santa Barbara olive crop will be but one-third of what it was last year. The Santa Barbara Olive company is planning the erection of a factory shipped from Santa Barbara this on the Modoc road outside the city.

The walnut crop in Goleta valley ran almost 93 per cent No. 1's, according to grading done at the Goleta walnut house. The association pays the growers 15½ cents a pound for the No. 1 nuts, No. 2 bringing 12½ cents a pound.

The sale of the Fogg olive grove of forty acres in Thermalito to the Ehmann Olive Company has been announced. It is understood the price was in the neighborhood of \$50,000. The grove was planted twenty-eight years ago, and has a State-wide reputation for producing large olives.

The Riverside Citrus Experiment Station is planning an orchard institute to take place the third week in November, when ranchers and those interested in agricultural subjects will be welcomed at the station and a splendid series of programs will be presented. Cultivation, irrigation, fertilization, test control and other subjects will be discussed.

The first carload of figs from the

Bald Eagle ranch owned by the McHenry Brothers, located just west of Modesto, has been contracted to the Roeding Fig and Olive Company of Fresno. This fig orchard comprises 42 acres. The trees are twenty-nine years old. This is the largest bearing orchard of the kind on the coast. The crop is heavier than ever—six carloads or 360,000 pounds being now ready for sulphuring. They are Calimyrnas.

GRAPES.

Table grapes have been shipped East in good quantities from Merced, Atwater and Livingston, and for the first time in years wine grapes are being sent East in quantity. Five cars of the latter went to Chicago on one day recently. The recent rain did practically no damage to the fruit in that section.

While there have been heavy grape shipments of Tokays to the East from Lodi district this season, the berries are not as large, as uniform, or as well colored as they were last season. The wide range of prices shows that a quantity of inferior grapes have been shipped. However, the outcome of the season will be satisfactory to the growers.

FIELD CROPS.

A fine seed bean crop is being harvested in the Santa Ynez valley.

The bean crop in Yolo county is 100 per cent better than last year.

The damage to drying beans from rain in Ventura county has not been serious.

In the Imperial Valley two bales of cotton to the acre is grown this year in some instances.

The Visalia Sugar Factory ran for twelve weeks this season, the longest consecutive run on record.

It has been definitely announced the sugar refinery in Fallon, Nev., will be operated next season.

A new variety of rice (No. 81) developed in Butte is proving most successful. It is an early ripening rice.

The Riverside and Arlington Chambers of Commerce want a beet sugar factory for the Riverside district.

Some Yolo county people are busy dredging the outlet of Clear Lake, so as to get more water for the rice fields in the valley.

Pound for pound, Imperial valley cotton is more profitable to the grower because the bright sunlight of the valley bleaches it.

The sale of 100 bales of cotton in the Brawley district has started the buyers to come to Brawley and the rush season is now on.

A party of Japanese students and professors has been in Tulare studying the rice and fruit industries of Tulare and the Tulare lake region.

MONTHLY CROP REPORT.

From the State Commission of Horticulture at Sacramento the following estimate of citrus fruit was sent out as of Oct. 1st: Oranges in the six principal producing counties are estimated for the coming crop as follows: Los Angeles 90 per cent; Orange 100, Riverside 80, San Bernardino 95, Tulare 90, Ventura 100. These six counties are credited with producing 96 per cent of the oranges grown in the State, and the report indicates the prospect of a very large yield. In the seven principal lemon counties, producing 97 per cent, the crop estimate is: Los Angeles 90, Orange 100, Riverside 90, San Bernardino 90, San Diego 75, Tulare 95, Ventura 100.

Olives are estimated in the 15 principal producing counties as follows: Butte 40, Fresno 100, Los Angeles 80, Madera 100, Riverside 60, Sacramento 80, San Bernardino 75, San Diego 100, San Joaquin 75, Santa Barbara 100, Sonoma 75, Tehama 33, Tulare 90, Yolo 60, Yuba 60.

CORN AND ALFALFA IN LAKE CO.

[Written for Pacific Rural Press.]

The McKinley Brothers, one mile north of Middletown, Lake county, are the lucky owners of a \$200 silo. It is the first one in this part of the country. In spite of cool and dry weather in the spring, the boys raised corn enough to fill it the first year, giving them about 60 tons of silage. They also raised five cuttings of alfalfa, giving their milk stock a good ration for the winter. A sixth cutting of alfalfa could have been obtained, but owing to the extra work of silo-building the cows were left to graze this last crop. The boys intend to seed some of their land to alfalfa every year. Water for irrigation is obtained from a creek on their place. In the summer a good market for butter is found right at home. The nearby health resorts are good customers. Durham cows are kept on the place, crossed with Holstein bulls.

Mr. R. M. Collins is another successful alfalfa grower. All his low land is seeded. Mr. Collins has planted the high land to walnuts, which are doing well.

RAIN DAMAGES GRAPES.

While it is too early to say, at this writing (Monday), to what extent the raisin crop of Fresno county has been damaged by rain, it is sure to be considerable. The heaviest loss is anticipated in vineyards where paper trays were used, it being impossible to stack them and the water both on top and bottom is certain to cause mildew. Even those vineyardists who had wooden trays will suffer a loss because of scarcity of labor for stacking. Raisin men predict a still heavier loss if the rain continues as many of those in stacks need sunshine already.

Green grape shipments have been cut in half and while some of the Malagas will be cleaner and more marketable, lower bunches will be spoiled. It is not thought that the Emperor crop will be affected.

Live Stock and Dairy Notes.

(Livestock breeders all over the State are invited to send on postal cards, notes regarding their sales, State and County Fair intentions, new stock, etc.)

DAIRYING AND DAIRYMEN.

C. H. Schmidt of Selma is reported as a new breeder of purebred Guernseys.

Mr. G. W. Stone of Tracy will establish a milk-sterilizing plant at Watsonville in every way up to date.

H. K. Kinkead, near Fallon, Nev., has the largest dairy in this district. He expects to milk 100 cows this winter.

Frank A. Tetley of Riverside has sold the fine herd of Holsteins on his Calxico ranch, which will be leased for a term of years.

Forsberg Bros., who own the Alfarada dairy at Fallon, Nev., have recently erected a silo—one of the very few in that State.

Members of the California Creamery Operators' Association spent a day at Arcata, where a thousand farmers assembled to greet them.

Under the new State law which went into effect Oct. 1 all milk food products must be pasteurized unless obtained from non-tuberculous cows.

The manufacture of casein from skim-milk has been started by the Milk Products Corporation of Delaware at its plant just completed in Modesto.

The San Luis Obispo Dairy Breeding Association has appointed a new board of directors, one representative from each of the districts embraced in its membership.

The University of Nevada recently purchased a herd of 22 grade Holsteins to be used wholly for the purpose of feeding dairy products to the students in the dining room.

Arlington Smith of Visalia has purchased four registered Ayrshire heifers and a registered bull from Steybrae Farm, San Mateo county, which he will use for foundation purposes.

Frank Helm of Fresno is founding a herd of registered Guernsey cattle at his ranch near Fresno, the milk from which, together with that from his registered Holstein herd, will be certified.

A note from C. D. Conway of Ripon states that our report of the Chester White swine awards at the Modesto fair was not correct, in that her aged sow Edna Aug No. 3775 was awarded first prize. Her hogs were also awarded first prize at the Ripon fair.

About 40 of the boys of the Gardena Agricultural High School will attend the Rancho Santa Anita purebred livestock sale as part of their class work. They hope to hear breeders' criticisms and learn to be better judges of cow values, according to Prof. J. B. Lillard.

Bull calves out of Alba Sadie Cornucopia Creetia, the State record Holstein cow, Miss Valley Mead De Kol Walker, State record senior two-year-old, and Mosetta Mutual Paul Johanna, a promising world record cow, and a son of Prince Gelache Walker, will be sold at the October sale of the Santa Anita Rancho. This is high class stock.

The Danish Creamery Association of Fresno gives gross receipts for

August at approximately \$100,000 and the production in excess of 300,000 pounds of butterfat. The payroll for the month amounted to \$47,582. The production was 150,870. The average price was 32 cents per pound, 1 cent a pound higher than August of last year. In August, 1915, the receipts were \$42,692.78 and the production 139,973 pounds.

Three men bought three purebred Guernsey cows and a bull in co-operation, last year, to start a community breeding center in Ventura county. They are E. O. Tucker, J. M. Dickenson, and Jas. Sharp of Saticoy, and their exhibit at the county fair of cows with calves attracted much attention.

Organization is being urged upon the milk producers by the Sacramento Valley Development Association, and is in charge of James M. Henderson Jr., chairman of the milk producers' committee of that body. The plan is to form a co-operative association through which the farmers can market their dairy products along lines similar to other farmers' organizations now in effect in California. The committee in charge, besides Henderson, includes C. L. Hughes, E. Franklin, Senator B. F. Rush and W. A. Beard.

The cup offered to the owner of the cow producing the most Butterfat from Oct. 1, 1915, to Oct. 1, 1916, by the Chico Business Men's Association was won by S. A. Mealey of Gridley, whose grade Holstein cow "Beauty" produced 9,622 pounds milk, containing 422.6 pounds butterfat. Seven cows in the Association produced over 400 pounds fat in that period. At a meeting of the Association Sept. 30th, the following officers were elected for the ensuing year: J. H. Guill Jr. of Chico, President; Henry Wickman of Gridley, Vice-president; S. F. Bonner of Gridley, Secretary and Treasurer.

BEEF CATTLE.

Six fine Shorthorn bulls shown at the State Fair were bought by Julius Trescony and shipped to San Lucas.

Four hundred head of beef cattle have been shipped into Poplar, Merced Co., to be fattened on alfalfa and reshipped to Nevada.

It is thought that cattle-rustling has been stopped entirely in Tulare Co., due to the system employed of notifying prospective buyers to be on their guard, thus preventing stolen stock from being sold.

A. T. Sauza of San Luis Obispo Co. bought 75 head of young cattle from James Barrie at Marigold, 50 from P. V. Ashford, 27 from Mrs. J. Bailey and 13 from Miss M. Hobbs of Tudor.

Legend Novena Teake, senior yearling first prize winner in the Holstein bull class at the late Modesto fair, exhibited by George Kounias, was sold to a West Side dairyman for \$350. This bull was a year old in February last, and was classed by Judge True.

Phil Collins, a well-known Gonheavy beef cattle. These are some of the weights: 6-year-old cow, 1562; 5-year-old cow, 1240; 4-year-old cow, 1250; 3-year-old cow, 1290; 2-year-old cow, 1020; 1-year-old cow, 950; 2-year-old bull, 1270; 4 calves, \$1980.

Prices of meat animals were 23.7 higher September 15 than on the same day of last year—and showed an increase over August 15 of this year of 4.1 per cent, according to the agricultural department. Beef cattle averaged throughout the United States on that date \$6.55 per hundred pounds against \$6.51 a month ago and \$6.06 a year ago.

HOGS AND SHEEP.

F. V. Gordon, Los Angeles, has recently placed on his ranch near Perris, known as the Llano Vista (Continued on page 390.)

AT AUCTION!

200 Horses and Mules

THURSDAY, OCTOBER 12, 1916.

On account of expiration of lease, we will sell all personal property on the Linden Stock Farm, consisting of 100 three- and four-year-old mules, 25 work mules, 75 draft and all-purpose horses. The mules will be sold in spans or carload lots to suit purchasers.

ALSO

Registered Berkshire Hogs

including the prize-winning boar, Bandmaster 2nd, and a number of sows with litters sired by him. Also all farm machinery used on this 700-acre ranch, including wagons, plows, harrows, drills, 1 four-ton auto truck, 1 seven-passenger automobile, and all household goods.

BANDMASTER 2nd.

Sale takes place on the farm, three miles north of Linden and sixteen miles northeast of Stockton, at 10 a. m. Thursday, October 12th. No outside stock offered or permitted at this sale.

Livestock Facts and Fancies---III.

[Written for Pacific Rural Press.]

In last week's issue we promised to stop scolding and tackle some concrete instances of the importance of purebred animals in the practical operations of farm production. But it is necessary, first, to indicate how such instances can be recognized so that every farmer can seek them for himself and depend upon no one's "say so" for it. As we are not a "professor of animal industry," we have no pretensions to scientific expertness nor orthodoxy, and if any one feels like slamming our examples or precepts he has right and welcome to do it. If he wishes to do it for print in these columns, it will make more fun and do more good also, probably. If our doctrine gets a sharp horn in the side we shall run for a "doctor book" or perhaps for a real doctor—according to the place and depth of the horn-ing.

Years ago it used to be quite popular to claim that purebreds were of no account to the practical farmer, that they were the pampered playthings of rich cranks who did not care if their meat or butter cost them a dollar a pound, so long as they could get their names and pictures into the farm papers. This was never really true. There was, perhaps, more reasonableness in the claim years ago than now, though it has never rested on reasonableness, but on prejudice resulting from lack of knowledge of what the purebred animal is, how it came to exist and what it is good for or what can be gained by owning and using it. Such ignorance is much less now than formerly, but still there is still enough to warrant effort to remove it.

One can hardly place himself in the right attitude toward the purebred animal of any kind without gaining some knowledge of where it came from, how it came to be what it is, what are the external signs of its suitability to particular purposes and what are the requirements to secure in its progeny the maintenance of such suitability or the increase of it. One can still learn something of these things by studying animals, their forms and ways, making comparisons of many of them and by talking these things over with other observers. This is probably the way those who started centuries ago on the long road which has led to present standards of excellence of animals made their beginnings. It is, however, too late in the history of the world to begin that way and to be content with what one can attain by the use of his own eyes and thinking outfit. He needs to know what preceding generations of men have seen and thought and to use his eyes and brain to build upon the foundations which earlier human experience has shown to be straight seeing and sound thinking. He needs this foundation of knowledge that he may understand the significance of what he now sees. Even if he has already learned much by observation and current discussion, it is still of great advantage to him to test his present conclusions by learning their relations to the recorded results of studies, observations and conclusions of others

which constitute the recognized wisdom of the present day. Therefore we are sure that no one who finds himself properly attracted by the achievements of purebreds as they casually come to him should be content with such measure of knowledge as comes to him through the sights and gossip of the fair exhibits or the sales' rings, but should try to get at the foundation of all that is really true which underlies such events.

It seems to us that the way to approach fundamental knowledge of purebreds and their characters and usefulness is to read, ponder and digest such a little book as Davenport's "Domesticated Animals and Plants." It is written in attractive style and is especially designed to impart some knowledge of the essential principles that are fundamental to an understanding of heredity transmission and of the business of plant and animal improvement—throwing light not only upon the sources of materials out of which domesticated races have been made, but also many of the essential steps in improvement. Another book which should be studied is Plumb's "Types and Breeds of Farm Animals," which shows how the principles of breeding have been applied in the development of all our breeds of farm stock which are now popular, and sets forth the history of this development with striking illustrations of the ends attained.

One who masters the records of facts and principles set forth in these works is equipped to see better and listen more intelligently to the demonstrations of the truth at live stock fairs, at the University farm instruction, at Farm Bureau meetings, institutes, etc., and to appreciate the instances which are set forth in text and illustration in intelligent and conscientious agricultural journals. He is also well prepared to go far on seeing-expeditions of his own to breeding farms and farmers which are made profitable by practical use of improved animals of all kinds.

*Both these books are published by Ginn Co.—"Domestication of Animals" at \$1.25 and "Types and Breeds" at \$2. Any book dealer can get them.

LARGE CHEESE DAIRY.

[Written for Pacific Rural Press by Bert S. Wolf.]

What is probably the largest dairy in the Napa-Sonoma district is conducted by Filipini Bros. in Napa county near the Sonoma line. The Filipini boys, who were born on this ranch, are milking 250 Durham cows and own about 2500 acres of pasture land.

Their main milking barn has a capacity of 120 cows. Besides this, they are buying the milk of three other dairy farmers, amounting to 200 head of dairy cows. This milk is all made into cheese. They make up to 600 pounds cheese daily, and sell as fast as made. They are about to put in electric appliances for irrigation. They have a reservoir tank on their place that has a capacity of 32,000 gallons of water.

A GREAT SON OF King of the Pontiacs WILL BE SOLD IN A. W. MORRIS & SONS CONSIGNMENT TO Sacramento Sale, October 26-27

KING KORNDYKE PONTIAC, one of the very best bred sons of the great King of the Pontiacs, will be sold from our herd in order to make room for **KING MORCO ALCARTRA**, the young son of Tilly Alcartra.

His Sire—**KING OF THE PONTIACS**—the leading A. R. O. sire of the breed, has 188 A. R. O. daughters, seventeen above 30 pounds and two above 40 pounds butter in seven days.

His Dam—**MAY KORNDYKE 2ND**, a 26.31 pound three-year-old, sister to Prince Gelsche Walker, is by a 32.50 lb. sire and the 30.69 lb. three-year-old, May Korndyke, who is by Joe Gelsche De Kol Burke, sire of 4 thirty-pound daughters, and a 23.86 lb. cow. She is one of the best individuals ever owned in our herd, carrying about as near a perfect udder as it would be possible to find.

The conformation of this bull would be difficult to fault. He is beautifully marked. He has had light service in our herd for two years, and is a sure breeder.

Among the other finely bred bulls that we will sell in this sale is: A son of **PRINCE GELSCHKE WALKER** from a 27.30-lb. 3-year-old, who is by a 30-pound son of Paul Beets De Kol and from a good record daughter of Pearl of the Dairy's Joe De Kol.

A son of a 32-pound daughter of **DE KOL BURKE** by a 30-pound sire.

A son of a 27.50-pound daughter of **RIVERSIDE SADIE DE KOL BURKE** by a 30-pound sire.

A son of a 27.56-pound 4-year-old daughter of **KING MEAD OF RIVERSIDE** and a 33-pound cow.

The three nearest dams of several of these have yearly records averaging over 900 pounds butter.

GOOD in Breeding in Type in Individuality in Health

In fact, every possible effort has been made to have GOOD in every way

180 REGISTERED HOLSTEINS

TO BE SOLD AT PUBLIC AUCTION AT
CALIFORNIA STATE FAIR GROUNDS
Sacramento, California

OCTOBER 26-27, 1916

There will be a large number of most desirable heifers, including: Five daughters of **KING KORNDYKE SADIE VALE**, one of them out of a 29-pound cow that has a 34-pound 3-year-old daughter.

Four heifers of splendid breeding and safe in calf to **KING SEGIS ALCARTRA ABBEKERK**, whose sire is King Segis Pontiac Alcartra, the \$50,900 bull, and whose dam is a 30.27 pound 4-year-old daughter of Tidy Abbecker Prince.

Three daughters of a great A. R. O. cow, consigned by University Farm. A splendid daughter of the grand old cow, **MINNEWAWA JULIANA**, and sired by a 30-pound bull.

Eight good ones in calf to **KING MORCO ALCARTRA**, son of Tilly Alcartra, the world's champion long-distance dairy cow.

Fifteen daughters of a 33-pound sire.

Granddaughters of **KING SEGIS**, out of good A. R. O. dams.

Granddaughters of **KING OF THE PONTIACS**, out of A. R. O. dams.

BULLS.

If you want one of the best herds headers ever offered in the West, look over the ones offered in this sale. There are a number of the highest quality, including:

A son of the \$12,500 sire **PRINCE GELSCHKE WALKER**, out of a 27-pound 3-year-old.

A son of **PRINCE GELSCHKE WALKER**, out of a former world's record cow.

A son of **KING KORNDYKE SADIE VALE**.

A son of **KING KORNDYKE HENGERVELD ORMSBY**, out of a 22.86 pound 3-year-old.

A son of a 27.50 pound cows whose dam is a 33-pound cow. The three nearest dams of this bull average 30.25 pounds butter in 7 days and 930 pounds butter in one year.

KING KORNDYKE PONTIAC, whose sire is **KING OF THE PONTIACS**, and whose dam is a 26.31 pound 3-year-old half-sister to **PRINCE GELSCHKE WALKER**, and out of a 30-pound 3-year-old daughter of **JOE GELSCHKE DE KOL BURKE**.

Every animal over 6 months of age in this sale will be tuberculin tested by a Deputy State Veterinarian and certificate issued by the State Veterinarian. Buyers from other States will have absolutely no delay in securing shipping permit immediately after the sale.

TERMS OF SALE: One-third cash, balance on bankable notes, payable in three, six, and nine months at 8 per cent interest. All buyers desiring terms must positively make arrangements with owners before sale.

The following breeders will participate in this sale:

UNIVERSITY FARM, Davis.
FRED W. KIESEL, Sacramento.
TOYON FARM, Los Altos.

Fresno District Fair.

[Written for Pacific Rural Press.]

Fresno may rightly claim the big fair of all district fairs; indeed, the fair there last week was a close rival to the California State Fair.

Poultry has made a decided advance at this fair in spite of molting season, uncomfortably filling what was previously used for the agricultural displays.

Dairy Cattle: Some 200 or more dairy cattle were shown, Holsteins and Jerseys showing about even numbers and quality.

The \$500 in prize money for best dairy herds of 10 animals was largely responsible for the entry of some of the best show herds in the State, and this made class competition keen.

In the Holstein division the State Fair champions from the Morris herd, were too well balanced to permit defeat.

The Jersey show developed a new male champion in the senior yearling Golden Maidikins Boy, shown by S. F. Williams of Chico. The cow Valet's Golden Biddy of L. shown by N. H. Locke was again placed at the top of the female classes.

Guernsey championships both went to W. J. Higdon of Tulare. Ayrshires and Milking Shorthorns shown by Steybrae Farm and E. H. and H. L. Murphy respectively had no competition.

Herd Contest:—The outstanding feature of the dairy show was the herd contest, with six entries, three of which were Holsteins, one Guernsey, one Ayrshire and one Jersey.

From the beginning the ringside followers favored the four herds shown by Morris & Sons, Locke, Steybrae Farm, and Frank Helm. The ribbons were finally awarded to Morris & Sons, Steybrae Farm, and N. H. Locke Co. in the order named.

Swine:—Duroc-Jerseys and Poland Chinas predominated here. The Berkshires were equally strong in quality, both the champion and reserve champion boars at Sacramento competing. The Poland China boar Model Major, shown by Marsh of Modesto, was the sensation in the hog ring as he not only won everything, including championships in his own division, but went still higher and took sweepstakes over all breeds. He is a grand individual and was well shown by a man who was selling art goods a few years ago.

Duroc Jersey championships went to Fraser and Collins on the boar California Defender and to J. E. Thorp on an aged sow.

A reversal of State Fair placing was made by Judge Miller in the Berkshire championships by placing the under six month pig Winona Royal Champion 5th, shown by A. Smith, over the aged boar in the Murphy herd.

The show of O. I. C.'s was confined to the show herd of N. H. Locke Co.

Horses:—Local stallion owners and J. K. Macomber of Tulare County made the draft horse show with Percherons and Belgians.

PROPER PROTECTION FOR CALVES.

[Written for Pacific Rural Press.]

As pointed out in a previous issue of the Rural Press, young stock thrive much better, and make more rapid gains when furnished with shelter other than that afforded by the occasional tree or the lee side of a strawstack or outbuilding. The dairy plant at the State Hospital at Napa, to which reference was made, shows that due consideration has been given to this important feature of dairy stock work.

There a building has been erected with a capacity of 20 calves, having hay storage room overhead and concrete floor.

The building is long enough for 20 calf stanchions, which are placed along one side and separated from the outside wall by an aisle to accommodate the feeder. A board shelf in front of the stanchions has holes cut out for the milk-pails to set in.

On the other side of the building, hay racks have been erected, low enough so that the calves can reach the feed with ease. Through the center of the floor, running lengthwise of the building, a shallow gutter has been made in the concrete for drainage.

By this construction, the calves are fed under roof during the entire year. After feeding, their quarters can be flushed out with a hose and water so it is fully as sanitary as the milking stable. In wet weather they can, if necessary, be kept in day and night.

All of the calves raised on this

place are given alfalfa hay, whole milk, oil meal, and shorts, until old enough to be turned out on pasture.

An importation of 60 head of high class Berkshires has arrived at the Butte City Ranch at Butte City, Glenn county.

LIVESTOCK NOTES.

(Continued from page 387)

Rancho, a herd of 300 Hampshire hogs. Every animal is either a winner or their sire or dams have been winners at world's fairs or the State fairs.

Mr. A. C. Jones of Lower Lake shipped about 400 head of fat sheep to the San Francisco market last week.

Jos. Wilson of Mason, Nev., sold a boar pig to J. O. Perrazzo of Wabuska and a sow to Henry Atchison of Sweetwater, Nev.

The first marketing done by the Stanislaus Co. Farmers' Union was the shipment recently of a carload of fat hogs to San Francisco. There were 90 in the bunch.

Bonnie Belle, grand champion sow at the State Fair, farrowed 11 big healthy pigs Sept. 12. These are by Billiken, and all look like show prospects for next fall.

J. E. Thorpe of Stockton recently donated a Duroc-Jersey boar to the Nevada University Farm, and a prize Chester White boar was given to the Farm by N. H. Locke Co. of Lockeford.

The Mossdale Duroc Farm of Stockton offered a purebred pig to the one who guessed nearest the actual weight of their "heaviest two-year Duroc sow in California" on exhibit at the Fresno Fair.

The Panama-Pacific grand champion Poland China Superba, owned by W. H. Rough of Riverside, is well up on his feet, smooth though thinned down, and has gotten never less than 7 pigs per litter; and an average of over 8. Not many sows were bred to him last season.

C. B. Cunningham of Mills, reports the following sales of O. I. C. swine: One sow pig and a boar to the University Farm. Three boars to Jerry Buckley of Cottonwood; a sow and boar to Geo. M. Frazier; a sow to Mrs. S. R. Cheney of Lindsay; a bred sow to Louis Bidstrup of Suisun; a bred sow to J. H. Stoner of Babbiste.

W. H. Hord & Son will hold on Oct. 12 at their farm near Linden in San Joaquin county, a big auction sale of horses, mules, Berkshire hogs, farm implements and machinery. Included in the sale will be the herd boar Bandmaster 2nd and a number of good registered sows with litters sired by him. Bandmaster 2nd is one of the best known boars on this coast. He was junior champion at Iowa and Minnesota State fairs 1914; and 2nd senior yearling at P. P. I. E. 1915.

Elmer Lamb of Ceres announces in another column that he is selling out all of his fine herd of Duroc Jersey hogs. Mr. Lamb is in ill health and will discontinue work in an effort to regain his old-time vigor. His herd of Durocs is one of the best in the State, numbering among them champions at the P. P. I. E. and State Fair, and all are offered at sacrifice prices. Here is a splendid opportunity for all wanting foundation stock.

BIG LIVESTOCK SHOW AT HANFORD.

Notwithstanding unfavorable weather conditions the Kings County Fair started off the present week with what is admitted to be the strongest livestock show ever assembled at a county fair in California.

Holstein cattle are represented by the best individuals from the Tagus Ranch, T. J. Gilkerson, T. D. Ross, G. A. Clark, C. M. Blowers, L. Y. Montgomery and M. A. Hoppert herds.

Jerseys are being shown by N. H. Locke Co., S. W. Williams, J. E. Thorpe, A. A. Jenkins, C. T. Starr, E. H. Church, R. L. Waltz and Dr. Frank Griffith. The Guernsey showing is being made by E. S. Sattison.

Poland China swine are the outstanding feature in the swine division. M. Bassett, W. Bernstein, H. I. Marsh, W. D. Trehwitt, F. D. Ross and Dr. J. A. Crawshaw having large and strong herds on the grounds. The Spotted Polands

LIVESTOCK DIRECTORY.

REGISTERED AYRSHIRES—All ages for sale. W. J. Domes, McCoy, Oregon.

shown by Dr. Crawshaw are attracting considerable attention.

Fraser and Collins, J. E. Thorpe and the Tagus Ranch are making the Duroc show, while E. H. and H. L. Murphy and A. Smith are again contenders in the Berkshire classes.

Jas. McCord is making a nice showing of Shire horses and jacks while the Percheron showing is largely supported by the Tagus Ranch and M. Bassett.

Chas. Kimble will have his Ramboulllets in the sheep sheds.

The poultry show is strong in numbers, 500 head of chickens, turkeys, ducks, pigeons, geese and pheasants being caged.

Professors Westover and Nelson of the California Polytechnical College are doing the livestock judging.

HIGHLY PRODUCTIVE COWS.

In the past few months the College of Agriculture of the University of California have tested 40 different herds for butterfat production. Among California cows tested with notable results are:

One-year records: Maybel of Linden Home (23,009), 754.83 pounds butterfat, owner, W. H. Dupee, Santee; Proud Dame (38,916), 514.06 pounds butterfat, same owner; Woodland Wilhelmina II (162,538), 739.91 pounds butterfat, owner, A. W. Morris & Sons Corp., Woodland; May Korndyke II (139,370), 621.17 pounds butterfat, same owners; Elmwood Butter Girl (96,038), 614.69 pounds butterfat, same owners.

Seven-day records: Sleepy Barrios of Millbrae (161,752), Millbrae Dairy, Millbrae, 24.707; Gladys of Millbrae (214,830), Millbrae Dairy, Millbrae, 23.492; Whittier De Kol Homestead Rowena (172,014), B. A. Rhoades, Rivera, 23.011; Novelty Pauline II (130,696), B. A. Rhoades, Rivera, 23.429; Johanna Prilly Segis (214,069), B. A. Rhoades, Rivera, 21.215; Gleesome Gaitly Girl II (173,594), R. F. Guerin, Visalia, 21.934.

Thirty-day records: Dioteme Clyde Korndyke, A. Baldwin, Santa Anita, 94.349; Winifred Hotaling II, M. M. Holdridge, Modesto, 94.152.

SWINE.

Poland Chinas.

SMITH'S POLAND-CHINAS—Sows and gilts bred to Joker, First Prize Boar at the Wisconsin State Fair, 1915. These sows and gilts, sired by Iowa Wonder, who is a son of A Wonder, the most celebrated Poland-China boar, living or dead. Litters from this mating are the best I have ever seen anywhere. Prices low quality considered. Will sell one or a carload. As a special inducement each purchaser will be given a year's subscription to the American Swineherd, the best swine paper published and a copy of the Handbook on the Sow; also a copy of the Pig Feeders' Manual. Geo. A. Smith, Corcoran, Cal.

YOUNG POLAND CHINAS, LARGE TYPE—Boar IBA Wonder won first and Reserve Championship. P. P. I. E., weighing 730 pounds under 2 years and in breeding condition. 60-day special—fine young sows bred to IBA Wonder at very low prices; also weanling pigs, either sex. Satisfaction, or money refunded. W. A. Young, Lodi, Cal.

GRAND CHAMPION SUPERBA POLANDS—A few choice spring Superba boars ready for service. Sows bred to Superba for fall litters. Prices reasonably low. Rough's Greenfields, Arlington Station, Riverside, Cal.

POLAND-CHINAS—Bred gilts, \$15; young boars, \$10 and \$15; bred sows, \$25. Weanlings, either sex, \$6. Registered and crated, purchaser to return crates. E. A. Hall, Watsonville, Cal.

REGISTERED POLAND-CHINAS—Prolific, pabulous, profitable porkers. Choice boars now ready for service, \$25 each. Weanlings, \$15. Dr. J. A. Crawshaw, Hanford, Cal.

LAKEIDE STOCK FARM POLAND CHINAS are money-makers. Satisfaction or money refunded. Geo. V. Beckman & Sons, Lodi, Cal.

BIG-TYPE POLAND CHINAS—Stock from the best herds of the Middle West. N. Hauck, Alton, Humboldt Co., Cal.

POLAND CHINAS—Big type. Shoats, either sex, or in unrelated pairs. O. L. Linn, Linview Route A, Modesto, Cal.

POLAND-CHINAS—Big type combined with quality. Choice bred sows, gilts, boars, W. D. Trewitt, Box 82A, Hanford, Cal.

BERKSHIRES—Four service boars, 30 Spring 1916 open gilts for sale. Oak Grove Dairy Farm, Box 1, Woodland, Cal.

REGISTERED POLAND CHINA SWINE—Prize-winners. Finest stock in the State. \$20 up. M. Bassett, Hanford, Cal.

POLAND CHINA HOGS FOR SALE—Registration papers furnished free. C. A. Conley, Durham, Cal.

REGISTERED POLAND-CHINAS and Duroc Jerseys. Cholera immune for life. T. H. Beckman, Lodi, Cal.

GEORGE WATTESON—Breeder registered Herefords. Bishop, Cal.

SHORTHORNS—Carruthers Farms, Mayfield, Cal.

MISCELLANEOUS.

SAN FRANCISCO LIVE-STOCK EXPORT Co., Eugene R. Croley, Manager, solicits foreign orders for purebred registered and merit breeding animals and fowls. California has great diversity of climatic and other conditions that enable us to select animals that have been raised under conditions similar to those of the location for which they are intended. We should be informed regarding these conditions and be allowed ample time to make selections. Nearly all disappointments in buying afar are the result of insufficient information as to conditions or to lack of time for proper selection. Our plan and terms for "raising animals to order" to fit into peculiar foreign conditions is worth investigating. References: Dun or Bradstreet, or San Francisco banks. Office 219 Underwood Building, 525 Market St., San Francisco.

CROLEY'S CALF FEED with skim milk will raise fine dairy heifers cheaply. Geo. H. Croley Co., Inc., 631-637 Brannan St., San Francisco.

D. O. LIVELY, 216 Hobart Building, San Francisco, buys and sells livestock—any kind—any quantity.

DUROCS AND GUERNSEY BULL CALVES Gilts bred to 900-lb. boar. Ed. E. Johnson, Truckee, Cal.

DOGS.

THOROUGHbred SCOTCH COLLIES—All bred from our noted prize-winners. Have a few 3 months old puppies—very choice. Write us what you want. Browndale Kennels, Redwood City, Cal.

BASSETT'S POLAND CHINAS

For many years, at widely separated show rings, under many different judges of varying type ideals, my Poland Chinas have been consistent prize-winners. My herd is large, and I cull closely. The animals sent out as breeders are the very tops of a large number. I KNOW that my kind of Poland China is a profitable farmer's hog, for I send carloads of them to the packer every year—uniform in size, high in quality, quickly and economically matured and finished. Young Stock, \$30 Up. M. BASSETT, R. 1, Hanford, Cal.

SHARPLES SUCTION-FEED CREAM SEPARATOR

\$80,000,000 worth of cream is lost annually, due to turning old-fashioned separators below speed (19 out of 20 farmers turn too slow) Sharples is the **only** separator that will avoid this loss—skims clean at any speed. Over a million users. Made by the oldest and largest separator factory in America.

Bean Straw as a Stock Food.

[Written for Pacific Rural Press.]

With a none too plentifulness of hay and an extra large amount of bean straw available on account of the large bean acreage to be harvested, many stockmen will doubtless substitute large quantities of bean straw for hay this fall. In the large bean-growing districts along the coast, bean straw has been fed more or less extensively for a number of years, the price usually averaging about two dollars a ton in the stack in Ventura county.

In San Luis Obispo county more or less bean straw has been fed to dairy cattle, but experience has shown that excessive feeding of it to milk cows is dangerous because of the slinking of calves which is preva-

lent when cows are so fed. In moderate amounts, however, no bad effects need be expected either with young and dry stock or milking cows. In fact where some hay is fed, both young and dry stock can be carried along very cheaply.

On the Chas. Donlon dairy in Ventura county, bean straw is baled and stacked every year and fed in open feed racks in the corral to all classes of cattle. It is supplemented in the milking barn, however, with alfalfa hay and dried beet pulp, the combination giving excellent results.

Both sheep and beef cattle can be carried along on almost a complete ration of bean straw, but require grain also if fattening is required.

JERSEYS SELL AT A BARGAIN.

The Jersey dispersal sale held at Modesto last week was decidedly a buyers' event, the 61 head of registered cattle that were sold going at bargain prices. Being a dispersal sale, the offering was not as uniform in either age or quality as it might otherwise have been, and the sandwiching in of some rather old cows as well as some extremely young calves undoubtedly affected the average for the females.

Lack of official testing may rightly be attributed to some of the selling trouble at this sale, and this should be borne in mind at future sales. Dairymen as well as breeders who attend purebred sales want more than a registration paper; they want a milk bucket record. Several times dairymen were heard to ask, "What is the record of his dam?" and the inability of auctioneer Col. Ben Rhoades to answer the question caused the loss of another bidder.

Of the 61 head sold 29 were cows that averaged \$104.40. The 23 heifers averaged \$79.75 and 9 bulls averaged \$38.30. Buyers at the sale were J. A. Goodall, Turlock; Geo. T. Davis, Ceres; W. H. Hemenway, Stockton; H. D. James, Modesto; J. R. Phelps, Modesto; Dr. Stellar, Modesto; D. O. Lively, San Francisco; O. C. Glass, M. W. Brady, Modesto; O. C. Loud, Modesto; O. H. DAIRYING WITH POOR COWS.

To the Editor: I would like to know in what proportion to feed the following food to a milk cow to produce the most milk. My cows are in extra good flesh, but will give but little milk. I have well-bred young cows. The second day or so after calving second and fourth calves, they both would not give enough to falfa, oat hay, sugar cane, kaffir feed a calf. I have Sudan grass, alfalfa, grain and fodder of both kinds, and stock beets of which I feed quite heavily. In fact, they have about all they want of all the different kinds of feed I have all the time. I want to make use of the feed I have, as I raise it myself. I will also have pumpkins to feed soon. Please advise me as to the proportion, etc.—E. L. U., Hemet.

[Answered by Prof. F. W. Woll, University Farm, Davis, Cal.]

A cow that will not give more milk than a calf will take is a pretty poor cow, and the chances are that she cannot be fed so as to yield a profit to her owner, even under the best system of feeding. A good dairy cow will produce at least 20 pounds (or about 2½ gallons) of milk a day, on the average for the first, 3 or 4 months after freshening, while a calf will not need more than a gallon a day at first and about 2 gallons a day when old enough to be brought over to a skim milk diet, at 3 to 4 weeks old or before.

E. L. U. has a great variety of feeds to choose from, and should have no difficulty in feeding his cows so that they will give the largest amount of milk that they are able to. I would suggest feeding as much alfalfa hay as they will clean up, with a feed of either Sudan grass or oat hay a day, about 20 to 40 pounds of stock beets, according to the amount on hand, and a few pounds of grain daily. A common rule as to feeding grain when cows receive a good quality of roughage, like alfalfa hay or alfalfa and roots, is to feed a pound of grain for every five or six pounds of milk that the cows produce. Cows that do not yield at least 2 gallons of milk a day on this ration for some months after calving, are not worth keeping. They do not produce enough to pay for their feed, and had better be fattened and sold to the butcher. It is hopeless to try to make the dairy pay with cows of that kind.

A feature of the Rhoades-McAllister Sale was the large number of cows bred to King Segis Pontiac Jannek. There is a standing offer of \$150 for every heifer calf by this bull, at four months of age.

Raising Poultry for Profit

THE VALUE OF CLEANLINESS.

[Written for Pacific Rural Press by Susan Swainsgood, Pomona.]

The lesson of cleanliness is barely understood by even good poultrymen, and poor ones have not an idea on the subject. You can write about cleaning up and spraying until doom's day for all the effect it has on some people, who really think that a chicken and a hog are filthy by nature and just revel and grow fat in filth. Now, there never was a greater mistake made nor one that has cost the farmer more money. Both poultry and hogs do the best they can under the conditions thrust upon them by unthinking people.

It is this accumulated filth that people think chickens like that brings on all the diseases we have. If chickens were kept clean—that is everybody's chickens—there would absolutely be no lice, no mites, no roup, and no chicken pox. Bowel troubles might be with us on account of wrong feeding, but even diseases of this kind would be easily corrected and gotten rid of because the chickens would have more stamina and vigor. I know a person who has raised chickens for twenty years on the same ground; true, he divides it into two plots, and while his chickens are running on one piece of ground he has some kind of a crop coming to maturity on the other, and in that way he keeps his ground clean and wholesome. I know another party who, to save labor and time, takes a long chance and never either spades, plows or harrows the ground his poultry run on, and for over seven years he has let filth accumulate, and laughed at the old "women" who talk about cleaning and spraying. A few days ago I heard he had at least 1000 hens with chicken pox. It has been quite a while in coming home, but it is there and unless he sets about cleaning up in real earnest now he will be laughing on the wrong side of his mouth.

Chicken pox, roup, and canker will decimate a flock more quickly than anything else under the sun, and they nearly always come together. The dry weather is favorable, and this is the time to clean up well, for after the rains set in wherever there is a weakling in the flock it is almost sure to get some or all of these troubles. These things become epidemic; the wind carries the germs great distances, sometimes for miles, before they fall into ground that is fertile for them by reason of filth. Birds, too, carry germs, but if your grounds are clean and your chickens healthy and vigorous they may fall but they will not harm your flock. There must be a breeding ground or germs are harmless, then we can laugh at them.

Just at present the fad is to vaccinate for chicken pox, but a man with a thousand affected will find that a pretty big job. I prefer to take a fine spray and a bucket of good strong dip and go along after they take to the roosts and spray them. Some will get the dip on the head and some on the body feathers,

but in all cases there will be enough of the liquid get in the eyes to cause the birds to wipe their heads on the feathers and in doing so they get more of the dip instead of getting rid of any. This is the easiest and surest way out of such a mess. The birds must be well fed and have a little tonic; not a stimulant, but an iron that will build them up and make them eat. Don't be sparing of the feed, neither in quantity nor quality, if you want fowls to get better quick from chicken pox.

What ails my ducks? Their eyes are sore and all the feathers have come off the head and bill. Is it roup?—Mrs. H. A.

Answering the last question first—no, it is not roup; ducks do not have roup. The loss of feathers and sore eyes are from the lack of depth in your drinking vessels. Ducks require deep drinking vessels in order that they may wash the feed off the head and eyes. If the dishes are shallow the feed bakes and eventually falls off giving the ducks a naked, sore appearance. If you will give them something like a candy pail and keep it filled with water every time they feed, the feathers will soon grow and the eyes be all right. In the meantime grease the bare spots and keep the ducks in a shady place for comfort.

H. V. Brooks purchased from L. Miles the last day of the Modesto fair the first cockerel, first, second and third pullets at the fancy price of \$50.

Two poultry shows will be held in Fresno during the coming winter. Both exhibits will be conducted under the auspices of the Fresno Poultry and Pet Stock Association, which is the fanciers' organization under the Tri-State Poultrymen's Co-operative Association. The first show will be for amateur raisers only and will be held in December. The main exhibit will be staged either in January or February.

Keep Their Houses Clean

Mites and lice breed by the millions these early fall days. Don't let them get a foothold in your growing flock—the birds you expect to lay high-priced eggs this winter. Make their houses bright cheerful and sanitary and prevent the existence of all vermin and disease germs by painting and disinfecting at one operation with

CARBOLA
The Disinfecting White Paint

A snow-white mineral paint combined with the world's most powerful germicide. Rids the premises of vermin, yet cannot harm the birds. Comes in powder form. Mix with water and it is ready to use. Can be put onto any surface with brush or sprayer.

Use It Instead of Whitewash

in poultry houses, dairies, barns, cellars and piggeries. Will not blister, flake or peel. Used and endorsed by experiment stations and many of the largest poultry and dairy farms.

10 lbs. (10 gals.) for \$1 plus postage. 20 lbs. (20 gals.) for \$2 delivered free. 50 lbs. (50 gals.) for \$4 delivered free.

Your dealer will supply you. If not, send us his name and your order. Trial package, enough to cover 250 sq. ft. and booklet "The Disinfectant that Paints" for 25 cents.

GERMAIN SEED & PLANT CO., Distributors, Dept. L., LOS ANGELES, CAL.

Do It Electrically

ELECTRIC APPLIANCES in the household, not only add to the convenience of all members of the family, but they are economical and time-savers.

Mrs. Best's Letter.

My Dear Friends: The shops continue to show new models and styles of all fall garments—the evening coats are quite the most luxurious looking models we have seen in some years. Many of them are made of brocaded silk or satin, others of plush lined with gaily flowered material and elaborately trimmed with fur or fringe. Gold colored silk trimmed in brown fur is one popular combination of color and peacock blue or rose, trimmed in gray or white fur, is another youthful combination. Black is popular for coats and also for evening dresses—not a plain black, but a black net embroidered in sequins or colored beads, made very frilly and having a vivid touch of color somewhere on the waist. Many of the evening dresses for girls have a tight little sleeve about three inches long finished with a frill, which is a very welcome change from the sleeveless dresses of last season.

There is a new rain coat on the market, a combination of silk and rubber, that is developed in all the light pastel shades and is equally attractive for a motor coat in good weather as for a raincoat in the winter.

Blouses continue to be sheer and dainty and are seen in all colors, but at one of the good stores, one of the salesladies confided in me that the really well-dressed women this winter were going to have blouses of crepe to match their suits for street wear. Whether you take up the fad of separate collars for suits, should depend upon their becomingness to you. Do not think you must wear them, for there are many well-dressed women who do not.

In hats, the only new model is the tam-o'-shanter, which is very becoming to youthful faces and can be made at home by a skillful needlewoman. The loose artist's model, I think, is just a fad, but the stiffened tam, either with or without a brim, will probably be good style all winter.

Those of you who have jersey cloth sport suits left over from summer are much in luck, for they are equally good style now—the new models that are coming in for fall wear are almost identical in cloth and cut.

Angora Shetlands are the newest thing in sweaters seen in gay colors, both machine and handmade. The slip-on is also shown but it is a trying style; one must be neither too stout nor too thin to wear it well.

Rosabella Best.

HOUSEHOLD RECIPES.

Frying Doughnuts.—When frying doughnuts, put a teaspoonful of vinegar into the fat and the doughnuts will soak less grease and be light and fluffy.

A Substitute Butter.—Turkey fat, after it has been tried out, is a splendid substitute for butter in making cookies or biscuits.

National Apple Day.—The need for well-varied meals ever confronts the housekeeper and one of the most effective and economical ways of accomplishing that end is to vary the forms of serving a staple food. For

this purpose, apples are an ideal fruit, for they can be sewed in many ways, are easy of digestion and appetizing to all members of the family. Try some of the following recipes, not only on apple day, which is the third Tuesday of October, but other days as well:

New England Apple Sauce.—Pare, core and quarter twelve tart apples of medium size. Put into an earthen jar or deep casserole; add one and one-half cups of sugar and one cup of water. Cover and bake slowly in moderate oven, until a deep red, from two to three hours.

Fresh Apple Custard Pie.—To one pint of apple sauce add one quart of milk, four eggs, one tablespoon cornstarch, pinch of salt, one-fourth grated nutmeg, one tablespoon melted butter, juice and grated rind of one lemon and one cup of sugar and bake with under crust only.

Apple and Quince Preserves.—Pare, core and quarter apples; add a third as many quinces that have been pared, cored and cut into small pieces and boiled until tender. Make a syrup of the water in which the quinces were boiled and as much sugar as there are apples and quinces. Let boil, skim and drop the quinces and apples in and let boil for fifteen minutes; dip out carefully and put into jelly glasses; boil the syrup until it will jelly and pour over the fruit.

Baked Apple Dumplings.—Cut rich pie crust into six-inch squares. In the center of each place a small apple, pared and cored. Fill the apples with sugar, cinnamon and a whole clove. Wet the edges of the pastry with white of egg, fold it over the apple, pinch and flute to look well; bake about forty minutes; toward the last brush the top with white of egg and sprinkle with sugar. Serve with hard sauce.

Persimmon Relish.—Take five pounds large Japanese persimmons ripe enough to eat. Wash and pack in fruit jars, being careful not to bruise. Take two quarts good cider vinegar and boil with three pounds of sugar and a few pieces of stick cinnamon. Let cool and fill jars, seal and set away. In a short time they will be delicious. Serve with roast pork and mutton.

Honey Fruit Cake.—Four eggs, five cups of flour, two cups of honey, one cup of sweet milk, two teaspoonfuls of cream of tartar, one teaspoonful of soda, one pound of raisins, one pound of currants, half a pound of citron, one teaspoonful each of cloves, cinnamon and nutmeg. Bake in a slow oven. This cake will keep a long time.

Cretonne costumes to be used freely for draperies, sofa pillows, shirtwaist box covers, bolsters and scarfs for dressers.

BROWN BETTY.

Butter a deep pudding dish and place a layer of finely chopped apples in the bottom; then add a layer of very fine bread crumbs, sprinkle with sugar and spice; add a little butter, then another layer of apples, and so on until the dish is filled. The top layer should be of crumbs seasoned to taste. Bake in a moderate oven until quite brown, and serve while hot, either with cream or hard sauce.

THE HOME CIRCLE

I JUST KEEP LIVIN' ALONG.

Some folks they keep huntin' for sorrow,
They sigh if they're right or they're wrong;
But this day's as good as tomorrow,
So I just keep livin' along.
I just keep livin' along,
I just keep singin' a song.
There's no use to sigh
While the sun's in the sky.
So I just keep livin' along.

When the Lord made the world, was I in it
To give him directions? He knowed
I wouldn't know how to begin it,
Bein' nothing but dust by the road.

So I just keep livin' along,
And I can't say the Lord's work is wrong.

I never will sigh
While he's running the sky.
I just keep livin' along.

I'm thankful for sun and for showers.

The Lord makes the winter and May,
And he'd hide all the graves with his flowers

If folks didn't weed 'em away.
So I just keep livin' along.
Still thankful for sunlight and song!
I know when it's snowin'
God's roses are growin'.

So I just keep livin' along.
—Frank L. Stanton.

NEW COOKING TERMS.

Here are a few of the best known and most frequently used terms met with in the average recipe:

A la creme—With cream sauce or white sauce.

Au gratin—A scalloped dish, in which cheese is generally used.

Au naturel—According to nature.

Blanc mange—White food, literally.

Blanquettes—A white fricassee.

Canape—A sandwich, small and highly flavored, and used as an appetizer. It is usually served with an under crust (slice of bread or toast or wafer) only.

Casserole—An earthen baking dish.

Croutons—Literally, crusts. Small squares of toast.

Espagnole—A Spanish sauce.

Farci—Stuffed.

Fondue—A dish made of cheese and eggs.

Fanchonettes—Small pies with meringue.

Hollandaise—Dutch white sauce with egg-yolks and lemon.

Knolff—Tiny dumplings of flour.

Krummel Torta—Crumb tart.

Lyonnaise—A sauted dish, seasoned with onions and parsley.

Maitre d'Hotel—Literally, master of the hotel. By the head steward.

Mayonnaise—A sauce originated in the French province of Mayonne.

Meringue—A frosting of beaten white of egg and sugar.

Mousse—A froth.

Parfait—Perfect. A frozen whipped cream mixture.

Pfeffer Neusse—Pepper nuts.

Puree—A soup thick with the mashed pulp of the article used.

Ragout—A highly seasoned meat stew.

Ramekins—Individual baking dishes.

Souffle—Lightened with air.

Tartare—Sharp.

Timbales—Cup-shaped.

Good Health.

(By H. E. Pastor, M. D.)

Country Babies and City Babies.

We are told by the New York Sun that babies born in the slums of New York City are healthier than babies reared in the country, and we presume the same rule holds good relatively in California. This should not be. Mothers should be healthier in the country, and therefore the baby's food supply better, and if cow's milk is used it should be fresher. There are oceans of fresh, sweet air in the country, uncontaminated by a city's smoke, sewers or garbage, and baby should have an abundance of it. It is soothingly quiet in the country, too, which conduces to restful slumber; and next to food nothing is more important to baby's welfare than plenty of undisturbed sleep. Then what is the matter? Wherefore the lower mortality in the city's slums than in the great outdoors of the country, which is Nature's unrivaled sanitarium? It can only be accounted for on the assumption of the city's superior sanitation—the outcome of collective intelligence and action. Let mothers in the rural districts, and fathers too, study the important matters of domestic hygiene and sanitation. Everything naturally favors greater healthfulness in the country, of the adult as well as of the baby. It is the hope of the Rural Press that this preponderance of favorable conditions in the country shall not be lost through ignorance or inattention.

A Few Words about Bones.

The writer of this column was handed a newspaper clipping the other day which bore the sensational caption, "Bowlegs from Baked Spuds," and was asked for an opinion on its merits. Like other specimens of "canned science" so lavishly dished up these days in the daily press, it makes interesting reading for the hoi polloi, but should not be taken too seriously. The article contains a dash of truth, inasmuch as potatoes are a fat-forming rather than a bone-forming food, and a child fed exclusively on potatoes might become physically rickety just as a person whose reading is confined exclusively to the daily press becomes mentally rickety. The simple facts are, as every well-educated person knows, that the bones consist of an animal (or organic) constituent and an earthy constituent, the two being very intimately associated. The organic part forms about one-third and the inorganic about two-thirds of the bony mass, though these proportions vary at the different periods of life, the organic matter preponderating in the infant and the inorganic in the aged. It is not uncommon for children of the poor and ignorant to become rickety through defects of nutrition, as an insufficiency of food, and especially of food containing the proper proportion of mineral salts; and the bones are liable to become bent or curved from the weight of the body. Bowlegs are a common example. The most important salt entering into the formation of bone is phosphate of lime, though carbonate of lime, phosphate of magnesia and common salt (chloride of sodium) are others. Oats, wheat, rye and other cereals

are rich in these salts, and should not be omitted from the dietary of the weaned child, or when the mother's breast is supplemented with artificial feeding. The human milk itself is a perfect food for the human infant. If you are in need of advice in the preparation of food for children or an infant, get it from a physician or an experienced nurse, and not from a penny-a-liner.

The Orange as a Breakfast Fruit.

Stewed prunes, figs, or apples are all in their way wholesome when eaten a half an hour or so before

breakfast. The orange, however, surpasses them all as a pre-breakfast fruit. It is palatable and refreshing, and is one of the best and safest intestinal antiseptics we have. Besides stimulating the appetite, it reduces to a minimum the putrefaction found in the alimentary tract of even healthy people careful of their diet. Grapefruit is an acceptable substitute, containing as it does a tonic bitter principle similar to quinine. Use sugar to taste.

He who loses wealth loses much; he who loses a friend loses more;

but he that loses his courage loses all.—Cervantes.

SUGGESTIONS FOR THE HOME.

Pedestal lamps of wood, enameled in two-tone stripes and surmounted with a large silk shade are very popular.

The newest thing in a piano bench has carved legs and is upholstered in tapestry.

Braided rag rugs almost room size, in oval form are very popular.

Upholstered furniture has brought back in use all the old-fashioned guimps for furnishing.

26 Extra Features
73 New Conceptions

Mitchell
MID-YEAR
MODEL

20% Extra Value
Due to Factory Efficiency

20% Extra Value

Due to John W. Bate, the Efficiency Engineer

We intend that the Mitchell shall offer 20 per cent greater value than a like price can buy elsewhere.

We save at least that in this factory. It was built and equipped by John W. Bate to minimize every cost. It has reduced our making cost one-half. It has given us an advantage of 20 per cent, we believe, under any rival Six.

90% In the Chassis

About 90 per cent of this extra value goes into this Bate-built chassis. It goes largely into extra strength. There are 440 parts which are drop-forged or steel-stamped—three times as strong as castings.

The major strains are met by Chrome-Vanadium steel, costing up to 15 cents per pound. To every part is given at least 50 per cent over-strength. The rear springs are Bate cantilevers, not one of which has ever broken.

We include a power tire pump, an extra-cost carburetor, a ball-bearing steering gear, an easy type of control.

There are in this car 26 extra features which other cars omit. And those extras will cost us about \$2,000,000 on this season's output alone.

Aims at 200,000 Miles

Mr. Bate has aimed at a lifetime car. Two of his Mitchells have already run over 200,000 miles each.

That's forty years of ordinary service. Seven of them have averaged about 175,000 miles each.

See what Mr. Bate's genius has done for the Mitchell. His improvements number more than 700. See what his efficiency gives you in extra values. A half-hour spent with a Mitchell dealer will win you to Bate-built cars.

A Many-Year Decision

The decision you make on a fine car now will affect you for many years. If you get the right car, you may never need to buy another. If you buy the wrong car you are likely to change before long.

Don't judge by demonstrations only. All new cars run well. Go into the hidden facts. Get the records on endurance. Above all else, judge by the man who builds it.

Go deep enough, and you are bound to choose the Mitchell. Many noted engineers have done so in buying cars for themselves. Your Mitchell dealer will show you a list of them.

You will get in addition the most complete car that's built. In the Mid-Year Mitchell you will get 73 new conceptions. Our designers examined 257 of this year's models before completing this one.

Ask us the name of the nearest Mitchell dealer, if you do not know him. For your own sake, see the car he has.

TOWER'S FISH BRAND

everything about a rainy day seems to say to keep dry, to work in comfort wear the **FISH BRAND REFLEX SLICKER \$3.**

A.J. Tower Co - BOSTON

Floral Department.

[By Geo. N. Tyler.]

Cyclamen.—About the first of October is the time to sow the seeds of cyclamen for next winter's blooming. Sow in boxes or pans of finely prepared compost, prepared as follows: One part loam, two parts leaf-mould and one part sharp sand or fine gravel. Press the soil firmly on top and sow the seeds one inch apart each way. Cover with a light layer of leaf-mould and sand in equal parts to the depth of one-eighth inch, put the boxes in the shade where the temperature is about fifty degrees, and water thoroughly, but be careful in watering not to wash the seed. Use a very fine spray. It takes about four weeks for cyclamen seed to germinate. Sow a good strain of seed, the best you can buy, if you want good results.

Pansies that were sown in August are now ready to be boxed off. Fill flats with three inches of finely prepared soil, and prick out the little seedlings and plant them two inches apart both ways. The correct way to plant them is to use a dibble or pointed stick about eight inches long and about the size of a lead pencil. Make a round hole with the dibble and prick out and plant one seedling at a time. If you prick out more the delicate roots will dry up if exposed to the air for any length of time. In planting the seedlings do not let the roots hang in a little cavity and firm the soil on top, but use the dibble and work the soil around the roots. Never mind the top—when you water with a fine spray the top will level off all right, and be sure and water as soon as you fill up the flat with plants.

After watering put the flat away in the shade for about five days, and then give full sun—but never let them dry out at the root.

Tuberous Rooted Begonias that were started early should now be put outside in the shade, in a sheltered place, and gradually dried off. After the foliage turns yellow put them out in the sun and dry them off entirely. After the stems drop from the pots, put the pots, bulbs and all away in the cellar, or where they won't freeze for the winter.

Cuttings.—You can put in all kinds of cuttings now; geraniums of all kinds root very easily. Sow all the seeds you can for next spring's blooming—those that are hardy.

HOUSEHOLD HINTS.

When your stocking feet are past mending, cut off the legs for bags to put over the broom when wiping walls or cut in strips and fasten to a mop handle for a dry mop.

If corks are too large for the mouth of the bottles for which they are intended, soak them in boiling water for a short time and they will soften so they can be pressed into the bottles.

It cannot be said too often that sand or flour sprinkled over burning grease or oil will put out the fire.

To prevent white silk handkerchiefs from turning yellow in washing, do not boil nor rub soap directly upon them. Use a lather of good white soap and then rinse thoroughly and iron while they are still damp.

For sink shelves and the kitchen

table, nothing is better for a bleach than lemons.

Anastigmatic and Autographic

\$27.50

The 3A KODAK

Has the autographic feature whereby you can date and title your films at the time of exposure, is fitted with the new Kodak Anastigmat f.7.7 lens—a lens that leaves nothing to be desired in definition (sharpness) and flatness of field and has more speed than even the best of the Rapid Rectilinear lenses.

The shutter is the Kodak Ball Bearing with instantaneous speeds of 1-25, 1-50 and 1-100 of a second and, of course, the usual time and "bulb" actions. High grade in every detail.

RACINE HORSE SHOE TIRES

COST LESS

Racine Horse Shoe Tires are making sensational records of actual mileage service, although they sell for less than other good tires. This is due to the many distinctive features of the tires. Drastic road and factory tests have proved absolutely that they survive the most abusive wear and tear, withstanding the ceaseless attacks of the worst roads long after tires of lower quality have been ruined by the same conditions. Our special tire folder gives interesting facts. Write for it.

SAN FRANCISCO.

San Francisco, Oct. 4, 1915.

Wheat.

Reports of shortage in various parts of the world have caused further advances in Eastern and Northern markets, resulting in another sharp advance here, making prices the highest in long time. Local business is mostly of jobbing nature, trading has been fairly active.

[f. o. b. San Francisco.]

Milo Maize Nominal
Egyptian, new 1.80@1.85

Beans.

Weather is the determining factor in the bean market just now, recent rains have caused a much firmer feeling, especially as they have not been followed by drying weather. Damage has undoubtedly been extensive, but reports are too conflicting to warrant any conclusion as to real loss for several days. The outlook for large whites is not very encouraging at present, buyers are anxious to take on supplies, causing further advance; but not certain that the firmness will continue. Blackeyes have stiffened up a little, other varieties are easier.

[On wharf, San Francisco.]

Bur clover, re-cleaned 10½ c

Hay.

Some hay still in the fields has undoubtedly been lost, or at least made unmarketable by the rain; according to some reports the amount was considerable, though it is too early to know definitely. Difficulty of getting cars has tended to keep a great deal of hay in the fields, but storage facilities have been provided for much of it. The stiffening tendency of such losses will be partly nullified by the early supply of green feed; though better grades of hay will no doubt be quite firm. Locally supplies continue light, except for alfalfa, which is offered freely, though the outlook for another cutting is poor. Values are pretty well maintained on alfalfa as well as grain hay.

Deciduous Fruits.

The market is narrowing down a little, plums being cleaned up, peaches and figs will soon be out. Pomegranates are offered in considerable quantity around \$1 per lug box, persimmons are lower on larger receipts. Oregon cranberries easier, some Cape Cod stock is offered at the appearing figures, with good demand. Apples steady here, but shipping business is slow, owing to lack of export facilities, speculators are not taking hold. Accordingly many carloads are being stored by packers. A few winter Nellis pears are appearing. Figs higher, with little good stock appearing. The market has been swamped with Turlock cantaloupes, but shipments have been shut off. Watermelons higher. Good grapes scarce and very firm, with buyers much in evidence. The rain has so curtailed the supply that shippers are having difficulty in meeting their contracts, the amount stored in barrels is likely to be limited.

Dried Fruits.

No further price changes noted, but local packers describe the market as firm and active, with lively demand for practically all kinds of fruit from all large consuming markets. Buyers are making liberal provision for their holiday requirements, in many cases covering for entire season, feeling that prices are likely to go up rather than down, and that a large consuming demand is assured. Prices now offered appear satisfactory to most of growers, many of whom are cleaning up their crops. Apples are moving fairly well at recent advance. Apricots are practically out of first hands, most of the figs also under contract. Growers are now generally admitted to be in control of the prune situation, heavy purchases are being made at present range. Small sizes are very scarce, and are getting a premium over large, some sellers having offered to buy back contracts for such goods at an advance. Packers who sold short are said to have lost heavily.

[Net to growers, bulk basis, f. o. b. shipping point.]

Special Deciduous Market Report.

By J. L. Nagle.

Sacramento, Cal., October 3, 1916.

The rain that started Saturday has wet down the grape districts to such an extent that picking and packing are temporarily delayed. Some damage has already been done but to what extent cannot at the present time be estimated. If the unfavorable weather continues, the packing of grapes in drums will be affected considerably.

About 70 per cent of the first crop of Tokays has been harvested and the second crop which has developed into fair quality and size, will be ready for harvesting in about a week.

Malagas are getting soft account of being over ripe and shipments of this latter variety will probably be very

light from now on and the season will probably close within the next two weeks. All markets on good stock show an active demand at profitable prices. The following prices have ruled for the week:

New York.—Tokay grapes averaged \$1.31; Malaga, \$1.15; Cornichon, \$1.25; E. Hardy pears, \$2.38; Levi peaches, 95c.

Boston.—Tokay grapes, \$1.50; Malaga 97c; Cornichon \$1.27.

Chicago.—Malaga grapes, \$1.10; Tokay \$1.20; Muscat 88c; Cornichon \$1.47.

Total shipments to Oct. 3, 1916 5 cars; total shipments same date 1915, 11805 cars.

LOS ANGELES.

Los Angeles, Oct. 3, 1916.

Butter.

Receipts California by rail for week ending Tuesday, October 3:

1916289,900 lbs.
1915289,120 lbs.

Firmness continues to characterize this market. In sympathy with strong markets east, moderate receipts and a steady and fair consumptive demand prices held up well throughout the week and the arrivals were well taken care of. Following the rain the market Tuesday showed weakness, though was not quotably lower:

California extra creamery32c
California prime first31c
California first30c

Daily quotation on 'Change:

	1916	Wed.	Thu.	Fri.	Sat.	Mon.	Tu.
191632	33	32	32	32	32	32
191526	26	26	26	26	26	26

Eggs.

Receipts by rail as reported to the Produce Exchange for week ending Tuesday, October 3:

19161088 cases
1915 870 cases

There was an absence of speculative life in this market the past week—light receipts caused trading to hold back and go slow. The consumptive demand, however, was sufficiently strong to take care of the arrivals and uphold prices under the influence of strong markets east and light production.

Fresh ranch case count

Pullets36
---------	---------

Daily quotations on 'change:

Alfalfa, local15.00@16.00
Straw 7.00@ 7.50

Citrus Market Report

Los Angeles, Oct. 2, 1916.

Shipments of oranges from November 1, 1915, to October 1, 1916, 30,530 cars of oranges and 6,669 cars of lemons. Same time last season 32,279 cars of oranges and 6,535 cars lemons. These figures show a falling off in the shipment of oranges this season of 1779 cars of oranges, but an increase in the shipment of lemons of 134 cars.

It is getting late in the season and the markets in the Central West and East are being crowded with late peaches and pears and this is the height of the apple season and all are selling cheap. Hence a slow and weak market for oranges, and the first part of our review week both oranges and lemons were lower. For the past few days there has been a better tone to the orange market. The weather, however, is against lemons, which are both draggy and sharply lower. Local packers are only bidding 1½ to 2c or 88c to \$1.20 per box in the grove, against 2 to 4c per pound or \$1.10 to \$2.40 per box in the grove a week ago. Oranges were bid for at 2 to 3½c per pound or \$1.00 to \$1.95 per box in the grove. Grapefruit was bid for at 2 to 4c per pound or \$1.00 to \$2.20 per box in the grove. Reports from Tulare county say that the outlook for the early orange crop is very encouraging. The fruit is fine and yield promises 25 per cent larger than last year.

New York, Sept. 26.—Sold 14 cars Valencia, 2 cars mixed and 2 cars lemons. Valencia steady in 200s and easier on 176s and larger. Lemons decidedly lower. Weather fair. Valencia sold from \$2.00 to \$5.20. Lemons sold from \$3.25 to \$4.35. Grapefruit, \$1.40 to \$2.50.

Boston, Sept. 26.—Four cars sold. Market doing better on oranges; unchanged on lemons. Valencia \$3.80 to \$5.00. Lemons \$4.00 to \$4.70. Philadelphia, Sept. 26.—Seven cars sold. Market lower on oranges but

unchanged on lemons. Valencias \$2.20 to \$4.90; lemons \$3.65 to \$4.80.
New York, Sept. 28.—Seven cars Valencias sold and 1 car lemons. Valencias \$1.75 to \$5.75; lemons \$1.30 to \$3.15.
Boston, Sept. 28.—Five cars sold. Oranges unchanged. Lemons doing better. Valencias \$3.50 to \$4.30; lemons \$4.25 to \$4.80.

Philadelphia, Sept. 28.—Three cars sold. Oranges lower. Valencias \$3.20 to \$4.00.
New York, Oct. 2.—Sold 17 cars Valencias, 2 cars lemons, car of grapefruit and 1 car mixed. Oranges doing better, especially on small sizes. Lemons higher. Weather fair. Valencias \$2.55 to \$6.00. Grapefruit \$1.80 to \$2.15. Lemons \$2.80 to \$4.30.

Special Livestock Market Report.

San Francisco, Oct. 4.

CATTLE in Nevada and Northern California are about 80 per cent feeders this year, only 20 per cent being ready to turn in for beef, on account of poor grass conditions. This large number of feeders will be fat in 60 to 90 days. Generally about 60 per cent of Nevada cattle are good for beef at roundup time.

HOGS in the east have been dropping 10 to 30 cents per day from their recent high price. This marks down the local price slightly, because the East takes our surplus cuts.

LAMBS and sheep are coming to the Western Meat Co. from their feed yards at Galt, except for a shipment of 1200 from the Klamath Lake region. Wethers dropped slightly this week.

WOOL remains the same, no signs of lifting the embargo on Australian pelts or wool.

Prices paid for stock, live weight, off cars, without feed or water, at Stock Yards, South S. F.]

Spring Lambs, f. o. b.	
country points\$5.25 @ 5.75

North Portland, Ore., Oct. 2, 1916.

CATTLE.—Cattle supplies for Monday were rather liberal, over 1600 head were received. The market was steady in most cases. Steers sold at \$7.00 for tops and cows at \$5.50. Feeder demand was excellent, buyers from Oregon, Idaho, Washington and Montana being here in numbers. Butcher stock went steady at last week's prices.

HOGS.—Hog receipts were again light, only 1600 being in sight for the early trading Monday. Prices were steady to weaker. Ten-ten was the top sale with bulk around \$9.00. Demand was fair.

SHEEP.—Sheep prices were strong in all lines and lambs showed an advance to \$8.75. Receipts were not heavy.

Los Angeles, Oct. 3, 1916.

CATTLE.—There was no especial life to this market the past week. The offerings were not heavy and killers took good steers coming in at steady prices. Fat cows also met with fair demand. California and Nevada furnished most of the supply and were fair grass cattle for this time of year. Quotations are f. o. b. Los Angeles:

Beef steers, prime, 1000 to 1100 lbs.\$7.00@7.75
Stockers and feeders5.50@6.00
Prime cows and heifers6.25@6.50
Good cows and heifers6.00@6.25
SHEEP.—No change to note in this market since last week. Heavy sheep continue scarce and in good demand. Yearlings and lambs are being had in fair numbers from Arizona and Utah and selling in a fair way at quotations. We quote per head f. o. b. Los Angeles:	
Prime wethers\$7.00@7.25
Prime ewes6.50@6.75
Yearlings6.50@7.00
Lambs6.50@7.00
CALVES.—Not many coming in and demand good and market firm. Selling at \$8.50@9.50 per cwt.	
HOGS.—A steady and firm market was had the past week at the recent advance. There was no urgent demand, however, as the fresh meat trade is quick. California gave most of the supply and some very good hogs. Idaho hogs are still being drawn east by the high markets there. Heavy, averaging 250@300 lbs.	
\$8.50@9.00

Publisher's Department.

To several hundred of our subscribers—just a few words: We don't like to write "dunning" articles in this department, and won't, but we wish to explain our position, which we believe will be all that is necessary. The large part of our subscription list is in a very satisfactory paid-in-advance condition, but a comparatively few are nearly a year in arrears and from these we must collect or remove from our list. The postal authorities say that we can not extend credit on subscriptions over one year, the Audit Bureau of Circulations says it will not count a name on our list over one year in arrears and lastly the price of paper is so high that we can not afford to send the Rural Press to anyone who is not a paying subscriber. Before January 1st next every name on our list who is delinquent will be cut off—we want very much to send your paper to you the coming year. Send us your dollar as quickly as you sell your crop.

"The Sept. 23d edition of the Rural Press failed to come. Will you kindly send a copy. I would like it particularly to get the first article on 'Live Stock Facts and Fancies.' No. II alone was worth a year's subscription, in encouragement. Hoping that you will be spared to write another 46 years for the P. R. P. and that I shall be in the ring to read and act, is the sincere wish of—Geo. F. Warren."

From the comments we have received upon the series of live stock articles he is writing, Prof. Wickson has struck a popular chord, or in stock parlance, a "bull's eye."

Fruit growers who can should attend the annual meeting of the California Nurserymen's Association, to be held at Santa Barbara, Oct. 26 to 28, inclusive.

Two hundred and twenty-six new subscribers were added to our list the past week.

If the Rural Press is a little late this week in reaching our subscribers, lay it to the lateness of the arrival of the white paper from the mill. Not only are Coast papers hard pressed to secure stock, but the East is likewise short. Here is a paragraph taken from a letter written by a farm paper publisher in Wisconsin: "The paper manufacturers are not anxious to make new contracts. All sorts of paper is up from 50 to 100 per cent, with sometimes none in the market."

ANOTHER VICTORY

AT THE Puente California Demonstration, September 19-23, the **BATES STEEL MULE** did better plowing, pulled heavier loads and demonstrated greater flexibility than any other tractor, selling for less than \$2000.

A Whale for Work

Willys KNIGHT

Sleeve-Valve Motor

- ❑ When it comes to pulling long hard hills with twisting, turning country roads—
- ❑ When it comes down to real work, day in and day out, month after month, year after year—
- ❑ The Willys-Knight is the one type of motor that can stand up and deliver—never weakening but getting stronger all the time.
- ❑ It's the sleeve-valve motor—the Willys-Knight motor—a whale for work—and always at it.
- ❑ Carbon doesn't hurt it—valves can't get out of adjustment—so you say good-bye to the two chief causes of motor layups, when you get a Willys-Knight.
- ❑ It will pile up thousands upon thousands of miles more running than you can get out of any other type of motor.
- ❑ And the last miles will be better than the first.
- ❑ The motor almost never needs go to the shop—
- ❑ That's a vital advantage to the man who doesn't live on a paved street next door to the garage.
- ❑ Besides all the tremendous advantages of the Willys-Knight motor for everyday work in any kind of weather on every kind of road, the Willys-Knight has everything else you could ask in a strictly up-to-date motor car.
- ❑ Style—beauty—
- ❑ Comfort—conveniences.
- ❑ Is there any doubt in your mind about what car belongs on the farm? There's only one answer—
- ❑ It's the Willys-Knight—the beautiful car with the work-motor.
- ❑ See the Overland dealer—he'll show you the simple mechanical reasons for the greater power, durability and economy of the Willys-Knight motor.
- ❑ Get right down to business with him—go to the bottom of this motor question—get a Willys-Knight and know the satisfaction no other motor car can give you.

Catalogue on request. Please address Department 503

Fitting Potatoes to Raw Land.

Healthier potatoes and more that are marketable per acre, are much needed in California. Pacific Rural Press hopes to encourage this, not only by printing such cultural experiences as Mr. Peters', but also by noting the success of those who grow seed potatoes certified under the State law.

[Written for Pacific Rural Press.]

POTATO with George Peters, of Kern county, is a good deal like a trick horse—you can teach it to do all kinds of stunts if you study its disposition. But with potatoes, as with the horse, you can spoil a lot of good work by some foolish misstep.

Few potato growers have had to watch each step closer than Mr. Peters; for he has had to pioneer the way on raw land in a country where potato culture on a commercial scale was uncommon. Even now with four years' experience, problems continue to present themselves in which no one has had experience, thus necessitating slow and careful experimenting.

The high, dry, sandy loam soil on which the Peters farm is situated presented a mass of seemingly insurmountable obstacles. Its agricultural possibilities were unknown, because it had been uncultivated. Experience since has shown that its chief requirement is water; and this is furnished in abundance by electrically driven pumps.

Soil and moisture are without question fundamental in potato raising; but so also are seed and culture; and in this case both of the latter have had to be fitted to the soil and moisture conditions.

Good Crops Always.—To simply grow a fair crop, or for that matter a large crop, this year is not a constructive way to grow potatoes in Mr. Peters' mind. The more important consideration is, how to grow a larger crop next year?

The answer to the last question is crop rotation and seed selection. And particular emphasis is placed on seed selection, for not only should each succeeding year's crop be bigger, but it should also contain a smaller percentage of unmarketable potatoes.

American Wonder is the variety grown as best suited to Kern county conditions; and the object from the beginning has been to grow a uniform type rather than an extremely large one.

Perfect Seed.—A potato to score perfection on this ranch should be smooth, shallow-eyed, of good average size and square sides and ends; also it must come from a hill which has yielded five or more good-sized tubers of proper shape.

The process of securing such seed is slow, and especially is this true in the early stages of tuber improvement, on account of the relatively small percentage of hills in a field that yield the required quantity and quality of seed.

The selection naturally commences in the field at digging time. Here the potatoes that are true to type and from vines that have yielded the required amount, are put into separate sacks. With the fall-grown crop, this digging is sometimes done as late as January; for the tubers im-

prove in brittleness when left in the ground.

Rests Seed.—Early in March this seed is put into cold storage to keep it from undue rotting or sprouting; also because experience has shown that giving seed a rest is beneficial. March-stored seed is taken out in August for fall planting.

In this manner seed harvested in fall or winter is never used for the following spring planting, neither is spring grown seed ever used for following fall planting.

What the actual results have been from this system of seed selection and storing is shown by a field entirely planted with such seed last year. From a total yield of 600 sacks but 20 were of unmarketable size. Not only in quality but in quantity has the result been apparent, the yield

from a field where 160 sacks of purchased seed was planted producing on the average 90 sacks of marketable tubers, while a field directly adjacent, planted with home selected seed, produced 150 marketable sacks to the acre.

There is still the opportunity for closer selection and that is what will be done. Then, instead of field selection alone being done, another selection will be made before storing. This time the field selected tubers will be carefully graded at the packing shed and only the best selected for seed.

Small Seed.—All of this leads one to ask, are small potatoes never planted? In the past they have been and where the grower knows their history it seems perfectly practicable to use them, provided they were grown from good seed.

This is on the theory that a small potato grown from good seed and out of a hill containing five or more properly shaped tubers, is inferior because of lack of moisture or some other physical condition of the soil and not because of inferior parentage. Thus it has been found that the first crop from the small seed is usually satisfactory, but the continued planting of the small seed would gradually run both the yield and the percentage of marketable potatoes down.

Rotation Benefits.—So much for the seed and its selection. Culturally speaking, the work on this ranch is almost continuous, for as before stated there are two crops a year to prepare, care for and market.

Just here it is pertinent to record that potatoes are never grown longer than one year on the same soil. This is essential in order to safeguard against disease and maintain uniform yield. Barley and oats have been the rotation crops used after spuds, barley the first year and oats the second. A

bean crop of some kind would be better the second year because it leaves the ground in finer tilth and fertility for potato planting.

The best crop of spring potatoes that has ever been harvested on the ranch followed a planting of rye in August, which was plowed under in December and then disked lengthwise and crosswise of the field and allowed to stand till February.

Spring Crop.—The spring crop has always been planted as near February 10 as possible, after thorough plowing and harrowing of the soil; but in the future earlier planting will be practiced, as frost danger does not seem to be a factor in this location.

Carson Valley a Land of Plenty

[Written for Pacific Rural Press by Bert S. Wolf.]

Beautiful and rich is Carson Valley, Nevada. Beautiful because it is rich in grain and hay; rich because it has the soil, and above all, because it is full of the most progressive and energetic farmers.

Sixty-five years ago Mormon settlers camped in Carson Valley; and the first house built in Nevada was in this Valley at Genoa, which was the first territorial capital of the State, then belonging to the territory of Utah. Land was soon appropriated around the river and foothills, as it abounded with natural grasses for hay and afforded feed for stock. In those days irrigation was unknown; but in 1858 H. H. Springmeyer demonstrated that where sage brush then stood, good crops could be grown, if water was used. After 1860, irrigation was started from small mountain streams and from the east fork of the Carson river. At this time this was mostly used for garden patches. The original water rights are still being held by the children of the early settlers and some of the pioneers are still living. Some years ago a reservoir was built in the mountain. This, however, only supplies a portion of the valley, which is over 20 miles long and more than six miles wide.

This year you will find crops of

grain and alfalfa that makes one long to own some of this land. Alfalfa hay, wheat, and barley are the principal crops. Lots of cattle and hogs are owned by these farmers, and a great deal of dairying is done. The valley is being populated fast and is probably the richest community in the State. Almost every farmer has his automobile and some of the early settlers that started with almost nothing are wealthy men today. Very few farmers own less than 140 acres and from that on up to thousands of acres. Carson Valley has two flour mills, one of these is owned by the farmers themselves. These mills take all the select wheat grown in this valley. Until eight years ago, no railroad came within 18 miles of this valley, and farmers were compelled to haul to Carson City, but that is a thing of the past. Gardnerville is the principal town in this valley, with Minden the county seat one mile distant. There are still thousands of acres undeveloped in Carson Valley, thriving with sagebrush. There has been talk for some time of the government building a large reservoir in the Alpine range and farmers of this valley are looking forward to a wonderful development if this project goes through. It is to be hoped that they will not have to wait long.

Fitting Potatoes to Raw Land.

(Continued from first page.)

Deep planting is the rule, both in spring and fall, seven to eight inches being the preferred distance. This overcomes the tuber moth and keeps the seed in moist soil while sprouting. As a further protection against tuber moth all vines are raked and burned directly after digging and the ground again gone over for possible tubers that the diggers have left buried.

Before planting the seed is immersed in a solution of corrosive sublimate, four ounces to 35 gallons of water, for an hour and a half as a protection against scab and Rhizoctonia, a fungus which would otherwise do great damage to the market qualifications of the main crop.

Irrigation of the spring-planted crop is not necessary till April 1, after which time they are usually irrigated three times before digging, which comes between June 1 and 15.

Fall Crop. — After thoroughly cleaning the field of vines and other debris from the spring crop, the land is irrigated, plowed, and harrowed, and again irrigated just before the fall planting is done August 1. Planting this time follows directly after the seed is cut, otherwise it quickly dries and does not sprout so readily. In cutting both the fall and spring-sown seed, the pieces are cut down to two eyes.

The late crop is not irrigated till the plants are above ground, but after that they are irrigated regularly whenever moisture conditions seem to warrant. On the average four irrigations are given before the tubers are fully matured, a large enough stream being used in each

instance to rush the water through the rows quickly.

Always the spring crop has been the larger of the two, a fair average of the early crop being 125 sacks, while the later one is usually a third less. Not a large crop, compared with those grown in districts with more favorable soil and moisture conditions, it is true, but the most profitable yield that has so far been raised in Kern county.

MANURE OR COMMERCIAL FERTILIZER?

To the Editor: I have a chance to buy some manure. How much is it worth as compared with commercial fertilizers?—W. E. B., Morganhill.

In addition to its fertilizer elements, manure is of value to add humus to all soils where there is water enough to allow it to decay; and to loosen heavy soils with its fiber. The Ohio Experiment Station reports tests which show that, at prices of fertilizers before the European war, \$2 worth of nitrate of soda, superphosphate, and muriate of potash, mixed in such proportions as to contain less ammonia and potash and more of phosphoric acid than are found in manure, would produce considerably better effect than a ton of manure. This depends largely on deficiencies of the particular soil and needs of particular crops. Barnyard manure averages approximately 10 pounds each of ammonia and potash, and 5 or 6 pounds of phosphoric acid per ton.

Practically all the beans in the Goleta valley are cut.

Growing Limas in Ventura County.

[Written for Pacific Rural Press.]

To Californians, Ventura county and lima beans are synonyms. Not because all of Ventura county is a riotous patch of bean vines but because no other one county in the State grows them in such quantities, both in acreage and in yield per acre.

Nor is this yield and acreage liable to be reduced by future bean culture if the experience of Edmund W. Geary, a pioneer grower and the authority for the statements in this article, is any criterion.

The Geary farm of 60 acres has been continuously cropped to limas for 32 years, first by Mr. Geary's father and in later years by himself, and during that time the yield has almost doubled, largely due, he thinks, to improved methods of cultivation, but at least showing no damage from overcropping as would grain or other summer grown crops.

As is so often the case in recording farm operations, one is compelled to begin the story of Mr. Geary's bean crop at harvesting time in the fall. Not because of seed selection, although that is practiced to some extent by setting aside the beans from those patches in the field which have yielded best, as they come from the threshing machine, but because of the value of dry plowing the land as soon as possible after threshing is completed.

Tractors Help.—Until the advent of the tractor, fall plowing of bean land was by no means general owing to the comparatively short time between harvesting and early rains. Horse power could not successfully cope with the race against time, but the tractor with its steady plodding solves the problem if intelligently managed.

This to Mr. Geary's mind is one of the most important improvements that has developed in bean growing in recent years, as it allows the land to lie in fallow during the entire winter and makes seed bed preparation in the spring less of a problem. Anything that tends to improve the physical condition of the soil at planting time is a big step forward.

Garden seed condition is Mr. Geary's manner of describing the ideal seed bed for spring planting which is done between April 1 and June 1, according to seasonal and soil conditions, but generally nearer May 1 than either of the other dates.

If the land has been dry plowed spring plowing is not necessary, but thorough working with clod masher, cyclone, chisel and spring-toothed harrow and crosskill cultivators is done. The clod masher is almost continuously used on adobe soils, directly behind each tool, in order to retard moisture evaporation.

Bag selection of seed is generally practiced, but field selection would be an improvement and will come in the future. The object in picking seed is not to select the largest beans but the most perfect. Seed grown on irrigated land is not so desirable as that grown on dry land, and it is generally considered good practice to buy seed grown in other districts once in a while.

Planting is done with a special bean planter that plants four rows at a time. The seed should be planted

in at least an inch of moist soil, four or five inches being the preferred depth.

Unless spring showers come before the plants are above the ground cultivation is not started till the plants form a well-defined row. If showers do occur the field is run over with a harrow.

The cultivators are made especially for bean work, running through two rows at a time. Unless he irrigates during the growing season, Mr. Geary only has to cultivate once, but on land infested with morning glory the cultivators are kept continuously at work as long as the vine growth will permit. Hoeing is also necessary in order to kill the weeds missed by the cultivator. As an indication of the difference in cost of culture per acre on morning glory land and on that which is clean, Mr. Geary has found that seed, cultivation and harvesting on his ranch averages \$25 an acre, while a friend who farms adobe infested with morning glory, averages \$40 an acre for the same work.

Irrigation in seasons of short rainfall is the rule with Mr. Geary, water in his case being supplied from a pumping plant, but often from artesian wells and gravity systems in other districts.

June 15 to July 15 is the usual time for applying water on this ranch, furrows carrying the water between the rows, often as long as 24 hours in order that the ground may be well saturated. On this matter of thorough irrigation Mr. Geary attaches much importance, for it is his observation that without thorough soaking of the soil at this time, the vines suffer from lack of moisture before maturity of the beans. To accomplish this the water is not run in every furrow at the same time but instead in every other row.

In harvesting the vines are cut when the beans have reached a marketable size, rather than when completely ripe. This safeguards excessive shelling out before harvesting time.

Vine cutting is done with a special bean-cutting sled, having knives attached which cut the vine underground. These knives are run on the cultivator pan, which has previously formed, when possible, as the vines are cut much more effectively in such cases than when they run through soft dirt. On this account several horses are usually used on the vine cutter.

These cutters pile the vines in windrows from which they are later hand stacked into shocks and allowed to cure from 10 days to three weeks, according to the weather. Further away from the coast they are ready to thresh before that time as the weather is warmer.

The last operation on the Geary ranch with the harvested crop is the distributing of the threshed bean straw over the land before dry plowing. Two dollars a ton in the stack can be secured for this, to be used as livestock feed, but Mr. Geary has always considered it worth more than that to his soil, especially when it can be plowed under in the fall and rotted by the winter rains.

FIVE STANDARD

SUB-SOIL PLOW

KILLEFER
QUALITY

KILLEFER
EFFICIENCY

This is one of the line of Deep Tillage Tools shown at the Tractor Demonstration at Puento, Cal.

Every report which we have been able to obtain of subsoil work done during this past fall, has shown extra large gains in crop returns. Our offer of last year still holds good—to give a subsoil plow to any rancher having 500 or more acres for one-half of the increase in crops, for one season only. If we have nerve enough to risk \$300.00 to \$600.00 on this work, what is there in it for you?

WEATHER WONDERS.

LAST week we told how Lloyds lost \$25,000 in weather-insurance by a storm which caromed down from the north, unbeknownst to the observers. This week they could have lost it again by another storm which ricocheted up from the south against all rational expectation. The last word of wisdom in both these, and all other similar phenomena, must be that you cannot almost always tell. There have been considerable losses, by injuries to ungathered fall products, which call for sincere sympathy from those who had not anything to lose, and must be bravely met by the losers with the hopeful outcry: "We will strike it better next time." There may be a few who should chide themselves with the reflection that they might have hastened more to get their perishables under cover, but, as a rule, such losses could neither have been foreseen nor averted and must be charged to "farmer's luck"—a form of adversity which has had much to do with keeping our food producers from becoming too soft in their heads and hearts. A man who is beaten by his luck generally brings up in the penitentiary or the lunatic asylum, or becomes errand-boy for his wife's superior energy and industry. But, really, this autumn's embarkation in the weather business is a wonder—the south coast soaking wet when it is normally dry; the north coast but showery when it is normally soaked; the interior valley, both north and south, wet when there should be but slight breaks in continuous sunshine. It looks as though the coming year would be great and in which the exhortation to the California farmer should be: "Trust in God and keep your powder dry."

PROPHETS TRY TO HELP.

OUR brilliant contemporaries, the San Francisco dailies, have been keeping their "special leased wires" to the cabins of the weather-prophets very busy since the insurance men shook them into consciousness that there was something doing this fall in weather-wisdom. So far as we have noticed, they have had no reports from the weather-prophets of the longest renown—the omniscient wood-chuck and the sky-piercing wild goose. These time-honored seers have signified as little of coming weather as the diplomatic soothsayers have, recently, of the end of the war. And the wisdom of those half-baked prophets who do consent to instruct the public seems to consist in "knowing many things that aren't so." We have no time to follow all of them in their interesting speculations, but one of them invites attention by a colossal mistake he has made in mapping out the route along which he trudges to prophecy. No real prophet ever makes such a blunder as that. The old oracular boys at Delphi had more prophecies come true than any other bunch of futurists ever did, and they never entrapped themselves by telling how they did it. Even for twenty-five hundred years they have kept us guessing and that is the acme of prophecy. It is otherwise with Rehart I, "who for many years has prognosticated in the Chronicle the weather conditions facing the State." And Rehart gives

our neighbor this prophecy and the way of it:

"For the past forty-two years cold summers have been followed by more or less dry seasons, and for the same period of years, long, hot summers have been followed by seasons of more than normal precipitation. The last year the Pacific Coast has experienced an exceptionally cool spring, which extended to the month of July, indicating the following forecast:

"An exceptionally dry fall, extending to the month of January, followed by three short periods of normal precipitation in January, February and March, with a total precipitation of 75 per cent of normal."

BUT DO NOT HELP MUCH.

NOW Rehart may be a great cosmic prophet, for all we know, but to apply cosmic formulas to California always has been misleading, because California is different. For example, Rehart's doctrine seems to be that there will be an alternation of extremes; that if you have a cool summer you will have a warm winter; that if you have a sore toe it will be followed by a headache; that if you have a pain in the back it will be followed by an ache in the tummy—providing you are thick enough to differentiate the locations. This idea is, of course, a variation of the old idea of the "dualism in nature," which was probably written on the Assyrian tablets. Ever since then at least it has permeated the thinking of mankind in all relations of life. Good follows evil; light follows darkness; if your wife is beautiful she is likely to be bad; if she is homely she will probably be good; if it is cool in the summer it will be warm in the winter, and all that.

Now, as we have acknowledged, this may be a good cosmic theory, and may balance up all things natural and spiritual. We do not quarrel with it because we cannot claim to know anything in the cosmic connection. But even if perfectly true, in the way Rehart uses it for the world at large, it still does not fit California, and therefore, for us, is not edifying but misleading and deceptive. He prophesies for us that, as we have had a cool summer, we shall have a warm winter, but he evidently does not know that when we have a warm winter it is wet; that when we have our hardest freezing, with injuries to citrus trees, it is dry; that when the rains fall the temperature rises and frost danger, for the time being, is over; that the ideal California winter is one of warmth, with rains at short intervals and growing conditions all winter. Therefore, we claim that Rehart makes, from the point of view of his prophetic soul, a sad blunder, when he tells how he prophesies. If he had simply proclaimed his forecast we could only have dissented and doubted. As he tells his reason, based upon the old law of opposites, and says we shall have a warm winter and a dry one, we protest the fact that our warm winters are wet—therefore, we shall have what we most desire."

SAUL JOINS THE PROPHETS.

BUT while we are complimenting the terrestrial prophets, like the wood chuck, the wild goose and Rehart, we are not doing the fair thing this year by that other bunch of prophets, the sun-spotters. We are sorry for them; they are not in it; the clouds have been so thick and continuous that they could not get a squint at the mottled orb of day. They may come later when they are nearer to the event; it is safer to prophesy when you can see what is coming. And that is the reason why we are inclined to take a prophetic hand and play the game as we see it. If we can remember correctly all the monkeying we formerly did with rainfall records, they told that the seasons of greatest rainfall began early in the autumn, with just such moist, clinging storms as we have had during the last two weeks, and rains kept coming each month all through the winter. Such was the winter of 1889-90, and there have been many others. We remember that year best because we began building a house in September with particular specifications for a water-tight cellar of concrete. We got it all right; the water could not get out of it; it rained in and ran in from the surrounding country until it became plumb full, and we had to hire a fire company from the village to pump it out, so we could punch a hole in the bottom for drainage. And it rained on that house all winter until the floors bulged and the plaster sloughed off, and we learned that if rains begin in a businesslike way

early in the fall, it is the first step toward a season of most generous rainfall. But Rehart says we are to have an exceptionally dry fall and a season's rainfall of a quarter less than normal—and Rehart is an honorable man!

DEATH OF DR. A. J. COOK.

IT WAS a great disappointment to all Californians who knew him to be encouraged by reports, a few weeks ago, that Dr. Cook was mending, and would soon return to his place in this State, and then to hear of his death in Michigan on September 29. Dr. Cook had been a brave sufferer for several months, and before that was carrying the shadow about with him while still cheery and active in his accustomed work. He was brave, diligent, and devoted to his work, which, ever since he came to California in 1893, has been under the public eye, as it was previously at the East. He was born in Michigan in 1842, graduated from the Michigan Agricultural College in 1862, studied at Harvard in 1867-8, and the following year began his instructional work at the Michigan Agricultural College, and continued until he was called to Pomona College in this State in 1893. Coming to California was, however, in a way, a home-coming, for he had lived for a time, in the latter '60's, near Sacramento, where his sister, the late Mrs. Gammon, was a pioneer resident. Dr. Cook did notable work in entomology and bee-keeping in Michigan, where in 1877 he first made the type of kerosene emulsion which bears his name, and in 1880 was first to demonstrate the efficiency and safety of arsenites in fighting the codlin moth. Aside from his successful work at Pomona college, which did much to popularize that institution during the latter '90's, he was very active in farmers' institutes, farmers' clubs, etc., and was very forceful in promoting the organizations of citrus growers, which have proved so efficient and influential. Such useful educational and promotive work was continued for a decade later, and was finally recognized by his appointment as State Horticultural Commissioner of California in 1911. After that date he gave his time fully to that office, and resided in Sacramento until he went East, seeking relief from his physical infirmity, near the close of 1915. His resignation from his State office, submitted at that date, was not accepted by the governor, and he "died in the harness" as a fitting reward for a long life of exceptionally useful and distinguished public service.

APPOINTMENT OF MR. HECKE.

IT HAS long been expected that George H. Hecke of Woodland would be appointed State Horticultural Commissioner when a vacancy should occur, and Governor Johnson realized that popular belief by placing Mr. Hecke in charge of the executive horticulture of the State at the close of last week. We are pleased with the appointment, not only for what Mr. Hecke is, but for what we believe he is minded to do for the reorganization and rationalization of the executive horticulture of the State. As for what he is, any one can tell who sees him, for he is one of the most open-faced and open-hearted fruit-growers of California. To the very few in fruit-growing circles who may not have seen and known him, we are willing to say that we have been looking at him for quite a long time. It is probably nearly three decades since we first saw him at fruit-growers' conventions—a young man, cordial and companionable, but alert and serious always; with a brightness in his eye which would not dull and a smile on his cheek which could not be rubbed off, but always thinking and looking, lest any half-fact or light-weight idea should elude his scrutiny. Of course, such a youth must become a man of parts; of course he did practical things for himself, which succeeded because carefully thought out and energetically pursued; of course he did things for the community because his horizon lies far beyond his own personal interests. He knows fruit-growers' problems because he has met and successfully answered them in his own experience. And it is such attitudes of mind and such teachings of experience which he brings to the problems of his fellow fruit-growers as they now constitute a fundamental phase of California's greatest industry. His practical achievements in

this State rested upon thorough training in academic horticulture abroad and have been attended for many years with public service as county horticultural commissioner, and for some time, as county farm adviser. He therefore has many many points of view, and is rich in correlated experiences. His genuineness of sympathy and understanding are unquestioned. Why should he, having done so much, assume a public task the legal compensation for which he needs not at all? We answer it for ourselves in this way; he still feels the force of youth, though it now carries the wisdom of middle life; he is loyal to the State and wishes to serve it in recognition of the opportunity it has given him; he loves his fellow Californians and longs to advance the industry which he shares with them. Mr. Hecke's assumption of the office appeals to us as an obedience to a prompting to patriotic service which is quite characteristic of him.

WHAT CAN MR. HECKE DO?

Mr. HECKE can do just what we believe he is already intending to do, and therefore, what we say can have no aspect of offensive instructions. Let him make his department of the State government exactly what it ought to be—an executive branch charged with the enforcement of laws and policies for the protection and promotion of the horticultural industries in a straightforward and businesslike way. Let him organize the inspection and quarantine service so that there shall be reasonableness, uniformity, and certainty in it, which all in the State and out of it can clearly understand. Let him seek legislation which will bring to his department all the police duty which

is required in the promotion of industries with horticultural affiliations. Some of this is now associated with academic functions in the University, in a way they should not be, and let him cut from his schedule academic functions which the University should discharge. Let him strive to build up the county horticultural service so that county commissioners shall render more and better service in the executive work of the State department and arrange their work, in pest inspection and quarantine, statistical and fruit inspection, in co-operation with the State Market Commissioner, so that their year shall be full, their compensation adequate and their position self-respecting, and influential. Let him reconstitute those unique California assemblies, the State Fruit Growers' Conventions, so that there shall be a return to their original type—a forum for the conference of fruit growers on matters which belong to executive horticultural work in production, protection, promotion, commerce, transportation, etc., and not imitate the extension exercises of the University. Probably not less than half the time of a fruit-growers' convention should be devoted to reports of standing committees of growers charged with investigation of practical problems and discussion of such reports.

We are not claiming that this is all that should be done. We have only cited a few instances of the kind of things that should be done. Fortunately, a large and acute committee is now at work on this very subject, and will report at the Napa convention next month on the duties and relations of the State executive work for fruit growing. The outlook is hopeful.

are trimmed up high.—E. W., San Francisco.
If the trees are high-trimmed enough to give the ground a good deal of light, with good touches of sunshine at times during the day, we should sow Kentucky blue grass and white clover because nothing else fills up so well into a close turf if well watered and manured. If you wish to give less water and care, Australian rye grass and white clover will give you a fair cover. If the light is less, sow orchard grass and white clover. In either case dig in deeply not less than four inches thickness of good stable manure and sow as soon as you can get the ground into good condition so as to start the plants before the ground gets full of cold water. Afterwards you must use water and manure freely enough so that the tree roots and grass roots need not try to rob each other.

Lime Plaster and Cement Plaster.

To the Editor: I have lately demolished a house and have an accumulation of lime plaster which was in the inside, and of cement plaster which was on the outside. I have been thinking of having it ground so as to pass rather a fine screen and then distributed over my orchard and plowed under. How does it strike you?—Reader, San Jose.

It would not pay for the hauling and grinding. If you have the two separate, scatter and plow in the lime-plaster just as it is. It will disintegrate by natural agencies and return you lime value. You can use the cement-plaster as the foundation for a garden walk. If they are mixed, you can put them both in the orchard or under the walk as you think best. In the latter disposition they will give you a walk free from weeds for some time, probably.

Rye Grass at Elevations.

To the Editor: You recently commended rye grasses for wet lands. Does your answer to that apply to this part of California? We have land subject to overflow in the winter and early spring while at this time of the year it is very dry and hard. We have zero weather in the winter sometimes for two months. The altitude is about 4000 feet. Do you think those rye grasses will do in this climate and altitude?—W. A. D., Lassen county.

We do not exactly know for we have never seen it tried under exactly those conditions. English rye grass is the one to try as it is hardier than Italian. It succeeds in the Eastern States and other wintry regions. How it will act under your combination of freezing and overflow has to be found out by trial. We would sow at your elevation as the water goes off the land in the spring. The young plant goes through light frost all right.

Rye or Barley for Winter Pasture.

To the Editor: Which would you advise sowing for winter feed—rye or barley? I can irrigate the ground now and want to plant the best for pasture and to produce the most milk.—H. S., Goshen.

Rye is counted generally better: more active during frosts and more busy with too much or too little cold water, stands up better and is all around more hardy. It also has a wider reputation as a milk-feed. Wet down the land and get it in as soon as you can.

California Weather Record.

The following rainfall and temperature record is furnished the PACIFIC RURAL PRESS by the United States Department of Agriculture Weather Bureau, at San Francisco, for the week ending at 5 p. m., October 10, 1916.

By the Editor QUERIES AND REPLIES

Inquirers Must Give Full Name and Address.

Perpetual Motion with Johnson Grass.

To the Editor: What do you think of Johnson grass for filling a silo? Has it food value enough for milk cows? I have a piece of land with an average stand of salt grass, used for pasturage for perhaps 30 years. I am thinking of breaking it up and planting the roots of Johnson grass in the furrows, say every other one and one or two feet apart. You know it will soon thicken and have a good thick stand. I will cut it as often as it grows, to fill a silo, during the summer. Then, in winter, plow the ground deep and allow hogs to root and cultivate it, and eat all they can get: they won't spoil the stand. This would almost be like harvesting a crop all the year round. The soil is a light sediment with some alkali and I think it would not need irrigating. Kings county will afford plenty of roots for planting, so I would not have to buy them like a few farmers did, some 30 years ago from a man from Texas. Kings county is now looking for this man.—Reader, Lemoore.

Johnson grass is fairly nutritious. Johnson grass hay is shown to be about as good as Timothy hay. It also makes silage which the Louisiana station says is as good as corn or sorghum silage and works best for the silo when cut with a self-binder—for convenience in cutting, probably. It must be cut finely and packed well, as other grasses are for the silo. The question would be whether you can get enough growth on salt grass land to make it worth while. Johnson grass does not like alkali much better than Kings county likes Johnson. The last we heard of the man who introduced Johnson grass to this State he was in State's prison.

New Zealand Flax.

To the Editor: Referring to the article in your issue of September 23 I wish to ask what month of the year do we have to sow the flax and how much to sow to an acre? How much does it pro-

duce to an acre on fairly good ground and could we expect a full crop this year? From what firm could we buy the seed?—A. J., Oakdale.

We apprehended that some misapprehension might arise concerning the character of this plant, though if the article referred to is read carefully the nature of the growth might be understood. It is nothing like flax nor any other seed plant which can be handled like a grain crop and nothing more than the establishment of the plant could be secured the first year. It is now only known in California as an ornamental plant and is to be seen only in parks and gardens and in nurseries where ornamental plants are propagated. When old enough, the plant seeds freely in California but the few plants required now are more easily had by dividing old clumps. Correspondence with nurserymen and seedsmen who advertise in our columns is the best way to find out in what form a start is now available. When plants are secured from seed in a seedbed or nursery row, or by dividing roots, they are to be set out say four feet apart in rows eight feet apart—for each plant makes a large clump of fleshy, sword-shaped leaves, five or six feet long—the clump being several feet in diameter. The leaves can be cut with a strong corn-hook and must probably be handled singly. The plant is a vine of very strong fiber but we do not advise any one to take it up except in a small way to find out how best to grow it and who will pay a profitable price for it when grown.

Lawn under High Pines.

To the Editor: What kind of grass can I sow under yellow pines that will grow the most successfully? The soil is a kind of red clay. What is necessary for treatment of such soil? The trees

University Fruit Growers Co-operate.

[Written for Pacific Rural Press.]

An earnest young citrus grower near Redlands has been carrying on expensive experiments in pruning, mulching, cover crops, irrigation, etc., about two years. His name is Harry Cook. He hasn't turned out many results yet that can be definitely determined, but has this season begun records of individual tree production.

Many of the trees look as if the right treatment had not been applied—at least not long enough to show profitable results. Some of them are as thrifty and bore as heavy a load of pomelos or oranges as may be desired.

"But I don't know how to experiment, and it's mighty expensive doing it in the dark," he says. "What we need is for the Riverside Citrus Experiment Station to find out here, for this district, the best methods of pruning, cultivation, irrigation, handling cover crops, etc. We have different soil here than at Riverside. We private growers might at least be saved the waste due to unnecessary experiments, and ought to be helped in making records and interpreting results rightly."

"Such men," says Director H. J. Webber of the Citrus Experiment Station at Riverside, "we long to get in touch with, throughout the fruit sections. That is one of the most economical and satisfactory ways to get practical conclusions. We are very glad to consult with growers in all parts who wish to carry out careful experiments, and will co-operate with them in observing and interpreting results."

Prof. Webber notes that certain fundamental problems, such as the real cause of mottle leaf, or the movement of nitrates among or away from the roots where they are needed, if once solved at one place, can be easily controlled under other conditions by use of judgment in

adapting methods. The relation of sap flow, bud formation, etc., to pruning cuts, once determined at Riverside, would be the basis for the different methods of pruning which that knowledge would enable Orange county growers, for instance, to adapt to their moister conditions. The fundamental principles of fertilization, once definitely shown for citrus trees, could be applied, with easily learned variations in method, to walnuts, deciduous trees, etc. So it is with soil management and other fundamental problems.

The deep and long-continued, intricate work of solving these fundamental problems requires the most highly trained men provided with all the laboratory equipment necessary to interpret to the final solution, the results of field experiments.

Such high-grade apparatus cannot be obtainable by small institutions, and such highly trained capable men will not stay long or take such an active interest in their work unless there is a large number of other men there of about their own caliber to spur them on. They want to be connected with an institution of which they can be proud.

Thus, in solving the fundamental problems of a great industry such as fruit growing, it is necessary to have a fairly large institution such as the one at Riverside is becoming.

Co-operative Experiments.—When conclusions have been drawn here, it is necessary to test them out under all the general conditions of the fruit growing sections to determine the "generality of those conclusions."

To do this in the best way, most economical of time and money, the Station determines the general locations of such tests and tries to find a man there who will carry out the plan of an experiment designed "to give the best results and show to best advantage the points to be demonstrated."

There are several such local experiments widely scattered over the citrus sections, designed to prove or disprove for their localities the conclusions drawn from the Riverside fertilizer tests. Prof. R. S. Vaile, however, under whose supervision these are carried on, calls attention to the inability of the Station to comply with the numerous requests of people who wish to follow directions of Station men in managing their orchards and to pay all the expenses. On the other hand, Prof. Webber notes the experiment of one man who applied potash several years to five rows otherwise treated the same as the rest of the orchard, and failed to find any appreciable difference. This corroborated the results already shown with potash at the Station.

"If we could get such an experiment in each locality, the potash question would be settled," says the Director.

The Hillside Orange Association of Lindsay reports a satisfactory sale of a late shipment of Valencia's made early in September. This fruit sold as follows: Fancy, \$5.15 per box; second and third grades, \$4.40 and \$4.35 per box.

2 1/2 tons more to the acre than ordinary alfalfa is the record of Hairy Peruvian Alfalfa

Here's good news for alfalfa growers—a new thoroughly

tested plant that will produce the greatest alfalfa tonnage known—and under all climatic conditions. Has been tried out and endorsed by Arizona State Experiment Station, and by growers in both hot and cold countries.

Supt. of Arizona Station says: "Hairy Peruvian produces heavily in all climates practically the year round. Gives farmer maximum yield from his land. Does equally well at 5000 feet or at sea level. The plant is heavily leaved, thus giving highest food value. We recommend it above all other types." W. B. Cloyd of Yuma says: "Hairy Peruvian is greatest producer. I now get one more cutting per year." David C. Aepli of Yuma says: "Hairy Peruvian outyields other varieties 15% to 20% per acre."

Don't fail to plant Hairy Peruvian this season. Produces one ton more per acre than the famous Peruvian mother plant. Write for complete information.

Sprayed Peaches Blighted.

[Written for Pacific Rural Press.]

We found L. T. McKnight's five-acre orchard of bearing cling peaches in Fresno county disastrously blighted and gumming last spring. He had tried every treatment supposed to prevent blight. The trees were sprayed last November as soon as most of the leaves were off, with Bordeaux 5-6-50. The solution was made by hanging a sack of bluestone in a barrel of water, using no metal tanks. The fresh slaked lime was mixed in while still hot.

The spray dried white, but within two days after spraying, rain came and cloudy wet weather continued three days. A power sprayer was used at 120 to 200 pounds pressure, usually at 160; and a surplus of spray used. The aim was to spray a foot farther out on the limbs than he expected to cut in pruning.

The pruning was done practically all in February and each cut made just above a bud, so that there might be a little sap flow to heal the wound quickly.

Spring Spray.—Then on Mar. 11, he sprayed thoroughly with commercial lime-sulphur 12 to 1, when the blossoms on many of the trees were nearly all out and the most advanced leaves $\frac{1}{2}$ inch long. The trees were dry when sprayed and the weather good.

The blooms did not seem damaged; but when we saw the orchard Mar. 30, one end of it was badly filled with wilted dying twigs on which fruit buds had turned brown with small blackened areas around them. When the buds were pulled off, a gummy substance would come with them, stringing out from the twig until pulled apart. The worst infection was at the end where the trees were weakened by red spider last year. It had spread rapidly in the few days since Mr. McKnight visited the orchard previously. The trouble had appeared noticeably only a week before.

The McDevitt, McKevitt, and Orange clings were worst affected. Phillips and Tuscan seemed immune, though young unsprayed Tuscan in an adjoining orchard had the disease. Unsprayed Muirs and Lovells nearby were also badly affected.

Was the trouble blight, little leaf, Bordeaux too strong, or something else, and how was his procedure defective?

[Comments by Prof. R. E. Smith.]

Replying to the above communication regarding peach blight, I would say that ordinarily this disease is prevented with almost perfect success by spraying in November with Bordeaux mixture. The spraying in spring with lime sulphur is supposed to prevent any late blight infection and also to control curl leaf and peach worm. It is of course impossible to say at this time just how Mr. McKnight's failure came about and I can only make a few surmises upon this point. His lime sulphur spraying was decidedly too late, as this should be applied just as the buds are swelling. I would expect considerable burning from such a late application as that mentioned. The condition of the trees, however, as described sounds like blight and it is also mentioned that unsprayed trees appeared to be

in the same condition.

Regarding the spraying with Bordeaux mixture, it is stated that the lime was mixed with the bluestone while still hot. This is a mistake, as an entirely different combination is likely to result under such conditions and the two ingredients should be cold when mixed.

The only errors in the treatment, therefore, which I can deduct from this description are that the lime was too hot when mixed with the bluestone and the lime sulphur spray was applied too late. If the trouble was not due to either of these faults, I cannot tell what it might have been. Certainly when

properly applied nothing is more effective than these two sprayings for control of peach blight.

University of California.

DEMAND FOR NUT TREES.

[Written for Pacific Rural Press.]

Of three representative nurserymen of Southern California and San Joaquin Valley who were asked what demand has already shown up for next season's planting, one said almonds lead, while a big demand for walnuts is expected. Another said that walnuts were leading with almonds second. The other said that almonds were most generally demanded.

The Munger Vineyard of 80 acres in Barstow Colony was bought by Geo. Snyder of Sanger for \$30,000.

MORNING GLORY IN PRUNE ORCHARD.

To the Editor: I note you advise the use of "Nonpareil" as a morning glory exterminator. I have morning glory in both a three and five year old prune orchard. Do you believe the prune roots of either size trees to be far enough beneath the plow surface to not be injured by the use of such an exterminator?—R. W. S., Calistoga.

[An ounce of the liquid is applied with an oil can to the morning glory root after exposing it two or three inches deep with a short-handled hoe. This quantity at that depth in ordinary soil will not noticeably injure the trees. If the morning glory is thick, it might be well to play safe by treating that under only half of the tree at once.]

Make \$100 Land Worth \$1000 an Acre

*Don't work like a slave always.
Fruit Growing is easier and pays better.*

By Planting Fruit Trees

Probably every farmer has thought at some time or other that he would like to be a fruit grower.

Don't be held back by thinking you can't afford the first cost. You don't have to make the change all at once. Start with a few trees or with a few acres this season and plant more next year or as you are able.

As the trees attain size and come into bearing, the value of your land will go up—up—up, and you will have scarcely missed the initial outlay and effort.

*The Fruit Grower
Certainly has an
EASY LIFE Compared
with any other
Branch of Farming
—And He Makes Money Too!*

Be safe---be sure---plant Roeding's True Trees

Experienced planters know the advisability of setting out trees of known worth and reliability. It costs no more to plant and care for GOOD TREES than it does those of doubtful or inferior character. When you buy from Roeding—you get stock that is true to name, strong and hardy—you get the kind that produces fancy fruit, and that means fancy prices in any market.

A Splendid Stock of Citrus and Deciduous Trees and Vines

These nurseries can supply your wants in trees, vines, shrubs and plants—shipping your order complete—packed in A-1 condition so as to reach you safely—at the time you want them. We have a splendid stock of nearly everything that the planter could want—apricots, almonds, pears, plums, prunes, peaches, nectarines, cherries, walnuts, pecans, olives, oranges, lemons, etc., as well as a very extensive stock of ornamental and evergreen trees, shrubs, climbing and trailing vines, roses, palms, etc.

Tell us your plans---write us today

Our many years of experience in planting, pruning, packing, etc., are at your service. Being in very close touch with conditions and knowing what will likely be the most profitable and desirable varieties for you to set out, our advice may be worth a great deal to you. It will cost you nothing to send us your list of what you figure on planting—or tell us your plans and ask us for suggestions. To do so will not obligate you in any way.

Cows and Productive Grapes.

[Written for Pacific Rural Press.]

Alfalfa, cows, and raisins are bringing H. W. Wilson of Kerman to prosperity. From 3500 three-year Thompson vines, he and his wife picked 2500 trays averaging 25 pounds each. From 15 acres Mr. Wilson cut enough alfalfa to feed their dairy herd, seven of which were milking when raisins were picked.

Starting with limited capital and less experience three or four years ago, the vineyard was set out, an orchard planted, alfalfa sown, buildings put up, and cattle bought. Not all the cows were good producers, and a dozen or so have been discarded, being replaced by better ones. A grade Guernsey now owned produces over 5 gallons per milking when fresh and averages 6 gallons daily for 7 months. Nothing is fed but alfalfa, though better results might be obtained if capital were available to buy a balancing feed. The irrigation ditch running through the vineyard is the only cow pasture. Manure of course is applied to orchard and vineyard.

Last year the whole vineyard produced 32 trays. Then the Wilsons began following the Henry system with results indicated above.

Irrigation was applied when the vines needed it, not early in spring, for that is a cause of coulure. A second irrigation came July 15, flooding by long contour checks. On a certain knoll, not enough water was applied, and the leaves dried up so they crackled. So about Sept. 7, this knoll was irrigated again in spite of prophecies of waterberries. The waterberries didn't come, the

vines recovered, the leaves a week later were juicy and green, and the fruit big, plump, and hard.

To get an early maturing second crop, the end buds of the vines were pinched off as soon as forms of bunches appeared in spring. Mrs. Wilson did most of this; and it made her fingers sore. They were not yet healed when the lateral shoots started which were to bear the second crop. A little later, the whole vineyard was pinched again to get the later-opening buds, and at the same time, all non-producing shoots were thinned off to throw all sap into grapes and fruit canes. The two pinchings, including the thinning out of sterile shoots, took about a week of full working time, though it was done at spare time from the housework.

SPRAYING POINTERS.

An ordinary cyclone nozzle makes a hollow cone of spray so if you aim at a certain part, you don't hit it, but spray all around it.

The best use for a cyclone nozzle is where you keep well away from the object sprayed so the fog will distribute itself.

Scale sprays should be applied with force.

Increase of pressure finally reaches a point where the spray becomes so fine that it loses its speed and force.

To find the pressure at which your nozzle will spray with greatest force, spray against a mild breeze with constantly rising pressure. Have another person observe the front edge of the spray. At its maximum distance, read the pressure gauge and spray at that pressure whenever greatest force is desired.

The amount of spray used does not increase in the same ratio as the pressure, but does vary directly as the size of the nozzle hole is greater or less.

Hand pumped spraying is usually underspraying.

Flour paste improves efficiency of any spray that must adhere, but the spray must not be thickened enough with it to flake when dry. The flour should be boiled in water to a paste rather than mixing dry flour into the spray liquid.

Lime-sulphur is supposed to kill insects mostly by the chemical withdrawal of oxygen from the insects' bodies to combine with the lime-sulphur compound.

Repeated annual sprayings with lime-sulphur or Bordeaux tend to harden the bark of trees so that it cracks. An oil emulsion spray should be used once in a while for this reason.

Soap sprays act by clogging the breathing pores of insects and also by helping spread other spray ingredients.

Many trees have been killed by accumulation of oil sprays around their bases, the oil penetrating the bark.

The new manager for the Fruit Growers' Supply Co., which operates in connection with the California Fruit Growers' Exchange, is A. M. Mortensen, who has been traffic manager for both the Exchange and the Panama-Pacific Exposition.

GIANT
Lifted this one

—Six feet through at base, 4 feet 6 inches through at top, five feet above ground.

Giant Stumping Powder did a clean job, taking out roots and all without tearing a big hole in the ground. Farmers who have used them know that

GIANT FARM POWDERS
STUMPING — AGRICULTURAL

always save them money, time and work. They save money because they lift and heave as well as shatter, and go further than high explosives that merely split the stumps. They save time and work because they get out the stumps—big or little, green or dead, in a condition easy to handle. "I get better results from Giant Powders than from any other powder I have used," says A. E. Adkins, Woodburn, Ore.

There are two Giant Farm Powders, both made especially for Pacific Coast farmers. Eureka Stumping Powder is most economical for dry work and Giant Stumping Powder saves money in stump blasting in wet soil. Try these two. Compare them with the powder you have been using, and you will always use Giant in future. Write us and we will have our nearest distributor supply a trial case at the lowest market price.

Mail the Coupon for Free Books

Better ways of removing stumps and boulders, making ditches, planting trees, and breaking up the subsoil are described in our five illustrated books. They were written for western farmers, to meet the conditions that you have. Choose the books that you prefer and mark and mail the coupon today—before you forget it.

Pear Blight Winters Over in Cankers.

[Written for Pacific Rural Press.]

Pear blight cankers which live over winter are the sole source of the disease next year. If allowed to remain, they exude infected milky gum next spring. This is carried abroad by myriads of insects, and those visiting blossoms leave the infection to kill the fruit a-borning and spread down the twig or spur. Flies and ants have been proved to carry the disease from gummy spots to other parts and to other trees. Thrips and bees are active spreaders of the germs.

A healthy pear orchard produces good money, but if any blight in it carries over, and the spring weather is favorable for its spread, the attack may be sudden and disastrous, as it has been in unnumbered surprise attacks.

Before the ground is muddy, while blighted leaves still hang, and the healthy bark has perhaps not settled into its winter dormancy, the twigs can be more easily found and cut out, and the cankers more easily distinguished on trunks where the bark is thick. Even so, it will be better to gouge narrow incisions through the bark from crown to the smooth bark above, if there is reason to suspect diseased trunks, for not always is the disease visible. It has girdled large numbers of trees underground with no signs above.

Special study and care with disinfectants is absolutely necessary to avoid spreading pear blight with tools. The disinfectant rapidly deteriorates in metal or even wooden vessels and with rags or sponges to apply it to the tools. Rags and sponges, too, usually do not wet

every point on the tools that may harbor germs, and the disease is thus spread. The time is likely to come when tools will be dipped into the solution which will be carried in glass or earthenware vessels.

Burning of all diseased prunings is necessary; for the germs are likely to live in them all winter and ride jubilantly on some insect's bill to the scene of its next season's destruction.

MELILOTUS LEADS.

[Written for Pacific Rural Press.]

A Sacramento Valley seed company answers our inquiry concerning the demand for different varieties of cover crop seed, in the following way; but suggesting that we should not give the impression that the Sacramento Valley is the source of supply.

"Last year the principal demand for cover-crop seed with us was for Melilotus Indica, although we also sold considerable bur clover and vetch for the same purpose. However, for cover-crops we believe that in this section and all of California south of us where seed is used for this purpose, that the Melilotus Indica will have the demand. It is so very much cheaper for cover-crop, and as it appears to have given such general satisfaction, we believe this seed will very largely supersede all other varieties of legumes.

"We will, no doubt, use a couple of hundred tons of this seed during the fall and while it is not so difficult to procure the seed in the rough, there is a great deal of trouble in dressing it down so that

it will germinate well and make an attractive article."

Mechanical Power on the Farm.

Users of tractors, engines, pumping plants, motor trucks, automobiles, electric motors, and other mechanical farm power are invited to make this department an exchange of your experiences and troubles.

DAIRY DUE TO PUMPS.

[Written for Pacific Rural Press.]

Nine years ago V. J. Lanini purchased 220 acres in what was considered an arid district of Monterey county, intending to make dairying his chief occupation.

Others scoffed at the idea; but after boring a well 120 feet deep, and securing a good flow of water with a 38-foot lift to the highest part of the land, which was to be seeded to alfalfa, the feasibility of his plan became apparent.

The expense of pumping this water was naturally more than on ranches where gravity water was available; and for that reason, together with the fact that the soil took water freely, all of the ditches were cement lined, thus overcoming all loss by seepage. Now there are 60 acres of good alfalfa on the place and another 60 acres will be planted the coming year; also 75 milking cows are maintained that are producing 220 gallons of four per cent milk a day, the product averaging better than \$1.50 a hundred pounds the year round when sold to the local condensary.

Breedings.—The breeding of his cows is mostly mixed, with Durhams predominating; but a purebred Holstein bull is being used at this time. Two reasons are given for keeping a mixed herd: (1) it increases the per cent of fat in the milk, the buyer preferring a four per cent milk; (2) it makes no inconsiderable difference in the price received for bull calves. These, because of their beef charac-

teristics, are sold to the range men at \$8 or \$9 when born.

Heifer calves are never sold, even in spite of the fact that they are raised on whole milk substitutes. In fact Mr. Lanini raised 40 heifers last year with a very small quantity of milk and never lost a one. His heifers are fully as well developed as one sees anywhere.

Prepared calf meal has solved this question, a handful, mixed with a small amount of whole milk and a larger amount of warm water, having been found most satisfactory. Alfalfa pasture is also provided and coarser roughage, such as straw, has been found good to have stacked in the calf paddocks.

Sanitation.—As the market demands sweet, clean milk on delivery, the chief factor in sanitation is a well-ventilated, concrete-floored milk room, equipped with a coil milk cooler and a two burner oil stove for hot-water heating. The latter is particularly well liked by Mr. Lanini as it is cheaply operated and furnishes plenty of heat for the sterilizing of utensils, without being dirty.

A galvanized iron pipe frame, 5½ feet high furnishes support for the cooler and receiving vat, the milk being poured through the outside wall of the building into a tank whence it is drawn and run over the cooler, into another vat, also supported by the iron pipe frame.

Iron pipe has also been used to good advantage in constructing milk

can racks along one wall, allowing free drainage of cans when set upside down as well as ventilation.

Good clean drinking water is pumped for the cows at all times into concrete watering troughs, of which there are two with 1,000 gallons capacity and three with 2,000 gallons capacity at various parts of the corrals and fields.

Both in permanency and cost these troughs are superior to wooden ones, the thousand gallon ones being 16 feet long, 30 inches wide and four feet high and costing \$16 for material. The larger kind cost more, but serve two fields as they are placed along and extend on either side of the division fences.

THE GAS-ACTION OF FARM EXPLOSIVES.

Of late years there has come on the market, in response to a growing demand from farmers, explosives particularly suited to their work. The coal miner has his particular kind and grade of dynamites and powder, and the rock and quarry man his kinds. Too often the mine and rock powders and dynamites have been sold for farm purposes, and the result is that the stump blasting, or subsoiling, or ditching, is not done as it should be, either in cost or effectiveness.

For removing stumps, and most particularly for soil tillage with explosives, a certain comparatively

DEEP WELL TURBINES

No valves to pack or plunger rods to get out of order. For use in any well ten inches in diameter or over.

A complete line of irrigating pumps of all descriptions, horizontal and vertical for belt drive or direct connection to electric motor.

Prices as low as are consistent with good quality and workmanship.

BYRON JACKSON IRON WORKS, Inc.

SAN FRANCISCO. LOS ANGELES, STOCKTON, VISALIA

New Model YUBA 20-35 Successor to the Model 18

Over 60% of the developed power is converted into actual work—that's tractor efficiency.

The transmission is completely enclosed—it is built as carefully as a watch.

Completely equipped with Hyatt high duty roller bearings. The BALL TREAD has all the frictionless qualities of the ball bearing. The minimum amount of power is used to move the tractor itself.

The renewable ball race is now made in two parts, and will permit of greater wear. There is room for larger oversize balls.

The new track is boltless, needing no attention. The treads are of high carbon cast steel. Wearing points are thickened. The tread has greater traction.

The air cleaner is more efficient and requires next to no attention. The radiator also is much improved. A heavy-duty long stroke motor is employed. It is ideal for a stationary power plant. The crank shaft is larger.

The oiling system is of the force feed type. The distillate tank is larger—holds 38 gallons.

A request from you will bring by mail a thoroughly detailed description of this new model—the most perfect application of farm power ever produced.

Hundreds of farmers and other users of the Yuba Ball Tread Tractor have, for three years, been helping us build the new model 20-35. Through our Service and Engineering departments an intimate touch has been kept with nearly every machine sold. The behavior of every part of each machine in the most exacting service has been under observation. Wherever an improvement in material or construction was suggested, it was carefully noted. Opportunities for minor changes were noted.

One by one these suggestions were tried out. Engineering skill of the highest

THE YUBA CONSTRUCTION COMPANY

SAN FRANCISCO

Works at Marysville, California

MANUFACTURERS OF THE YUBA FLOW, THE YUBA PUMP

Replaces 20 horses at the drawbar and gives 35 H.P. on the Belt
More power. Less upkeep

quality has been constantly experimenting and proving up the suggested changes during these three years. The result is the new model 20-35; replacing 20 horses at the drawbar, and giving 35 H.P. on the belt.

The new model replaces the model 18, the most popular tractor in the west. It has more power, and less upkeep. But note this important fact: the improvements are minor, and each of them can be made at a reasonable cost on the old model 18. These three years of persistent search for defects have proved the original design to have been in the main correct in principle. YUBA owners now have assurance that their tractors never become obsolete.

THE YUBA CONSTRUCTION CO.

slow, lifting, heaving and cracking gas action is wanted. This is totally different from the quick, sharp, shattering and cutting action of most mine and quarry explosives. The proper farm powder will produce an entirely different condition in the soil than will an explosive which is best to use for breaking up stone. The blasting of earth, particularly dry earth, and the removing of roots from the earth, is an entirely different proposition from the blasting of stone. In fact, the stone explosive can not be used with satisfaction in soil work. You cannot get the effect desired.

Another thing that should be more generally known is that the right kind of farm powder costs less than the stone or mine explosive. It is made with an ammonia base instead of a nitroglycerine base, and in these days of war nitroglycerine is a mighty expensive commodity. The average 40 per cent dynamite is both expensive and inefficient for farm work, compared to the right kind of farm powder. The farm powder is somewhat safer than the dynamite, too, because it requires more of a shock to explode it.

CHAIN-TRACK TRACTOR.

[Written for Pacific Rural Press.]

An interesting little tractor was tried out for the first time at the Puente demonstration. It is the latest put out by Lambert Tractor folks. This one was made in Los Angeles county and handled by Wm. Gregory. Its feature is the track, on which almost the entire study has been put.

The machine pulls 8 h.p. on the drawbar, is not over 3½ or 4 feet high, guides by two wheels in front, and is run by a "chain tread" track. They expect to put out a machine without wheels but with two tracks.

The track is made of four heavy chains, to alternate links of which are fastened with U bolts, cross bars made by riveting two angle irons into a T form. The flat side of the T's is inside for six eight-inch roller wheels to roll on, supporting the weight of the machine. The track is revolved by a driver wheel the sides of whose rim are separated by roller bearings. These rollers engage teeth clamped to the centers of the T's, thus revolving the track.

The advantages sought and claimed for the track are simplicity, durability, easy to change any part that might need it, and cheapness. The chain and tread can be replaced entire for \$25. The links have only a very slight bend from a straight line when turning the ends of the track, and there is no chance for dirt to get between them or to stay there, for the chain is not oiled. A cold-shut link connected the ends of each chain and others could be quickly inserted in case of breakage. A link was shown us which had been used in plowing 60 acres, and it had scarcely been worn to a good bearing.

In the general demonstration, this tractor pulled two disk plows 6 to 8 inches deep in the hard soil at above the ordinary speed, with its engine sputtering along as if it could do lots more. In its private demonstrations a disk cultivator was often pulled about the field, three or four of the disks reaching beyond each side of the tractor.

It will be interesting to observe this "chain-tread" track proving itself in actual farm work.

POWER ON POULTRY FARM.

[Written for Pacific Rural Press.]

Fixing up a poultry farm with ingenious and economical conveniences, is C. H. Hosford's great pleasure. His establishment in Riverside county for hatching 6000 to 7000 chicks at once from eggs produced on the place is nearly a model of convenience in handling the business.

The chief factor in such work is the power outfit used in doing it. On this ranch, a special building is set aside for this purpose. A 3 h.p. electric motor was bought cheap, second hand. A smaller one would do their work now at less cost for electricity, but additional equipment may be added later.

The motor runs a lineshaft overhead. This runs a fine band saw rigged up to cut the circular holes in partitions for trapnests as de-

scribed in another article. Another belt runs a circular buzz saw by which Mr. Hosford cuts all lumber for henhouses, buildings, nests, boxes, etc., as he designs them. Another belt runs a grindstone. Another runs an 8-inch green-feed cutter, for green chopped alfalfa is especially desirable in the fall months. A great deal of dry mash and other feed is now mixed by hand

with an excess of labor which might possibly be put to better use. The motor would easily run such a feed mixer as those described in our columns heretofore.

The three days rain ending Monday of this week was the heaviest we had in Southern California for a number of years so early in the season.

Uni-Lectric
GASOLINE-ELECTRIC UNIT
LIGHTING SYSTEM

Electricity for Farm Homes

At one-third cost of juice from Power Company, (thus includes interest on cost of plant). It is the simplest and most economical plant on the market.

No Batteries - No Switchboard - No Rheostat.

Will operate 50 lights 7½ hours for 11c. Will also operate electric fans, irons, small motors, etc.

If your buildings are not wired, send us plans and we will give you full instructions so that you can wire them yourselves. Material furnished at lowest cost.

PULL

*— that's what
counts in plowing*

You need power in a tractor—dependable, steady power—and you get it in the Caterpillar. But you need something more—you need that power converted into pull at the drawbar with least possible loss. There are two reasons why the Caterpillar outpulls most tractors of the same rated horsepower

- there is no loss of power through slippage—the sure ground-grip of the long, wide tracks prevents that.
- Holt construction gets the power from motor to drawbar with minimum frictional loss.

CATERPILLAR

Reg. U.S. Pat. Off.

You can depend upon the Caterpillar to give you service, day after day—day and night if necessary—with low operating cost and minimum upkeep expense. There's a reason why the Caterpillar was awarded the Grand Prize at both California expositions. There's a reason why it wins highest honors in

every competitive test. Study the Caterpillar and you'll find that reason—right design, right materials, right construction. Or, better still, investigate the records of Caterpillar owners. Their success and satisfaction is a sure guarantee that you, too, will find the Caterpillar the most profitable tractor investment.

Let us give you more facts and figures about the Caterpillar. A request for Catalog No. C 342 will bring you full information. Send for it today.

General Agricultural Review.

FIELD CROPS.

The ranchers around Wyandotte are engaged in sowing grain. The recent rains have put the ground in fine shape.

Continuous storms in the past week throughout Nevada have done considerable damage to grain and third-crop alfalfa.

E. G. Outland of Santa Paula reports on his ranch a lima bean stalk ten feet long and containing 657 well-filled pods.

Asparagus may become an important Turlock product, as packers are trying to interest farmers in the culture and growth of this vegetable.

J. H. Stephens, president of the Rice Growers' Association, plans to go to Louisiana and Texas for graders to handle the California crop.

The present value of the small bean crop around Salinas has been estimated at \$360,000. As high as seven cents a pound has been obtained.

California leads all states in average yield of cotton per acre and in condition. Condition is rated at 93 and average yield per acre 484 pounds.

The Woodland rice mill will begin operations November 1. A warehouse in connection and for storage of the product is under construction, with a capacity of 200,000 bags.

The Oakdale pea cannery has resumed operations and is working with a big force on lima beans. The company has an extraordinarily fine crop of lima beans on the 85-acre tract of bottom land.

The Sacramento Valley Sugar Company has received two carloads of beet seed and is expecting more in the near future. The seed will be planted in territory which will make possible the opening of the sugar factory in Hamilton City.

The largest grain deal consummated in Northern California this year was the purchase of the crop of the Stovall-Wilcoxon Co. ranch near Williams—18,876 sacks of wheat, and 28,615 sacks of barley—for about \$96,500.

The proposal by the western railroads to charge \$1 and \$2 respectively for bedding single and double deck livestock cars, in traffic from the southwest, is suspended by the Interstate Commerce Commission until Jan. 20. It is now furnished without charge.

A man representing a Chicago food firm has been in Biggs lately looking over the product from four rice fields near here with the idea of establishing a western factory on the Pacific Coast, for a product known as "Cream of Rice." It is made from rice and powdered milk.

The State Railroad Commission, after a rehearing, has decided that the reduction ordered in rates on paddy rice, moving from points in the Sacramento and San Joaquin Valleys to San Francisco, Sacramento, Biggs and Gridley, will not affect the earnings of the river boat lines.

G. W. Hume Company's Turlock cannery closed the 1916 season completing the largest pack in the history of the establishment. The total pack of the season was somewhat in excess of 100,000 cases, comprising 80,000 cases of peaches, 15,000 of apricots, and 5,000 of pears. The pack exceeded that of 1915 by 30,000 cases.

W. Barnes recently harvested three hundred pounds of alfalfa seed from a planting made on his ranch near Blacks Station (Yolo county) thirty-eight years ago. During this interval there has been no replanting, no irrigation and no renovation of any kind except one cultivation some years ago. The plot (8 acres) has done noteworthy service as pasture and besides producing the

above harvest of seed it has yielded about eight tons of hay the present season.

DECIDUOUS FRUITS.

J. W. Roller of Pomona has a five-year-old peach tree that is bearing its second crop. It produced a crop in June. The tree was watered with some other trees, blossomed again and at last report had 500 well-developed peaches on it.

Following protests by fruit farmers that Sunday auto parties had been pilfering fruit from orchards alongside the highways, a special fruit-officer has been appointed in Contra Costa county. Twelve arrests were made last Sunday.

The California Prune Festival Association, San Jose, announces that the seven days preceding Christmas shall hereafter be known as Prune Festival Week and that the giving of prunes as Christmas presents shall become a custom in the land.

Because the rains kept many people away from the apple show at Yucaipa last week, it was continued Sunday, Monday and Tuesday. The crowds have been the greatest in the history of any of the five shows held, and the exhibits from the 5000 acres of apple orchards have been larger than ever before.

The Sixth Annual Apple Show of the Mendocino Farmers' and Apple Growers' Association will be held in Ukiah from Oct. 25 to 28, inclusive.

A good many pear-raisers in Biggs valley sold their pears green this year, getting \$36 to \$40 per ton. Heretofore nearly all the pears have been dried. Those who dried their pears this year still have them on hand.

Santa Cruz county apple growers estimate their losses on bellefleurs this season at between \$75,000 and \$100,000 due to a county ordinance preventing shipments of so-called "green fruit." Leading growers contend it is better to leave the time of apple shipments to the judgment of the shipper rather than to a law which may affect one orchard and let another go scot free.

CITRUS, NUTS, SEMI-TROPICAL.

Herbert D. Derwin, a prominent and wealthy orange grower of Up-lands, died recently at the age of 43 years.

Thirty pickers were put to work Saturday, October 7, on the lemon grove of Parr & Shippey in the Zante district north of Porterville.

The walnut season in Orange county is two or three weeks earlier than usual, and all crops are expected in before mid-November.

The cracking test on walnuts this year is 87, while last year only 85 per cent of the nuts were required to be good. In Orange county they are "cracking out" 90 to 96 per cent good.

The Ehmann Olive Co. has purchased the Fogg olive grove of 40 acres located on the bluff overlooking the Feather river opposite Oroville, for \$50,000.

The advertising appropriation of the Calif. Fruit Growers' Exchange this year will be about \$275,000 for oranges and \$105,000 for lemons, according to Assistant Manager E. G. Dezell.

Tribble Bros. Nurseries had a fine display of all kinds of nuts at the Fresno Fair on plates, labeled with variety names. It was a fine chance for comparison of the 13 varieties of almonds, and many walnuts, besides hickory nuts, pecans, butternuts, and other kinds.

The orange season will soon open in Tulare county. The oranges and grapefruit there are the first to ripen. The Board of Supervisors by unanimous vote passed an ordinance establishing an 8 to 1 standard, eight parts soluble solids to one part of acid, as the standard of

maturity and the shipments of all others prohibited. It further provides that each shipment shall be accompanied by a certificate issued on the authority of the Horticultural Commissioner setting forth that the oranges accompanying the certifi-

cate are up to standard required.

GRAPES.

A considerable amount of Zante currants is being grown in both Fresno and Placer counties.

Probably 30 per cent of the 1915

OUR FREE PUMP CATALOG
Contains a wealth of information.

We want you to have this amazing book. It is one of the most helpful booklets of its kind ever prepared. Contains volumes of information about irrigation, and also tells about the famous Layne & Bowler Pump.

Layne & Bowler CORPORATION
900 Santa Fe Ave., Los Angeles

Satisfaction!

Says James Hughan, of Downey, Cal., under date of Dec. 16, 1915. Here is his letter: "Eight years ago I bought a 25 H. P. Commercial Engine and have been using it ever since. Am pleased to say it has given entire satisfaction and is running as well as when it was installed. Repairs have cost so little that it is not worth mentioning. "Last summer I replaced my batteries with one of your Plugoscillator Magnetos, and am more than pleased with it. No trouble to start and no trouble while running. "Will say that I have had more satisfaction from the money spent with your company, than any money I ever spent in my life."

That's what a practical man says of the

Commercial Engine

625 Market St., San Francisco

seeded raisins handled by the Associated Raisin Co. were packed under their own brand.

A group of wine grape growers in the San Joaquin valley pooled grapes and sold to independent wineries and through the California Associated Raisin Company. They got \$15 per ton.

From three acres of eight-year Thompsons and Sultanas, A. B. Cate of Clovis never picked over 900 trays. This year he picked 2500 trays. He has followed Frank Henry's weekly instructions.

The Associated Raisin Co. is already working on new contracts for the five years to follow 1917 in which present contracts expire. Some of the objectionable features will be changed and the plan will be submitted about New Year's.

The East has developed a taste for Escalon's famous grapes, Ladyfingers. Last week a mixed car of Tokays and Ladyfingers reached Cleveland, O., and that city readily paid \$1.60 per crate for the Ladyfinger grapes, while the Tokays sold for about \$1.20.

H. F. Stoll, member of the viticultural commission, has just returned from a trip over the State. He says: "The wine grape growers are well pleased over the present outlook. The prices that are being offered for grapes are better than they have been for several years. The dry wine districts growers are getting from \$20 to \$25 a ton for their grapes, according to varieties, while those in the sweet-wine districts are getting from \$12 to \$15 a ton."

MISCELLANEOUS.

The Vine Hill school district, near Martinez, ordered school closed for two weeks while the students picked grapes.

Kerman booth won first prize for general agricultural and horticultural exhibit at Fresno Fair; Clovis 2nd, and Sanger 3rd.

Poultry Breeders' Directory.

BARRED PLYMOUTH ROCKS—"The kind that Win and Lay." Eggs for hatching and choice stock for sale. Have bred Barred Rocks for over nineteen years exclusively. Write for catalog showing winnings at California's leading shows. Chas. H. Voden, Box 396, Los Gatos, Cal.

INCUBATOR CHICKS—Thoroughbred White Plymouth Rock, \$25.00 per hundred; White Leghorn, \$12.50 per hundred. Highest class of stock bred to standard and to lay. Awarded all first prizes at California State Fair 1916. Mahajo Farm, P. O. Box 597, Sacramento, Cal.

BABY CHICKS NOW READY—Hatches every week. Write for special "Fall Chick" circular. See why Fall chicks pay. R. I. Reds, Barred Rocks, Black Minorcas, White and Brown Leghorns. Campbell Poultry Ranch, Campbell, Cal.

CROLEY'S DRY MIXED INFANT CHICK FEEDS for twenty-five years have been California's standard feed for baby chicks. Insist upon getting same from your dealer. Manufactured by GEO. H. CROLEY CO., Inc., Poultry Supplies, San Francisco.

TRAPS AND GUNS

We pay highest prices for Furs, and sell you Traps, Guns, Supplies, etc., at **FACTORY PRICES**. Write for **FREE CATALOG, TRAPPERS' GUIDE**, and Fur Price List. E. A. STEPHENS & CO., 243 Stephens Building, DENVER, COLO.

Homestead entries in Shasta, Siskiyou and Tehama counties are to be enlarged to 320 acres after October 10. These entries are for arid or "designated" land.

RAIN DAMAGE.

Bean harvest was on, and the rain made fields so wet that work in many cases had to cease, leaving beans to stain and rot in the field.

Prices on lima beans and raisins to the trade have been withdrawn until more accurate damage estimates can be made than are possible at this writing.

Alfalfa that had been cut for seed was nearly all ruined. Considerable damage was done to the different varieties of corn, especially gyp, as a great deal of it had been cut and thrown in piles. A large part of the last cutting of alfalfa was badly damaged, as most of it was either in the windrow or shock.

Rains since Sept. 30 all over the producing parts of the State have done heavy damage to raisin and bean crops wherever grown commercially, except that most of the Thompson and Sultana grapes were already in stacks or sweatboxes. Walnuts were mostly gathered, and will not be much affected. Figs are considerably damaged. Some of the raisins are being saved by artificial driers; others, dry enough to stack, have been sulphured to kill molds. Raisins left stacked in the vineyards are likely to mold or sour unless wind and sun save them.

SHAKING SAND OUT OF RAISINS.

[Written for Pacific Rural Press.]

The recent rains will result in lots of sand in the raisins. If you don't take it out, the company will. If you want to deliver clean raisins, tack a quarter-inch-mesh wire screen over a bottomless lug box, set it on

a light sawhorse, dump raisins in, and shake the sand out. If a sweat box is used to get a big job done more quickly, the wire must be braced by strips nailed across under it. Then the sweat box may be hung by wires to make shaking easier.

IMPORTANT NOTICE---To intending Tractor Purchasers, regarding the

BIG BULL TRACTOR

\$645 f. o. b.
Minneapolis

—IF YOU ORDER NOW!

NEW IMPROVED MODEL—STUDY THESE FEATURES CAREFULLY.

WE HAVE BEEN ADVISED by the factory that the price of the Big Bull will increase at least \$150 as soon as their present stock is disposed of, owing to the high cost of the new improvements and the continued advance of materials, which have gone up 300 to 400 per cent.

OUR ALLOTMENT OF THIS STOCK IS LIMITED. We expect it to be closed out in the next 30 days. So we earnestly urge all intending tractor purchasers to take advantage of the present price—which is, as we advertise, \$500 to \$700 lower than the price of any other tractor of equal capacity.

REMEMBER YOU ARE GETTING ALL THE NEW IMPROVEMENTS—including Kingston High Tension Magneto with impulse starter—which eliminates batteries—Hyatt Roller Bearings, Patented Dust Trap and Distillate Burner—which cuts out dust troubles and allows you to use cheap fuel—new improved radiator, covered counter-shaft gear, etc.

Livestock Facts and Fancies---IV.

[By the Editor.]

If one reads and listens, observes and thinks about the purebred animal, as we suggested it desirable to do in last week's issue, he will soon find dawning in his mind new perceptions of specific differences between the purebred individual animal and the scrub, or common animal, and new conceptions of what the differences signify in the superior capacity of the purebred to be and to do desirable things. This is an attitude of mind which should be seized upon and encouraged by the beginner. It is the very same thought which the primeval man who did the first bit of breeding had: it is the thought which the founders of the now well-known breeds started with. It is the foundation of preference and selection. Without it all the broader conceptions of advantages of breeding, either could not have arisen or would have been frittered away before realization. Therefore encourage yourself to study the differences of individuals. Study the score card, which is simply a record of differences which you must see and understand or you cannot estimate them aright. Score everything you see of the kind you elect to follow—whether it be an Irish bull or a saw-horse.

Of course it is not our function to explain what you must see and how you must judge it. That you can get from the books or from your instructor, from discussions with breeders of experience, from close watching at the ring-side, from study in your own corral, etc. If you should ever think you are getting wise quickly, kick yourself. You will learn as long as you can see and when your sight gets dim you can feel, but you will never know it all. Methuselah lived 969 years herding stock on the plains of Canaan and probably worked off many culls on the cattle buyers of several short-lived, prehistoric Pharaohs, but he did not know enough to teach his grandson Noah to select both beef and dairy types for his shipment to Mt. Ararat. You can now learn from a dollar and a quarter book more than Methuselah learned in a thousand years, but even with that start you will not land much nearer to encompassing the infinitude of wisdom which the Creator has locked up in the domesticated animal, than he did. But remember that you can still get a little nearer to living a fruitful and understanding life than any man ever did before you, if you do not get too cock-sure and conceited over the first things you learn about purebred stock.

Perhaps we can suggest something about the proper attitude of mind, with which a beginner should view a purebred animal by reference to our own experience. There is nothing new about it. It is common experience, but by citation of personal reference we may perhaps visualize it for you, as the movie men say. It was our good fortune in 1873 to stand close in when the English Earl Bective paid \$40,600 for the 8th Duchess of Geneva at the New York Mills sale of Shorthorns—bidding against the Alexan-

ders of Kentucky. It was the highest price ever paid for a horned animal. As we remember, the cow was a good looking roan, but no better, so far as we could see, than others which sold for a fraction of the amount. And so we asked the next man why they paid so much. He replied: "It is her breeding: the English have sold short on her blood and must get it back again at any price." Then it dawned on us that it was not only the cow which the Earl Bective bought: it was the men in the cow! And from that day to this we have never seen a famous purebred without seeing also the men in it. And that, it seems to us, is the proper attitude of mind for every beginner to conceive and for every experienced man to remember. And when one thinks that he is not merely buying purebred bulls or cows, horses, hogs, sheep, goats or poultry, but is really buying men, he can understand why in some cases long figures are reasonable. But no one is justified in buying or selling men at any price unless he has worthy motives. To sell men, in the form of their achievements with purebred animals, in such a way that their sale shall help other men to reasonable and dependable industry, embodies a noble motive: all forms of jockeying are otherwise.

And if you can rightly see the men in the purebred animal what can you see in the scrub? It is a fanciful notion, we admit, but the contrast of ideas always causes us to see the bear or the wolf in the scrub. It may be the "call of the wild," perhaps, but it is always a real emotion with us. And yet the scrub is not even a decent wild animal, for wild animals are "purebred" in their way. They have forms and characters which are the result of "natural selection." They can live and rear their young and, to meet nature's requirements, they are par excellence. If they do not reach this standard they die on the way and inefficiency is thus selected out of being. The man-made purebred is the result of "intelligent selection" and evil dies out of them by the operation. The wild type and the purebred type are, in a way, the same in creative process and attained efficiency, but they are at opposite ends of the line. Between the two ends is the whole multitude of scrubs and grades—working one way or the other according to the "wisdom and skill of the man who makes them—but worse than both, if judged by the standards of both. They are bundles of conflicting heredities. Left to themselves and bred among themselves without selection they follow the alleged tendency of earthly things and go to the devil. Turned loose, under proper environment, nature will work them over into decent wild things. Protected from each other and kept under the formative influence of purebreds they have in some cases become eligible to registry. Unless their owner does this with them, working always with selection and the best regenerating agency, they will rob him of his substance like a bear or a wolf, and this is probably why we always

think of these animals when we see a scrub. The wildling is the work of nature: the purebred is the work of man: the undisturbed, inbred scrub is an offense both to nature and man. There is nothing new about all this. Jacob knew it when he misled the cattle of Laban. The sad thing about it is that, not trying to know it and act upon it, or scoffing at it, retains, even to the present day, the power to keep men poor.

According to J. Leroy Nickel, President of the Miller & Lux Corporation, the big 90,000 and 100,000 acre cattle ranches in the heart of the San Joaquin valley are to be broken up and sold in small

tracts to actual settlers.

Purebred Registered HOLSTEIN CATTLE

One of the greatest investigations among dairy breeds was made by experts of the Wisconsin Experiment Station. Prof. F. W. Woll states that the "Holstein cows produced considerably more milk solids and fat than the cows of other breeds (19.5 per cent more butterfat than the Guernseys and 38 per cent more than the Jerseys), and they also give larger net returns for feed consumed." In all dairy breed competitions where Holsteins entered have been representative, they have produced a greater net profit for butter than any other breed entered. There's big money in the big "Black and White" Holsteins.

SILAGE FROM SUGAR BEET TOPS.

To the Editor: Do you consider sugar beet tops good material to make silage out of, or would it be best to mix it with green alfalfa or corn? I mean to cut it with a feed cutter and put it in the silo for feed for dairy cows.—J. H. Co., San Jose.

[Answered by Prof. F. W. Woll, Univ. Farm, Davis, Cal.]

Sugar beet tops are siloed regularly in European beet-growing sections, and the silage is fed to dairy cows and fattening cattle during the winter months. The tops make a slimy, rank-smelling silage, which is, however, greatly relished by cattle. Besides furnishing succulence to the ration, it apparently acts as an appetizer, something like limburger to people who are fond of this cheese. As beet tops contain nearly 80 per cent of water, they cannot be mixed with other watery feeds and make good silage. It was found, however, in an experiment conducted some years ago at the Wisconsin Station, that beet tops and dry corn stalks, run through a feed cutter and placed in a silo, will make a fair quality of silage. But it is not likely that a similar result would be obtained with green alfalfa or green corn and beet tops. Either of these crops may be all right for silage purposes with beet tops if cut at an advanced stage of maturity or if left to wilt before being put into the silo, but I know of no one who has made silage from a mixture of these crops, nor has beet tops alone been siloed in tall American silos to my knowledge. In Europe, the tops are put in long shallow trenches in the field and covered with straw and dirt, a method that involves large losses of feed materials through fermentations and decay, but the resulting silage, as suggested, is a valuable dairy feed, even though it might not meet the approval of our sanitary inspectors.

FEEDING FROSTED SUDAN GRASS.

To the Editor: Is there any danger at all in pasturing a heavy growth of Sudan grass after it has been killed by frost? Is it a sorghum and does it ever sprout from its old root?—W. I. K. F., Ripon.

[Answered by Prof. F. W. Woll, Univ. Farm, Davis, Cal.]

Sudan grass has only recently been introduced into this country, and we have no information as to whether or not the green grass is likely to be poisonous under similar conditions and to the same extent as other varieties of the sorghum family. It is, therefore, better to be on the safe side and not feed it under conditions when green sorghums should not be fed, i. e., when the growth of the crop has been stunted either through frost or periods of severe drouth. It is the new shoots that grow up in such cases that may contain prussic acid and therefore be poisonous to stock. This does not always happen under the conditions stated, but in case of doubt the safer method is either to pasture only one or two animals on the grass for a short time and to watch them carefully, or to cut the crop for hay or for the silo. So far as I know, there is no evidence that hay or silage made from any of the plants of the sorghum family cannot always be fed to stock with safety.

Live Stock and Dairy Notes.

[Livestock breeders all over the State are invited to send on postal cards, notes regarding their sales, State and County Fair intentions, new stock, etc.]

DAIRYING AND DAIRYMEN.

The Imperial Valley Creamery is shipping to New York butter in carload lots.

R. T. Walker of Fallon, Nev., has purchased the 2-year-old bull Napa King Segis Korndyke of Dr. Stetson, Napa, Cal.

Roland Hill of Bakersfield bought 500 cows in Nevada about Sept. 10. They are crossbred Herefords and Shorthorns.

The Henderson Company of Sacramento has recently sold to a Hawaiian Island company 10 head of grade Holstein cows.

Joe Scott has shipped his dairy cows to Lovelock, Nev. Winnemucca will be supplied with milk and cream from this dairy.

The great administration sale of Herefords, at Tarkio, Mo., to close out the partnership estate of Rankin and Lynn, took place October 9 and 10.

Of the 944 cows tested during September for members of the Stanislaus Cow Testing Ass'n, 61 won a place on the honor roll by reaching a production of 1.5 pounds of butterfat a day.

A co-operative cow testing association will be organized in Nevada to determine the profitability or unprofitability of every dairy animal in the association.

El Dorado county ranchers are preparing to test the new pasteurization law. They claim it works a hardship to the small dairy owners in such counties as El Dorado.

The workings of the new dairy law makes no appreciable difference to the many dairies in San Joaquin county. Most of the dairymen produce cream, and their product is cared for at the creamery.

Mr. Jorgensen of the Riverdale Co-operative Creamery informed us that they were doing twice the amount of business this year that they did last. He looks for good butterfat prices to continue all winter.

The Gridley district has just received a carload of thoroughbred Holstein cattle of the very highest breeding. Seven of the animals were for M. McBride of Los Molinos, 11 for S. A. Mealey, and one for D. G. Beale of Gridley.

The grand champion cow, Valet's Golden Biddie L., presented Mr. N. H. Locke with a beautiful heifer calf at the Fresno District Fair. Hundreds were attracted to the pen to see the calf and its proud blue-ribbon mother. The sire was Valet's King, owned by Mr. Locke.

Fern Silver Ray, a Jersey owned by Mr. Vanderpool of Imperial Valley, has just completed an official test for a year. Her production of 702.22 pounds of butterfat for the period equals the State record for butterfat production by Jerseys. Her total production of milk was 12,637.9 pounds, with an average test of 5.556.

SWINE AND SWINEMEN.

O. L. Linn, secretary of the Poland-China Breeders' Association of Northern San Joaquin, received recently by Wells Fargo Express a 650-pound Poland-China boar.

F. D. Campbell of Tulare shipped two carloads of hogs lately to the Los Angeles market, and W. R. Belknap of the same place shipped one carload of hogs to Anaheim.

The Pacific Acreage Co. of Caruthers have 1,000 hogs on the ranch. They are fattening a carload lot now to ship to market. With barley at \$2 a hundred they find it hard to fatten them at a profit, even with prices as they are.

Tagus Ranch, N. H. Locke Co. and J. E. Thorp are northern Cali-

fornia breeders who made the trip to the Riverside fair being held this week. Early in the week it was predicted that the hog show there would surpass all past attempts in southern California.

W. Hough of the Western Meat Co. stated at the annual meeting of the California State Swine Breeders' Association that his company had killed 85,000 head of hogs up to September 1 this year. In 1914 the total number killed by this company during the year was 42,000 while in 1915 they killed 85,000. This, he thinks, shows the way pork production is increasing in California.

SHEEP.

The number of sheep in Imperial Valley increased from 6,221 in 1913 to 35,843 in 1916.

John McGlinchey of Livermore purchased 1,000 head of breeding ewes from Hayes & Devaney recently.

D. O. Lively purchased two fine Rambouillet lamb rams from Chas. Kimble of Hanford last week. They were shipped to a customer in Oregon.

Overfeeding of barley followed by the drinking of a large quantity of water caused the death of 150 sheep and sickness of as many more at the W. A. Ash ranch near Colusa last week.

Bullard Bros. of Woodland have received reports from their shepherd, who is making the Texas fair circuit, that there is a heavy demand for Rambouillet sheep all through that State at present.

Chas. Kimble of Hanford has recently filled a six carload order of Rambouillet bucks from his large flock consisting of 581 head. The shipment was made to fill an out-of-State order, Mr. Kimble finding a good demand from both the southwest and the northwest this season.

Jones Bros. of Woodland have acquired the N. O. Brown, Turlock, herd of thoroughbred Shropshires purchased last year from the well-known Knowlin & Finch herds in Idaho. Fourteen of the herd of 114 are registered and include one imported buck and a second buck that took third prize in Shropshire entries at the Exposition a year ago.

HOLSTEIN ASSOCIATION TO CONDUCT SALE.

[Written for Pacific Rural Press.]

That the selling of purebred livestock under the auspices of a State-wide association is a thoroughly constructive and satisfactory method is indicated by the announcement of the California Holstein Breeders' Association that it will hold its third annual sale at Hanford, October 18.

As the original intention of the association in holding these annual sales was to afford beginners an opportunity of purchasing foundation stock at breeders' prices, extraordinary high prices are not expected at the coming sale, although included in the 100 head to be sold are some of the best Holsteins that will go through an auction ring this year.

Consignments have been made this year by eight of the older and larger Holstein breeders of the State, all of whom have taken great pains to see that their offering was fully up to the standard set by the two previous sales.

This year's sale is being conducted and managed by the breeders themselves, not so much with the hope of securing high averages as with the desire to perpetuate the association sale idea, and for that reason buyers will doubtless be well satisfied with the cattle sold and the prices they bring.

LIVESTOCK DIRECTORY.

Rates in this directory, 3c per word each issue; or if carried weekly for one year, 2 1/2c per word.

SWINE.

Poland Chinas.

SMITH'S POLAND-CHINAS—Sows and gilts bred to Joker, First Prize Boar at the Wisconsin State Fair, 1915. These sows and gilts, sired by Iowa Wonder, who is a son of A Wonder, the most celebrated Poland-China boar, living or dead. Litters from this mating are the best I have ever seen anywhere. Prices low quality considered. Will sell one or a carload. As a special inducement each purchaser will be given a year's subscription to the American Swineherd, the best swine paper published and a copy of the Handbook on the Sow; also a copy of the Pig Feeders' Manual. Geo. A. Smith, Corcoran, Cal.

YOUNG POLAND CHINAS, LARGE TYPE—Boar IBA Wonder won first and Reserve Championship P. P. I. E., weighing 730 pounds under 2 years and in breeding condition. 60-day special—fine young sows bred to IBA Wonder at very low prices; also weanling pigs, either sex. Satisfaction, or money refunded. W. A. Young, Lodi, Cal.

SONS AND DAUGHTERS of Laurel Champion. Won three first prizes, two championships, and both grand championships at the 1916 Nevada State Fair. Winona Ranch, Route 1, A-Box 105, Grant's Pass, Ore. P. R. Steel.

GRAND CHAMPION SUPERBA POLANDS—A few choice spring Superba boars ready for service. Sows bred to Superba for fall litters. Prices reasonably low. Rough's Greenfields, Arlington Station, Riverside, Cal.

POLAND-CHINAS—Bred gilts, \$15; young boars, \$10 and \$15; bred sows, \$25. Weanlings, either sex, \$6. Registered and crated, purchaser to return crates. E. A. Hall, Watsonville, Cal.

REGISTERED POLAND-CHINAS—Prolific, pabulous, profitable porkers. Choice boars now ready for service, \$25 each. Weanlings, \$15. Dr. J. A. Crawshaw, Hanford, Cal.

LAKEVIEW STOCK FARM POLAND CHINAS are money-makers. Satisfaction or money refunded. Geo. V. Beckman & Sons, Lodi, Cal.

BIG-TYPE POLAND CHINAS—Stock from the best herds of the Middle West. N. Hauck, Alton, Humboldt Co., Cal.

POLAND CHINAS—Big type. Shoats, either sex, or in unrelated pairs. O. L. Linn, Linview, Route A, Modesto, Cal.

POLAND-CHINAS—Big type combined with quality. Choice bred sows, gilts, boars. W. D. Trehwhitt, Box 82A, Hanford, Cal.

REGISTERED POLAND CHINA SWINE—Prize-winners. Finest stock in the State. \$20 up. M. Bassett, Hanford, Cal.

POLAND CHINA HOGS FOR SALE—Registration papers furnished free. C. A. Cooley, Durham, Cal.

REGISTERED POLAND-CHINAS and Duroc Jerseys. Cholera immune for life. T. H. Beckman, Lodi, Cal.

POLAND-CHINAS—Large type. The Browning Stock Farm. W. H. Browning, Woodland, Cal.

DEACON RANCH POLAND CHINAS—Prize winners. Young stock reasonable. Box 27A, Davis, Cal.

KNOB HILL STOCK FARM—Registered Poland-China Swine. A. M. Henry, Farmington, Cal.

REGISTERED POLAND-CHINA HOGS—J. A. Clark, R. 4, Lodi, Cal.

POLAND-CHINA HOGS—C. A. Stowe, Stockton, Cal.

REAOAKS RANCH herd of registered Poland Chinas. W. J. Hanna, Gilroy.

REGISTERED POLAND-CHINAS and Duroc Jerseys. M. F. Harrold, Orland.

POLAND-CHINAS—Prize-winners. Money-makers. W. Bernstein, Hanford, Cal.

Berkshires.

BERKSHIRE IMPORTATION—We want every prospective Berkshire buyer to see our new importation from the East before buying. A superior lot of sows are for sale. Many of them are bred to Iowa Champion Peer 2d, a boar that cost us \$750 at Iowa Fairs. He is a "big type" Berkshire of great quality. Iowa Fairs had him fitted to win at the San Francisco World's Fair, but were prevented from showing by the quarantine. We have sows of all ages, and boars for sale. One or a carload. Write to us. Butte City Ranch, Box F, Butte City, Glenn Co., Cal.

REGISTERED BERKSHIRES—World's Fair Grand Champion at the head of the herd. Also winners of Senior, Junior and Reserve Grand Championships. Stock of all ages for sale. Grapeville Farms, A. B. Humphrey, Prop., Escalon, San Joaquin Co., Cal.

FOR SALE—One Berkshire sow two years old and four pigs six weeks old. Sow and pigs registered. Will be sold cheap. Also one bay team, 5 and 7 years old, weight about 1250 each. T. Maher, Mountain View, Cal.

BERKSHIRES—I have one of the best herds on the Pacific Coast, including Grand Champion Sow, Reserve Grand Champion Boar under one year, Third Aged Boar, etc. Frank A. Brush, Santa Rosa, Cal.

SPECIAL—Six good service boars and a few sows in pig to Premier Leader due to farrow in October. Geo. M. York & Son, Berkshire breeders, Modesto, Cal.

REGISTERED BERKSHIRES—For sale, bred sows. Boars ready for service and weanling pigs. C. H. Thompson, Novato, Cal.

REGISTERED BERKSHIRES of prize-winning blood. Write for description and photos. Imperial Stock Farm, Morgan Hill, Cal.

ROSCROFT BERKSHIRES—Rivals Champion Best blood. Open and bred gilts. Service boars. F. L. Hall, Perris, Cal.

BERKSHIRES—Four service boars, 30 Spring 1916 open gilts for sale. Oak Grove Farm, Box 1, Woodland, Cal.

REGISTERED BERKSHIRES—Weanling pigs, \$10 each. G. A. Casey, R. 7, San Jose.

CHAS. GOODMAN—Breeder of high-class Berkshire Swine. Williams, Cal.

30 REGISTERED BERKSHIRES—Bears and gilts for sale. J. H. Benedict, Lemoore, Kings county.

REGISTERED BERKSHIRES—Bred sows. Also a few gilts. G. E. Sheldford, Healdsburg, Cal.

HOPLAND STOCK FARM—Registered Berkshires. Prices on application. Hopland, Cal.

BERKSHIRES—Carruthers Farms, Mayfield, Cal. Second annual sale, August 1, 1917.

REGISTERED BERKSHIRES—Young stock for sale. F. W. White, Elk Grove, Cal.

Duroc-Jerseys.

DUROC JERSEYS—My hogs were highest honors at State Fair, taking first prize herd, first prize sow, second prize boar. Were the largest of their age exhibited. Stock all ages for sale. Prices reasonable. Breeding and satisfaction guaranteed. Haden Smith, Route 1, Box 84D, Woodland.

DUROCS from River Bend Farm, St. Helena, Cal., are large type, smooth, rangy, with fine backs and deep cherry color. We sell only those we'd like to keep in our herd. Don't write us if you want cheap stock.

DUROCS and BERKSHIRES for sale, reasonable. First premium Berkshire boar and 3rd on Duroc, the only two hogs we entered State Fair, 1916. Perkins & Co., Perkins, Cal.

RANCHO RUBIUS DUROCS—A few choice gilts bred for October farrowing; also good service boars, tried sow and weaned pigs, priced right. Elmer Lamb, Ceres, Cal.

REGISTERED DUROC-JERSEYS—Service boars from prize-winning stock are money makers. They grow faster. New England California Corporation, Ripon, Cal.

DUROC JERSEYS—Herd boars. E. N. Colonel and Tulare Boy. Sweetest stake winner at Fresno, 1915. Choice breeding stock. J. P. Walker, Visalia.

DUROC-JERSEY SWINE—Bred gilts, open gilts, one good service boar and a few young boars for sale. T. J. Walker, Perkins, Cal.

REGISTERED DUROC-JERSEY SWINE—Both sexes, Big-boned type. B. F. Kendall, Hardwick.

REGISTERED DUROCS of guaranteed breeding. All ages. Weaned pigs, \$10. E. H. Boulder & Son, Napa.

REGISTERED DUROCS—Crimson Wonder stock. Young stock, both sexes. L. D. Collins, Denair, Cal.

WINTON DUROC-JERSEY FARM, Winton, Cal.—High class pure-bred hogs, both sexes, any age.

REGISTERED DUROCS from best Eastern blood lines. S. S. Southworth, Napa.

CURTIS DUROCS of either sex at all times. E. C. Curtis, Napa, Cal.

REGISTERED DUROC JERSEY SWINE—Frederick M. Johnson Napa, Cal.

REGISTERED DUROCS—All ages. Either sex. W. A. Pack, Hollister, Cal.

REGISTERED DUROC-JERSEY SWINE—D. L. Henley, Lemoore, Cal.

Other Breeds.

BILLIKEN HERD OF IMPROVED CHESTERS—Prize winners at the State Fair. The Farmer's Utility breed. Size combined with quality; producers of big uniform litters of growling pigs. 15 bred gilts due to farrow in Jan. boars and sows of spring farrows; first class and extra well developed; best blood lines obtainable; prices reasonable and every one cholera immune. Write for special prices and circulars. C. B. Cunningham, Mills, Cal.

CROLEY'S BALANCED PIG FEED for growing youngsters; also cheaper hog feeds for big hogs. Geo. H. Croley Co., Inc., 681-697 Brannan St., San Francisco.

LARGE YORKSHIRE SWINE—Gilts to farrow in September and October. Service boars and Spring pigs. Both sexes. Riverina Farms, Paradise Road, Modesto, Cal.

LITTLE BLACK ESSEX—Service boars and weanlings. Only herd in the State. Limited supply. Yolo Essex Herd, L. W. Millsap, Yolo, Cal.

LARGE YORKSHIRES—The ideal hog for the progressive farmer. Young stock for sale. A. L. Tubbs Co., Calistoga, Cal.

REGISTERED IMPROVED CHESTER Whites—Grizzly Bear Ranch, East Auburn, Cal.

DAIRY CATTLE.

Holsteins.

FOR SALE—An extra fine lot of 12 Registered Holstein Heifers from 8 to 18 months old. Some are bred to Prince Jahama Walker, a First Prize son of Prince Galscho Walker. Also an extra well-bred Korndyke bull to go with them whose granddam was a former world's record cow. This stock is priced low for a quick sale. Write, or better, come and see them at once. Geo. A. Smith, Corcoran.

REGISTERED HOLSTEIN BULL CALVES—Sired by Lorena Korndyke Alcarra, whose dam made 29.75 pounds butter fat in seven days as a four-year-old. J. M. Campbell, McCalon, Cal.

REGISTERED HOLSTEINS—Grandsons of King Segis and of world's record cow Creamelle Vale. Will build up the production and value of your herd. Write or call and see them. F. H. Stenzel, San Lorenzo, Cal.

REGISTERED HOLSTEINS—Have a few Bulls from El Prado Wayne Celantha, whose dams and sire's dams average per cent fat 4.1 years is 6.01. See my stock at the State Fair. J. W. Benoit, Route C, Modesto, Cal.

REGISTERED HOLSTEINS—Sired by King Korndyke Hengerveld Ormsby 53822. Dam Pieterje Maid Ormsby 78061, world's record when made 35.50. Send for pedigrees. Geo. Koumas, Modesto, Cal.

TULARE GUERNSEY AND HOLSTEIN FARM is offering young bulls of both breeds. Excellent breeding. Prices reasonable. W. J. Hixon, Tulare, Cal.

THE MCLOUD RIVER LUMBER CO., McCloud, Cal.—High-class thoroughbred Holstein bulls for sale. Write for prices and pedigrees.

A SPLENDID 8-months-old Holstein bull with good A. R. O. breeding for \$135. K. W. Abbott, Milpitas, Cal.

BREEDERS OF REGISTERED HOLSTEIN cattle and Berkshire pigs. Whittier State School, Whittier, Cal.

Write for terms. 216 Hobart Bldg., San Francisco.

CROLEY'S CALF FEED with skim milk will raise fine dairy heifers cheaply. Geo. H. Croley Co., Inc., 631-637 Brannan St., San Francisco.

ANNUAL LIVE STOCK SHOW FOR LOS ANGELES.

A movement is on foot headed by Walter P. Story, president of the Sixth District Agricultural Association, looking toward the establishment in Los Angeles of an annual live stock show and fair. At the instigation of Mr. Story, a meeting of 100 leading citizens was held recently in Exposition Park; and after discussion, a resolution was adopted calling on all civic, commercial, and industrial organizations to co-operate with the association in this movement.

Frank Wiggins, secretary of the Chamber of Commerce, advocated the step. He said the wonderful development of the Imperial Valley as a livestock country is again turning attention to stock-raising as a profitable industry.

STATEMENT OF THE OWNERSHIP, MANAGEMENT, CIRCULATION, ETC., REQUIRED BY THE ACT OF CONGRESS OF AUGUST 24, 1912.

Of Pacific Rural Press, published weekly at San Francisco for October 1, 1916, in the State of California, County of San Francisco, ss.

Before me, a notary public in and for the State and county aforesaid, personally appeared Frank Honeywell, who, having been duly sworn according to law, deposes and says that he is the Publisher of the Pacific Rural Press, and that the following is, to the best of his knowledge and belief, a true statement of the ownership, management (and if a daily paper, the circulation), etc., of the aforesaid publication for the date shown in the above caption, required by the Act of August 24, 1912, embodied in section 443, Postal Laws and Regulations, printed on the reverse of this form, to wit:

1. That the names and addresses of the publisher, editor, managing editor, and business managers are: Publisher, Frank Honeywell, San Francisco; Editor, E. J. Wickson, Berkeley; Business Manager, Frank Honeywell, San Francisco.

2. That the owners are (Give names and addresses of individual owners, or, if a corporation, give its name and the names and addresses of stockholders owning or holding 1 per cent or more of the total amount of stock): Frank Honeywell, San Francisco.

3. That the known bondholders, mortgagees, and other security holders owning or holding 1 per cent or more of total amount of bonds, mortgages, or other securities are: (If there are none, so state.) None.

4. That the two paragraphs next above, giving the names of the owners, stockholders, and security holders, if any, contain not only the list of stockholders and security-holders as they appear upon the books of the company, but also, in cases where the stockholder or security holder appears upon the books of the company as trustee or in any other fiduciary relation, the name of the person or corporation for whom such trustee is acting, is given; also, that the said two paragraphs contain statements embracing affiant's full knowledge and belief as to the circumstances and conditions under which stockholders and security holders who do not appear upon the books of the company as trustees, hold stock and securities in a capacity other than that of a bona fide owner; and this affiant has no reason to believe that any other person, association, or corporation has any interest direct or indirect in the said stock, bonds, or other securities than as so stated by him.

FRANK HONEYWELL.
(Signature of Publisher.)
Sworn to and subscribed before me this 29th day of September, 1916.

Notary Public, in and for the City and County of San Francisco, State of California.
(My commission expires May 26, 1916.)

SAN FRANCISCO LIVE-STOCK EXPORT Co., Eugene R. Croley, Manager, solicits foreign orders for purebred registered and merit breeding animals and fowls. California has great diversity of climatic and other conditions that enable us to select animals that have been raised under conditions similar to those of the location for which they are intended. We should be informed regarding these conditions and be allowed ample time to make selections. Nearly all disappointments in buying afar are the result of insufficient information as to conditions or to lack of time for proper selection. Our plan and terms for "raising animals to order" to fit into peculiar foreign conditions is worth investigating. References: Dun or Bradstreets, or San Francisco banks. Office 219 Underwood Building, 525 Market St., San Francisco.

DUROCS AND GUERNSEY BULL CALVES sired to 900-lb. boar. Ed. E. Johnson, Turlock. Cal.

THOROUGHbred SCOTCH COLLIES—All bred from our noted prize-winners. Have a few 3 months old puppies—very choice. Write us what you want. Browndale Kennels, Redwood City, Cal.

HERE IS YOUR LAST CHANCE

To Order an

Ideal Green Feed Silo

and get it up in time to fill with the last crop of alfalfa, which can be fed out in time to again fill in the spring with the first cutting, which as hay is hardly worth handling, but which makes excellent silage.

YOU CAN THEN FEED SILAGE through the summer and have the silo empty in time to fill with corn next fall.

MANY DAIRYMEN TRIED THIS PLAN last year and saved enough to pay for their silo. You can do as well.

DON'T DELAY BUT ORDER NOW.
If desired, terms can be arranged.

The Light Running

Acme Feed Cutter and Silo Filler

Built in Seven Sizes.

ALL STEEL FRAME
LOW FEED TABLE
MALLEABLE KNIFE HEAD
POSITIVE SAFETY DEVICE

TRIPLE FRAME CONSTRUCTION
ACCURATE KNIFE ADJUSTMENT
AUTOMATIC FEEDING DEVICE
REVERSIBLE FEED ROLLERS

Independent Control of Blower & Cutter Head Speed.

THE ACME ALFALFA MEAL ATTACHMENT

can be fitted to all sizes of Acme Feed Cutters. This attachment will enable the making of an excellent grade of alfalfa meal from alfalfa hay at a cost not exceeding that for baling.

CUT OUT THE MILL FEED EXPENSE BILL

Tulare, Cal.

Saves Expense in Modoc County Dairy.

[Written for Pacific Rural Press by W. D. Guthrie.]

It is a common sight to see on our western dairy farms, large milking barns, expensive to build and to keep clean and in repair. The Patterson Ranch at Cedarville, Modoc county, has solved the problem for itself.

They, like many others, put up first a barn that cost close to \$5000. At first, all the milking was done in the old way by hand, but soon it was decided to put in milking machines. The air pipes for milking machines in this barn would in themselves be no small item, so it was decided to build in one end of the big barn a place to milk 12 head at a time, thus eliminating several hundred feet of air pipe.

The following is the way their present system was built, although Mr. Patterson states that they expect later to put up a separate building and use the entire present barn for feeding.

The big barn contained four strings of cows, two strings on each side, facing each other. The new system is installed in the wide space in the middle of the barn.

The milking stalls are 9 feet long and about 3½ feet wide with a stanchion in one end. They were built end to end in two rows of six each, with a four-foot alleyway between. Along each outside edge is also an alleyway, through which each cow reaches her separate stall. The outside of each stall is a bar fixed so it will swing outward from either end. One end is opened to let the cow in; the other to let her out. The cows, as milked, are placed in a

different pen than those yet to be milked. Thus, the cows enter at one end of the alleyway and leave at the other.

The four-foot center alleyway is three feet lower than where the cows stand. This allows the milkers to put the machines on the cows without the usual stooping. Single unit machines are used. As soon as one cow is milked, the machine is put on the cow on the opposite side of the milking alleyway. An attendant then lets the first cow out, and places another in her stall. The machines are not carried. They hang all the time on scales. Thus, it is an easy matter to weigh the milk. A chart is conveniently placed on which the amount of milk may be jotted down. The milk weighing has heretofore been inconvenient with the heavy machine buckets.

Each cow has a number fastened to her neck by a heavy wire. No cow that does not come up to the standard is kept in the herd. An attendant places a ten-gallon milk can beside each milker, into which the buckets are emptied. When it is filled, he removes them. A block with string attached is provided as a signal system between milker and attendant.

The stalls are provided with feed boxes; and if fed grain at all, are fed by the attendant as he places the cow in her stall. A drain is provided for each stall.

The advantages of this method are as noted: inexpensive to build, easy to keep clean, more convenient for the milkers, and most important of all—handy to keep milk records.

Prince Gelse Walker, One of the Greatest and Best Bred Young Sires in the West. A Number of His Sons will be Sold at the First Annual Sale at the Santa Anita Rancho, October 23, 1916.

18-Year Grade Gives 635 Pounds Fat.

[Written for Pacific Rural Press.]

Gold Dust is the record cow in the John Hansen record herd of 80 grade Jerseys. They hold the State record for butterfat production by grade cows, having produced during 1915 an average of over 427 pounds of fat.

The records of the Ferndale Cow Testing Association show that Gold Dust headed the herd with 635 pounds of fat to her credit. Her milk averaged 6.3 per cent fat.

Now the fact that a grade cow would produce so heavily, is in itself an achievement worth recording; but it is still more interesting to know that this cow was 18 years old when she started the year's test.

Gold Dust, according to Mr. Hansen, is the result of a second or third cross of purebred Jersey sires on grade Durham cows. In color she resembles the Jersey. In size she apparently combines Durham characteristics, as she is larger than the other cows in the herd which carry close to 100 per cent Jersey blood. Needless to say heifers out of this cow and sired by purebred bulls are never sold from the Hansen herd.

S. S. Mitchell, whose ranch is on Upper Mill Creek near Healdsburg, has sold a carload of Angora goats to C. W. Burgess near Ione, Amador county.

Insure your feed supply against early frost and rain with

REMCO SILOS

The early cessation of the rains last spring and their unusually early opening this fall should be a warning to all feeders of livestock, especially dairymen, to no longer neglect the addition of silos to their equipment.

It is not yet too late to order a Remco silo to save your crop of corn from the frosts likely to follow the early rains, or to save your last cutting of alfalfa.

A Remco silo is your cheapest insurance against all such losses. Send in your order early and avoid delay.

Prince Alcartra Korndyke, Best bred son of Tilly Alcartra.

At prices within reach of every Breeder and Dairyman.

When you buy a son of our herd sire, Prince Alcartra Korndyke, you get more than a Holstein bull with registration papers—you get a grandson of the world's greatest milk cow out of a high-testing A. R. O. dam. Our herd of females has been developed into one of the best in the State.

Our supply of these young sires is always limited, but we have a few now which we are offering at very reasonable prices.

Write us at once, or call and see the herd.

State Swine Breeders Meet.

[Written for Pacific Rural Press.]

Greeted by Kings county people in a manner that could not be excelled in cordiality and good fellowship, the California State Swine Breeders' Association held their fourth annual meeting at Hanford, October 9.

The night before an elaborate banquet, attended by close to 175 persons, was tendered by Kings county boosters to visiting members. Addresses were made principally along marketing lines by W. E. Hough of San Francisco, H. L. Kelley and Frank Hauser of Los Angeles, D. O. Lively and J. L. Thatcher.

At the day meeting following the banquet, the market situation was still further discussed, the packing house representatives maintaining that there is not as yet in California a sufficient number of farmers who breed good hogs and then feed them properly. As a result of this they say they are unable to pay as high prices as are paid by the Eastern packers.

This point was again made by

Frank Hauser in comparing a grade hog with a purebred that was on exhibition at the fair grounds. There he showed how the purebred had less waste and more high-priced meat than the grade, which naturally allows the packer to pay more money for him.

Despite these arguments, the feeling was prevalent among growers present that there is something radically wrong with present marketing facilities and this was strongly brought out by Chas. Kimble and others present. The meeting undoubtedly accomplished much good as it brought grower and buyer closer together than they have been in the past.

At the request of delegates from southern California it was voted to hold next year's convention at Los Angeles, where it is planned to hold a swine show in connection some time in January. The packers present promised to give their support to the convention and help in entertaining visiting delegates.

NEVADA GETTING GOOD PUREBRED COWS AND HOGS.

[Written for Pacific Rural Press.]

[Note.—One of the few purebred livestock breeders, and one to whom everyone refers as one of the most progressive breeders of Holsteins and Poland Chinas in Western Nevada, is Dr. E. H. Hawkins, of Gardnerville. We asked him to give us the breeding of his stock and we print most of it below in his own words.]

I started my present herd of purebred Holstein-Friesian cattle by purchasing a bull calf,—Prince Gem Pontiac de Kol—from A. Jensen, Gardnerville, Nevada, April 10, 1914. I then bought two bred heifers from Chas. L. Fulstone, Carson City, Nev., Jan. 7, 1915. Since that time, I have been gradually increasing my herd, and today have twenty-one purebred females and three bulls.

My foundation cows are, Maud F. 3rd, 13 years of age. She made in Jan. 1916, butterfat, 14.936 in seven days.

The three following cows are her daughters. All have seven-day records and are on semi-official test: Lena De Kol Maud made 14.784 lbs. butterfat in seven days; Queen Maud Pauline made 8.675 lbs. fat as a two-year-old; not fitted; Lady De Kol Maud made 11.749 lbs. in seven days without any preparation.

Gem Beauty De Kol made 12.554 lbs. in seven days, but if she had been handled right, should have made at least twenty pounds. Holland Cayvan De Kol made 19.29 lbs. butterfat in seven days, and is now on semi-official test. She will make a thirty-pound cow.

I have recently purchased Gem Pontiac Ruby Burke De Kol, Holland Pontiac Burke De Kol, and Holland Pontiac De Kol, from William Gray of this place. They will freshen in the spring.

The herd also includes 10 heifers and heifer calves of high pure breeding.

I have recently purchased the bull, King Pontiac Ruby Burke 2nd,

and will put him at the head of the herd. Pontiac Burke De Kol will be my junior sire. He is a very promising calf, with some great blood lines behind him.

The Poland Chinas include the Big Type herd sires Joe Model and Big Joe's A Wonder Look. Joe Model weighs 500 pounds now at 1½ years old; and some of the sows of the same age weigh about the same.

There are nine brood sows of Wonder, Joe, Blue Valley, and Timm blood and a couple of young boars sired by Blue Valley and Big Timm. Blue Valley is a 1000-pound hog and his Nebraska owners refused \$1000 for him. Big Timm was Champion of Nebraska last year and weighed 1125 pounds at the time.

W. E. Premo of Porterville is fattening a few baby beeves.

Second Semi-Annual Sale

KINGS COUNTY POLAND CHINA BREEDERS ASS'N.

Will Be Held at the County Fair Grounds, Hanford, Cal.

Thursday, October 19, 1916

Good Stock Show at Hanford.

[Written for Pacific Rural Press.]

Hospitality, despite weather such as no California fair directorate has had to contend with, was the shining light at the Fourteenth Central California Fair held at Hanford last week.

Livestock was featured as has been the custom and previous to the opening of the gates on Tuesday the barns were full mostly with dairy cattle and swine many of which had become veteran winners at all of the 1916 shows, and these together with a strong showing from local herds combined in making a show of sterling quality.

The final lineup showed that Poland China hogs were in the commanding position largely due to the strength which that breed rightfully claims in Kings county. Surprises were frequent in the judging of this breed, the judge, A. L. Nelson of San Luis Obispo, placing the aged sow Silver Ruth, owned by Ross, in the Grand Championship class over a strong lot of females, and running the under year boar, Chief's Victor, shown by Bassett, into the Grand Champion boar honor after a combat with Long Nelson 2nd, first in the aged boar class shown by Trewhitt. Exhibitors were F. D. Ross, M. Bassett, W. D. Trewhitt, T. J. Gilkerson, H. I. Marsh, J. A. Crawshaw, Wm. Bernstein.

Durocs were shown by J. E. Thorp, Tagus Ranch, L. D. Collins, O. and C. Dimmick, J. K. Fraser. Repeating their previous performance all along the circuit, California's Defender shown by Fraser and Long Wonder's Queenie by Thorp, were outstanding winners of grand championship in boar and sow classes respectively.

Berkshires were shown by Normandy Farm and H. L. and E. H. Murphy, the Murphy herd carrying off grand championships in both male and female classes with Rival's Robinhood 2nd as the leader of the boars and Gay Princess 4th supreme among the females.

It was nip and tuck between the Holsteins and Jerseys as to which would lead in numbers in the dairy division with honors about even.

Of the two, Jerseys made a more consistent showing as their classes from top to bottom were more highly contested. From the start E. L. Westover of the Cal. Polytechnical College, who did the judging, showed a decided preference for the large rugged American type, picking the aged bull Borello Golden Laddie for first in class and later for grand championship. In the female cham-

pionship the heifer King's Carnation of L., also of the Locke herd, went above Valet's Foxy Blondy of L. in her class and finally above the aged cow Valet's Violet of L. for championship. Exhibitors were N. H. Locke Co., S. F. Williams, A. A. Jenkins, C. T. Star, R. E. Shore, J. E. Thorp, E. H. Church and Dr. Frank Griffith.

Holsteins were shown by T. J. Gilkerson, Tagus Ranch, F. D. Ross, Buena Vista Ranch, G. U. Clark and L. Y. Montgomery. Lack of fitting in this division held some nicely bred animals in the lower end of the line and some of the tops could have stood more bloom. Rose De Oro Sarcastic, an aged cow shown by Gilkerson, had an easy time of it in class, but was pushed for grand championship, which she finally won, by the junior champion heifer, Hazelwood Mercedes Ormsby Posch. The latter is of fine type but lacked somewhat in ruggedness for the purple ribbon. Her stable mate, River-view Bracelet Britt, was first in his class and later secured junior and grand champion ribbon for males.

A nice Ayrshire show was made by Steybrae Farm and Shorthorns were exhibited by Murphy Bros. A good jack and jennet show was staged by Jas. McCord and John Burrell, the former also exhibiting Shires without competition. The Tagus Ranch showed some of their newly acquired Percherons and Belgians, having to give way in the former division to Bassett, who showed the aged stallion Ithos with success.

BIG POLAND CHINA SALE AT HANFORD.

[Written for Pacific Rural Press.]

With consignments from all of the older and more important Poland China herds in Kings county at their disposal the managers of the second annual sale of the Kings County Poland China Breeders' Ass'n have catalogued what is undoubtedly the largest choice lot of Poland Chinas ever offered, for their sale October 19 at Hanford.

For several months preparations for this sale have been under way, breeders withdrawing from the market many outstanding animals in order that their consignment might be first class in every respect.

The tabulated pedigrees, which may be found in the catalog just issued, show a variety of breeding strong in the blood of show ring winners and this combined with the

good reputation of the breeders consigning insures the buying public a wonderful opportunity for the purchase of purebred hogs.

The association has made arrangements for a banquet to visitors, the night preceding the sale

and will do everything possible to insure visitors a joyous time.

Louis Hestorff of Salinas recently shipped from Rosewood, near Stockton, 176 head of fine horses to Denver, Colo.

AUCTION

750 Horses and Mules

OCTOBER 19-20, 1916

By order of the E. Clemens Horst Company, we will sell five hundred horses, weighing from 1000 to 1400 pounds, and from three to six years old. Many are broken to saddle and harness. Also two hundred and fifty mules, seventy-five being two-year-olds, the balance from three to five years old. A large percentage of this young stock was raised by the Horst Company on their ranches in California and Oregon, and must be sold on account of being overstocked. A part of both the horses and mules will be graded and sold in carload lots.

Sale takes place at the Horst Company's ranch, three miles from Wheatland, Cal., at 10 a. m. Thursday and Friday, Oct. 19th and 20th. Autos will meet all trains, and buyers from a distance will have stock loaded on cars free of expense.

BASSETT'S POLAND CHINAS

GRAND CHAMPION SOW,
P. P. L. E. 1915; Sacramento 1916.

For many years, at widely separated show rings, under many different judges of varying type ideals, my Poland Chinas have been consistent prize-winners. My herd is large, and I cull closely. The animals sent out as breeders are the very tops of a large number. I KNOW that my kind of Poland China is a profitable farmer's hog, for I send carloads of them to the packer every year—uniform in size, high in quality, quickly and economically matured and finished. Young Stock, \$30 Up.
M. BASSETT,
Rr. 1, Hanford, Cal.

Mrs. Best's Letter.

My Dear Friends: Now at the first rain, we all think of shoes, rubbers, coats and umbrellas that have been forgotten during the summer months. Shoes particularly present themselves, for a perfectly good pair except for a wee hole in the sole seem suddenly old. White shoes and low shoes too seem woefully out of place and the school girl thinks of her elkskins in the closet or a pair she has contemplated as a necessity.

High boots, lacing up securely around the calf of the leg, with heavy soles and flat heels, when well-oiled are a comfort to any woman who has to be out in all kinds of weather and who dislikes the very inconvenient rubber. These boots wear and wear, standing many resolings and hard usage. One can wear them for tramping boots in the summer and for all kinds of wear in the winter if well oiled.

If for any reason, you feel you must have rubbers, the toe rubber that snaps on with a rubber band is much the most comfortable to wear and except for wading in mud answers every purpose. They last better than the old type, for usually it is the heel of a rubber that breaks first.

For dress shoes, the colored tops, fancy stitchings and strapped toe are as popular as they were in the summer and more so for many people, for they are now shown in a comfortable low heel accompanied by no loss of style.

The dressy slipper for evening wear is still high heeled—the flat heeled satin and kid slipper so popular two winters ago seems to have been forgotten by Dame Fashion, perhaps because being sensible all day in Kozy Klogs has a reaction in the frivolous dressy pump of the evening.

The general style of the smart appearing button or lace boot, pumps or slippers is flat, long and narrow and the woman with a short, plump foot has hard work to be in style.

Rosabella Best.

HALLOWE'EN.

One of the easiest and most informal times to have a party for either grown-ups or children is Halloween. Decorations are so easy to acquire, corn stalks, pumpkins and autumn leaves being the popular ones. Refreshments are simple and all the time-honored games like apple bobbing, throwing apple peels, catching an apple in the teeth, nut burning and the like are still popular and never lose their delight and charm.

If there is an open fireplace, popping of corn, and roasting of apples and chestnuts is an interesting occupation. With these have a dish of home-made candy. The delight of a Halloween party is in its informality and good cheer.

Clocks for the home are much smaller and less ornate, many of them set in simple mahogany cases.

Mirrors are very good style—any shape is good if the frame is simple.

Scrim and marquisette have very largely superseded net for curtains in moderate homes.

THE HOME CIRCLE

HOUSEHOLD RECIPES.

Grape Ketchup.—Three quarts of grapes, stemmed; two pounds of brown sugar, two cups of vinegar, one teaspoonful of cayenne pepper, two tablespoonfuls each of ground cinnamon, cloves and allspice and one tablespoonful of salt. Cook grapes, run through colander to remove seeds, add sugar, vinegar and spices. Boil until it thickens and seal while hot.

Grape Conserve.—Stem and seed white Muscat grapes and cook slowly until thick. Then add three-quarters of a cup of sugar to each cup of pulp and cook until it glazes or is reasonably solid. After it is cold add the broken meats of walnuts and put away in glasses or jars. Seedless grapes can be used, but being a little more watery, require more cooking. This is delicious with hot muffins or biscuits.

A Hallowe'en Cake.—For your Hallowe'en cake use as large a pan as you can procure with the hole in the center as for fruit cake. Make a simple cake batter and fill it with all sorts of small favors, as many as you have guests. These, beside the conventional trinkets for birth-

day cakes, should be toys that predict the future, as tiny boy dolls for a husband; a miniature automobile or airship to show such luxuries are coming; a pair of handcuffs, meaning jail; a ship, a trip abroad. Each favor is wrapped in paraffine paper and should contain a printed fortune.

When the cake is cold, ice with a bright orange icing and on the top and sides make witches, cats, crescents and bats from a dark chocolate frosting. The figures can be cut from paper and the outline marked with chocolate, later filled in.

When on the table, put a thick candle, either black or orange, in the hole in the center of the cake with a witch shade on top. As the cake is cut and served each one must read his future aloud. A very clever fake cake can be made by frosting a round hat box and decorating it with yellow jack-o'-lanterns and witches. It can be filled with small decorated cakes or with favors suitable to the occasion.

An empty baking powder can, with the top bent to a sharp angle, is fine for melting and pouring paraffine.

A pint pitcher is a handy filler for fruit jars.

Hang Out A Line Of Holeless Hosiery

When you hang up the stockings on wash day and find them hole-worn and torn, you realize that instead of your well-earned rest, you have an evening's darning ahead of you. There's no need of so much darning. Buy Durable Durham Hosiery for the whole family, and on wash day you'll hang out a line of holeless hosiery.

DURABLE DURHAM HOSEIERY

FOR MEN, WOMEN AND CHILDREN

is made right in the heart of the cotton district from the best yarn we can make. It has heavily reinforced heels, toes and soles—always fits snug after every washing, and the tops can't be jerked from the bottoms. Every pair is made strongest where the wear comes hardest.

Our location, economical manufacturing conditions, and the fact that we are the largest manufacturers of this class of hosiery in the world, enable us to sell superior hosiery for the low price of 10, 15 and 25 cents.

For best wear, buy
Durable Durham
25-cent Mercerized
Hosiery.

Durham Hosiery Mills
Durham, N. C.

Floral Department.

[By Geo. N. Tyler.]

Pelargoniums that are in pots and were cut back severely, in late August and early September will have made breaks or new growth about an inch long by this time. Knock them out of the pots and shake off all the old soil, prune back the straggly roots, and repot in pots one or two sizes smaller than they have been growing in. If in six-inch, pot in four; if in four, pot in three-inch. For pelargoniums use a good fibrous loam, with no manure added. Manure makes a long jointed soft growth. If you use any fertilizer, try bone meal, a five-inch pot full to a barrow load of soil. If your loam is too heavy add one-fourth fine sand or fine gravel. In potting press them firm, giving thorough drainage.

Chrysanthemums are now showing color, these early rains have spoiled a great many blooms. You can save a great many by shaking the water out of the half-expanded flowers as soon as it clears off. Diabroticas are very destructive to the mums, dahlias, and most all of the fall flowers. They seem to be more plentiful this fall than I have ever seen them. About the only thing you can do is to go over your blossoms two or three times a day and hand-pick them, dropping them into a can in which there is an inch of coal oil. Diabroticas look like lady bugs, but they are green covered with black spots, and are very destructive.

Carnations.—If you have a warm window or small greenhouse you can pot up field-grown carnations for winter and early spring bloom. Pot them in six-inch pots, using a rich compost, with one-fifth sand added. After potting and watering put in a shady place, free from draughts, for a week or ten days. Spray the foliage once or twice a day for a short time to prevent wilting. After they have recovered from the transplanting give them full sun and never let them dry out at the root. You can also plant them in boxes six inches deep and eight inches wide and as long as you wish.

The best varieties for winter blooming are Enchantress, light pink; Enchantress supreme, light pink with a tinge of salmon which prevents it from bleaching in the sun. White Enchantress, White Wonder, rose pink Enchantress, Mrs. C. W. Ward, rose pink, Benora variegated. These are all florists' forcing varieties and are fine winter and spring bloomers. Use lime in your compost for carnations.

THE RURAL HOT LUNCH.

The North Dakota Agricultural College has issued a new bulletin on the Rural Hot Lunch. This discusses the preparation and serving of a hot lunch in a rural school and points out the physical benefit to the children as well as the Domestic Science Training. If the planning of one hot dish a day seems too much for the teacher to assume, it is suggested that the mothers of the district would organize and plan the work from two to four weeks in advance. This would mean not only deciding upon the dish to be prepared, but the ingredients necessary and the quantity required.

GREEN HILLS AND WINDY WAYS.

Give me green rafters and the quiet hills
Where peace will mix a philter for my ills—
Rafters of cedar and of sycamore,
Where I can stretch out on the fragrant floor.
And see them peer—the softly stepping shapes—
By the still pool where hang the tart wild grapes.

There on the hills of summer let me lie
On the cool grass in friendship with the sky,
Let me lie three in love with earth and sun,
And wonder up at the light-foot winds that run,
Stirring the delicate edges of the trees,
And shaking down a music of the seas.

—Edwin Markham.

THE JOKE ON ELLEN ANN.

"In a tin pail!"

Cicely's voice was so astonished and horrified that it made mamma laugh.

"A nice, shiny tin pail," she amended. "Come and see your face in it. And that isn't all there is in it, either!"

There were crinkled tarts and delicate sandwiches and a little golden cup-custard, with one of Cicely's little silver spoons to eat it with. There was a twisty doughnut that looked like a man, and a little, round pie with C pricked into the crust.

"The inside's nice," admitted Cicely, admiringly. "But must I take it in a tin pail, mamma? I'd rather come 'way home—yes, I would—every single step! Nobody else but Ellen Ann Tibbetts carries a tin pail, and the boys all laugh at Ellen Ann. And, oh, dear, that pail is 'actly like Ellen Ann's, mamma! Hers is shiny, too."

Mamma was fitting on the cover. She looked rather sober now.

"A little girl who loses her pretty lunch-basket must carry her dinner in a tin pail, or—go without," she said gravely. "And maybe it will be good for her to learn how little Ellen Ann feels to be laughed at."

"I never laughed at her,—honest, mamma—'cept up my sleeve."

"Well, maybe now you won't laugh even there, dear. Now kiss me, and off with you!"

It was a beautiful morning, with sunshine enough in it to make two days. The pail-cover jingled a jolly little tune as Cicely walked; and the sun caught the shiny surface of it, and made it look like a silver cover.

Half through the morning somebody came for Ellen Ann Tibbetts to go right home, as her mother was sick. So there was only one tin pail in the dressing-room at noon recess. That comforted Cicely a good deal; for it would have been dreadful to see Ellen Ann eating out of a tin pail just like hers!

She took her shiny pail, and went out into the sunshine with it, thinking how "delicious" mamma's custard would taste, and how—

"Why!"

Cicely almost dropped the pail, but it wouldn't have spilled much if she had. It was nearly empty! There wasn't any custard or any silver spoon to eat it with! There wasn't any little round pie, with C on the cover! There wasn't anything, except just two lonesome

biscuits sliding round in the bottom!

"Why!" Cicely cried over again.

Then she knew what it meant. This was Ellen Ann's shiny pail. Ellen Ann had carried hers home.

"Well, she's mean!" cried Cicely, hotly. "I hope my custard an' my 'initial pie'll choke her—'most! Yes, I do! I'm most starved to pieces, and she didn't even leave any butter on her old biscuits!"

She went off all by herself, to be cross and hungry. It was ever so long before she would be sensible and stop trying to believe Ellen Ann had done it just to play a mean joke on her. It was ever so long before she took out the poor little butterless biscuits and looked at them pityingly.

Was that what Ellen Ann ate for lunches? And not any butter on 'em at all? Didn't she ever have any custards or tarts or twisty doughnuts? And never any little thin slices of pink ham in between?

It made Cicely so hungry to think about little thin slices of pink ham that she took a nibble of Ellen Ann's biscuit. Then she slowly dropped it back into the tin pail. Cicely would rather go without any dinner than eat bread without a speck of butter on it.

Poor Ellen Ann! Cicely hoped she would like the custard and the crinkly tarts,—yes, and even the initial pie! She suddenly remembered that Ellen Ann's father was an invalid, and Ellen Ann's mother "took in" house-cleaning and things.

And the patched places in Ellen Ann's clothes,—Cicely remembered those, too.

On the way home from school, what should peep out at Cicely from the bushes beside the "Half-way Spring" but a dainty little red-and-white lunch basket! Just where she'd left it to hunt for water-cresses!

She carried it home to mamma.

"But I want the tin pail, too, tomorrow, mamma—this tin pail. I'm going to play a joke on Ellen Ann Tibbetts," she said. And then she whispered to mamma, and mamma nodded to her. And the next day two dainty lunches went to school with Cicely, and one of them was in Ellen Ann's shiny tin pail.—Young People's Weekly.

Dirt and disease have something more in common than an alliterative affinity.

ARCADIAN MALLEABLE RANGE CO. Milwaukee, Wis. Dept. 19

This is Styleplus Week from Maine to California!

Styleplus Week from coast to coast, the country over! The week when the live-wire, hustling merchants are putting Styleplus suits and overcoats in their store windows for you to admire! The week when the up-and-doing men of the nation are buying their new winter clothes—Styleplus at the attractive and easy price—\$17. The price \$17 for such splendid fitting, splendid wearing clothes has always been remarkable. But right now it is an achievement without a parallel.

All wool or silk-and-wool fabrics in the latest attractive shades and patterns. The foundation (canvas and haircloth) is thoroughly shrunk in water for twenty-four hours. Fine substantial linings. Hand-tailoring in all the vital parts. Only silk thread is used throughout. A corps of famous designers fashion the models. Here are clothes of remarkable style and value, covered by a guarantee that makes you sure your money's safe! Visit the Styleplus Store today.

Style plus all-wool fabrics + perfect fit + easy price + guaranteed wear

**Styleplus \$17
Clothes**

"The same price the nation over."
(In other countries duty added)

You know the price before you go into the store—\$17 always, everywhere. Watch your local newspapers for advertisements of the nearest Styleplus Store. Look for Styleplus in the Store Window. Look for the Styleplus Label in the coat collar. If there should not be a Styleplus Store in your town, ask your favorite dealer to order a Styleplus suit or overcoat for you.

Good Health.

[By H. E. Pastor, M. D.]

Is Facial Expression Altered by Food?

The Daily Mirror of London declares that the human face is altered by the food we eat. If the writer had drawn on his observation instead of his imagination he might recall that children of the same family dining at the same table every meal for years, are not alike in facial expression. Of two sisters one may be sweet-faced the other sour-visaged; one a blonde, the other a decided brunette; one may be florid and robust, the other pale and anaemic; one will persist in remaining pudgy on a diet of stewed prunes and weak tea, and the other remain as thin as a tin shingle on a full diet of roast beef and plum pudding. The sheep and the hog graze in the same pasture; one grows wool and the other grows bristles. You can't make a black man white by feeding him skim milk, not a white man black by feeding him blackberry juice. Food is doubtless a modifying factor in altering physical expression, but a very small one compared with such determining factors as heredity, temperament, environment, etc. It is rank absurdity to talk of a "starch chin," "tea-drinker's teeth," "potato lip," etc. "Man is what he eats," the writer goes on to say. This claim is about as sensible as the claim made some years ago that music was capable of expressing every emotion, thought, and idea that language could. Ambrose Bierce, then writing for the San Francisco Examiner, said if that were true you might play the History of England on a piccolo. If these food faddists are correct, and a man aspires to be an Apollo, a Solomon, or a Michael Angelo, all he would need to do would be to pick out the right articles on the bill of fare. For science "as she is taught" the average daily newspaper contributor is in a class by himself—and herself. Some people become so hypnotized with a good idea that they let it run away with their good sense.

The Mineral Salts and Growing Children.

Last week a few words were said in this column on the value of certain mineral salts in bone-building in infants and young children. In this paragraph a few suggestions are offered as to the best way of obtaining these salts and of administering them where there is an obvious deficiency. It is said that the mother's milk is a perfect food for the suckling infant—and it is if the mother is in perfect health and is properly nourished. Unfortunately such is not always the case, and baby suffers in consequence. Or, perhaps, for one of several reasons, baby may have been brought up on cow's milk, which is not identical with the human secretion, and unless this substitute is properly modified, it fails to supply all the necessary elements of nutrition. Such a milk diet should be supplemented with one of the cereal foods, containing certain mineral salts which milk alone will not supply. Also, it should be noted, phosphate of lime, mentioned last week as being so im-

portant to bone formation, cannot be appropriated by the human system in its inorganic form, but must be organically bound up with food materials to be available for tissue-building in the child. The same may be said of the salts of iron, a natural constituent of the blood, for lack of which many babies and young children fed on a milk diet alone become pale and puny. Milk is deficient in iron. The best mode of administering these all-essential salts is in foods which chemists have shown us to be especially rich

in them. Foremost among these this writer would place the orange, about a teaspoonful of the juice for young children, either pure or diluted with a little water. Besides iron, the orange contains the salts of phosphorus, potassium, calcium (lime), and sodium, all of which serve a useful purpose in the human economy. Pears, apples, plums, cherries, apricots and figs also contain more or less of these salts, but none are so bland or so easily assimilated as the juice of the orange which, besides supplying these in-

dispensable salts, is antiseptic and antiscorbutic. Of the cereals, barley, oatmeal, or rice are to be preferred for growing children and in the order named. Of vegetables, rhubarb, celery carrots, onions, and potatoes fed in small amounts are all good, but the individual requirements and the idiosyncrasies of each child should be carefully studied and the dietary arranged accordingly. Study food values carefully and you will have less sickness in the family and fewer doctor bills.

We Must Add \$175 to the HUDSON SUPER-SIX

Here is an issue which we can't evade. So we meet it fairly and frankly, but give you a full month's warning. Every Super-Six will be sold at present prices while they last. If you can get one, get it.

The Super-Six of the present series is built from materials contracted last year. There are only 3500 more to go out, including open cars and enclosed. And part of them are sold.

The next production—starting December 1—will be like the present models. The changes, if any, will be only minor refinements. But materials for that series were contracted this year, and at prices enormously advanced.

So the cars now in process are the only Super-Sixes we can deliver at the present Hudson prices. The advance will be \$175 per car.

No Way Out

Most people know that Hudson profits are amazingly low for our output. Here is the top-place car—the largest-selling fine car in the world with a price above \$1100. Yet it sells way below some fine cars. Still our standards are so high that, despite our big output, profits are very small.

Now these high-grade materials, in one year, have enormously advanced. We must either adopt lower grades of materials, or add the advance to our price.

There is no other way out for fine-car makers whose profits have been fair. This enforced raise means no greater profit to us. So we frankly state the facts.

We shall continue the present-grade Hudson. Next year's models will be the same as this year's; save perhaps in some minor refinements. There will positively be no change in the Super-Six motor. So the added cost—and that alone—will be added to our price.

Good News for Owners

This will be good news for owners. About 25,000 have, or will get, Super-

Sixes at present prices. With this patented motor, where wear and friction are almost eliminated, depreciation is a trifle. And like cars, of the next production, will cost a great deal more. So a Super-Six can be bought now at a saving of \$175.

We have under way of the present production about 3500 cars. Part are open models, part enclosed. Many of them are sold.

But many Hudson dealers, suspecting the advance, have unsold Super-Sixes. If you get one now, you will save \$175. For all Hudson dealers will advance the Super-Six when we start production of the next series.

If you can get one now, go get it.

Next Year's Ruling Car

Next year, as this year, the Hudson Super-Six is certain to hold its supremacy. The Super-Six is controlled by our patents—the motor which added 80 per cent to efficiency. So other cars can't use it.

The Super-Six now holds all the worthwhile records. All the world's stock car records up to 100 miles. It holds the 24-hour record of 1819 miles. It won the Pike's Peak hill-climb—the world's greatest event of its kind.

In September it won the ocean-to-ocean record. It went from San Francisco to New York in 14 hours 59 minutes less time than the next best record.

It won all these records because of endurance. Because this invention has so nearly eliminated all friction, vibration and wear.

So every man who knows the facts must concede the Super-Six supremacy. Every test has proved it. If you want such a car—even for next year—now is the time to get it, if you can.

Hay.

Cars are almost unobtainable. Shipments and arrivals continue light, with further curtailment likely, as crops within reach of water transportation are cleaned up fairly well. No shortage here so far, demand light, except in fancy grades. Comparatively little grain hay appears to have been caught by rain, though considerable late cutting alfalfa has been lost. Alfalfa now in ample supply, and no advance anticipated. The grass which is now coming up everywhere is expected to greatly ease the situation in the country as many stockmen had been preparing to feed hay during early winter, and this will now be unnecessary.

[Wholesale prices per ton, carload lots, San Francisco.]

Winston-Salem, N. C.

Special Livestock Market Report.

San Francisco, October 11.

CATTLE—Despite the advancing season a good many cattle are being offered from California points. The bulk of receipts are, however, coming from Nevada with a few scattering lots arriving from Oregon. Prices remain unchanged.

SHEEP—There is no change in the local market, both sheep and lambs remaining steady, as last quoted. There is a slackening off in receipts of lambs as a result of the advancing season.

HOGS—A slight advance has been recorded in the price of lightweights, because of the falling off in receipts of that class. During the past week there have been some number one hogs arriving which earned a premium for the shippers on the dressing percentage basis. Prices quoted are made subject to the seller standing one-half of any loss on hogs condemned for disease by government inspectors.

Los Angeles, Oct. 10, 1916.

CATTLE—The market holds up very well. California and Nevada continue to use a fair number of very good grass cattle and they are selling without trouble at old prices. Fat cows

and heifers are also meeting with very fair sale. Quotations are f. o. b. Los Angeles:

Beef steers, prime, 1000 to 1100 lbs.\$7.00@7.75
Stockers and feeders5.50@6.00
Prime cows and heifers6.25@6.50
Good cows and heifers6.00@6.25

HOGS—The number of hogs coming in is very good for this time of year and altogether from California. More California hogs are being received than ever before and of better quality and they are selling a little more freely and are bringing steady prices. Idaho hogs continue to go east, being drawn there by high prices. We quote per cwt, f. o. b. Los Angeles:
Heavy, averaging 250@300 lbs.\$8.50@9.00
Mixed, 200@2509.00@9.25
Light, 175 @2009.00@9.25

SHEEP—A firm market was reported the past week, though prices are not quotably higher. California and Arizona furnished most of the supply, they found very good sale; killers all in the market and taking hold without hesitancy. Per head f. o. b. Los Angeles:
Prime wethers\$7.00@7.25
Prime ewes6.50@6.75
Yearlings6.50@7.00
Lambs6.50@7.00

CALVES—Receipts light and market firm and good for the few coming in. Selling at \$8.50 to \$9.50 per cwt.

North Portland, Ore., Oct. 9, 1916.

CATTLE—Today's cattle market opened with another large number of 1600 head. There was a large offering of inferior quality, steers and cows in the run, although there were a number of loads of good quality stuff. There were a few loads of prime steers sold at 7.25 with other loads from 6.75 to 7.10, bulk of good steers sold from 6.25 to 7.00. Cow stuff scored another advance today of 10 to 25 cents. A few prime heifers brought 6.00 and a few cows 5.75. Bulls were in good demand at slightly higher prices, up to 4.25. Prime light calves sold 50 cents higher bringing 8.00, though a few were sold from 6.50 to 7.00. Trading in the stockers and feeders division limited to a few loads, prices ranging from 3.00 to 5.75.

HOGS—A moderate run of hogs was here today. Prices were 10 to 15 cents higher over last week's close. Tops sold 9.75, bulk going at 9.60 to 9.70.

SHEEP market is firm, with unchanged prices. Lambs 8.25 to 8.30; yearlings \$7.40.

Geese, per lb.	14@15c
Ducks	14@15c
Old	13@14c

Dried Fruits.
Prices show further advance. There is an active movement, both from growers' hands and to the East, where consuming demand is unusually good. Owing to a shortage of apples in the East, the price has jumped sharply. There is a heavy demand through the Middle West. Apricots are firm at old level, with little left in growers' hands. Rain has played havoc with white and Calimyrna figs, and none are offered at present, indications being that there will be little on the market from now on. Black figs also have suffered, and are higher. Prunes have advanced again; the East is evidently anxious to buy, and shortage of small sizes gives them the top price. It is said that the crop will soon be out of growers' hands. Peaches quite firm and moving well. Raisins have suffered heavily from rain; all prices have been withdrawn, while deliveries on orders will be cut at least 25 per cent.

[Net to growers, bulk basis, f. o. b. shipping point.]

Apples, new crop	6 1/2 @ 6 3/4
Apricots, per lb. 1916	13 @ 14 c

Hops.
Coast prices have eased off a little since the first of the month. Extreme prices have recently been quoted in Eastern and foreign markets, and local market is expected to respond to the demand before long.

Sacramento	13@14c
Mendocino	13@15c

Hides.
Remain firm and active, with values as last quoted.

Groceries.
The upward movement of sugar noted since last month's drop still continues, granulated being quoted at a \$7.20 basis. Flour also shows a further advance, with family extras at \$7.60 to \$8 per bbl. at mills. Canned corn in very firm, tomatoes have advanced sharply, a general advance on canned meats is expected. Both salt and canned salmon show an upward tendency. Lard and pork prices very firm.

LOS ANGELES.

Los Angeles, Oct. 10, 1916.

Butter.
Receipts California by rail for week ending Tuesday, October 10:
1916 304,750 lbs.
1915 305,430 lbs.
The market the past week was without feature. Receipts continue to run lighter than a year ago and extras are up from our last review. The consumptive demand holds up well but there was no speculation.

Wed. Thu. Fri. Sat. Mon. Tu.	
1916	33 33 33 33 33 33
1915	26 26 26 26 26 26

Eggs.
Receipts by rail as reported to the Produce Exchange for week ending Tuesday, October 3:
1916 1088 cases
1915 870 cases

A further sharp advance in this market the past week. While receipts continue a little heavier than a year ago, they were no more than sufficient to supply the street trade. Hence in the absence of eastern eggs and storage stocks being light there was a disposition to bull the market. Railroad receipts for the week, 1197 cases and estimated by truck 700 cases for the week. Total 1897 cases, against 1604 cases last year including truck receipts.

Fresh ranch case count	48
Pullets	42

Daily quotations on 'Change:	
Wed. Thu. Fri. Sat. Mon. Tu.	
1916	41 41 43 46 47 48
1915	38 38 38 38 38 38

Poultry.
There was a little better movement the past week and under light receipts broilers, fryers and heavy hens ruled higher. Young roosters were also marked up. There were no eastern arrivals during the week and local receipts only fair. Geese, ducks and turkeys, while slow sale, were firmer. Broilers, 1 1/4 to 2 lbs. 21@22c
Fryers, 2 1/2 to 3 lbs. 19c
Hens, over 4 lbs. 19@20c
Hens under 4 lbs. 15@16c
Ducks 14@15c
Geese 13c
Roosters, 3 lbs. up (soft bones) 18c
Turkeys, heavy, 12 lbs. and up. 21@22c
Turkeys, light 16@19c
Squabs, live, per doz. \$1.50@3.00
Dressed 3.75@4.85

Walnuts.
There was but little done in walnuts the past week. The recent rains checked receipts and damaged the crop about 10 per cent. With fair weather a free movement is expected in another week. Crop is pretty well placed and market is firm at quotations. The associated prices this year and last are:

	1916	1915
No. 1	\$15.50	\$13.60
No. 2	12.50	10.60
Budded	19.00	17.00
Jumbos	17.50	16.60

Orchard run 3c per pound less.

Hay.
The market was again dull the past week. Rainy weather interfered with receipts, but as stock was good, a falling off in arrivals failed to produce better prices. The market remains the same as a week ago.

Barley hay	\$14.00@16.00
Oat	16.00@18.00
Alfalfa, Northern	13.00@14.00
Alfalfa, local	15.00@16.00
Straw	7.00@7.50

SPECIAL CITRUS REPORT.

Los Angeles, Oct. 10, 1916.
Shipments of oranges from Southern California from November 1, 1915, to Oct. 6, 1916, were 30,626 cars and lemons 6700 cars, against 399 cars of oranges and 6579 cars lemons same time last year. Shipments from Central California to Oct. 6, 5400 cars of oranges and 148 cars lemons. Same time last year 5651 cars oranges and 205 cars lemons.

FROM AUCTION SALES.
New York, Oct. 5.—Thirteen cars Valencia, 1 car grapefruit, and 1 car lemons sold. Oranges easier; lemons higher. Weather fair. Valencia averaged \$2.00 to \$6.05; grapefruit \$1.55 to \$2.00 and lemons \$4.00 to \$4.50.

Philadelphia, Oct. 5.—Three cars sold. Market higher with good demand at prevailing prices. Valencia averaged \$3.20 to \$4.50. Grapefruit \$2.40 to \$2.90.

New York, Oct. 9.—Sixteen cars Valencia, 1 car grapefruit, 2 cars mixed and 2 cars lemons sold. Valencia strong; grapefruit and lemons higher. Weather fair. Valencia averaged \$2.65 to \$5.95.

Boston, Oct. 9.—Five cars sold. Market higher and strong on both oranges and lemons. Valencia averaged \$4.15 to \$4.65; lemons \$3.05 to \$5.50, and grapefruit \$2.65 to \$2.85.

SPECIAL DECIDUOUS REPORT

[By J. L. Nagle.]
Continued heavy rains during the past week have considerably affected the first crop of Tokays, 80 per cent of which had been shipped. The second crop is of unusually good quality, the berries being of good size and color and though possibly not containing quite as much sugar as the first crop, seem to be selling up equally as well. At least 85 per cent of the Malaga crop has been shipped. Little or no damage has been done to the Emperors. On account of the forced discontinued shipping, all markets advanced

considerably and although shipments have resumed, we do not anticipate a declining market except on inferior stock.

The following prices have ruled for the week:

Chicago.—Malaga grapes averaged \$1.36; Tokay, \$1.50; Cornichon, \$1.45.
New York.—Malaga grapes averaged \$1.42; Tokay, \$1.55; Cornichon, \$1.59; Muscat, \$1.42; Winter Nellis pears, \$2.35; B. Clairgeau, \$2.45; B. Hardy, \$2.75; Levi peaches, \$1.23.

Boston.—Tokay grapes, \$1.52; Cornichon, \$1.57; Malaga, \$1.30; B. Clairgeau pears, \$2.57.

Total shipments to Oct. 9, 14,008 cars; total shipments same date, 1915, 12,522 cars.

Raising Poultry for Profit

QUESTIONS AND ANSWERS.

Fowls Go Light.—Could you give me a remedy for chicken cholera, also the lightness of hens—they get light and die?—Mrs. J. W. J.

Now the best remedy for going light is to kill and cremate all that are badly affected. No hen that dies of going light ever has cholera because the latter disease only occurs in flocks that are over-fed with a very fattening feed such as corn. We are too scared of the corn in California to ever be troubled with cholera. Give your whole flock a dose of Epsom salts either in mash or in the drinking water and follow this up with ten drops of tincture of nux vomica to every quart of water. Give this for three days, then stop it, and feed good nourishing feed such as a good mash moistened with milk and cooked grain. This flock has had indigestion that has been neglected. Feed plenty of alfalfa or lawn cuttings and be sure to cremate all that die.

Turks Have Warts.—Young turks have warts on the heads and legs, one died, but don't know if that was the cause. They have range and feed on hoppers, alfalfa, and grain.—Mrs. A. E. O.

Your turks have chicken pox; must have been sleeping in some place where they caught a bad cold and it affected them in that way, or by birds carrying the disease as sometimes they do, or again by dirty sleeping quarters. The best thing now is to spray them, or catch them and treat each one separately. If you have a good air pump or even a good bucket pump, provided they don't roost too high, you can spray them with little labor. Get a can of Kreso Dip No. 1, make it fairly strong and go around after they have gone to roost and spray them all over—feathers, head, and legs—at about three different times. Give them about five drops tincture of iron per quart of drinking water. If you catch them, give each turkey many drops through a medicine dropper. It is bitter and the birds will not drink water that has it in if they can help it.

Sore Eyes and Gapes.—Several four-months pullets have sore eyes and gapes. They linger a few days and then die.—Mrs. L. E. A.

The sore eyes indicate roup colds and the gapes indicate that in some cases the colds have attacked the lungs and the chickens have inflammation of the bronchial tubes. For these nothing can be done, but you can perhaps save those not affected in this way. For young stock like these peroxide of hydrogen made pretty strong is the best thing to bathe the head and eyes in. This must be done every other day at least, and every day is better. Give them a little of the following tonic in a good mash and mixed with warm water: One teaspoon tincture of iron and one teaspoon compound tincture of gentian. Add to enough mash to feed 300 pullets one meal and give it to them every day until they improve. Feed them well.

Note.—Now there are one or two cases here that would have been so much better and more profitable

to those interested if they could have received immediate help, instead of having to wait for the help through the paper. I have about sold out my poultry and am spending my time in gaining more and more information to help the poultryman. I am now advertising myself as such. You will still get all

the help you ask for through the paper free, but in special cases where help is need at once and where you want lengthy letters of advice I must refer you to my ad which will appear once a month for information; but believe me you will get your money's worth or I hereby guarantee to refund it.

Poultrymen in the vicinity of Modesto are subscribing liberally for stock in the \$250,000 State-wide marketing organization.

POULTRY JOTTINGS.

The Coalinga Poultry Association will hold its show in Coalinga from November 15 to 18, inclusive.

The steamer China, which arrived in San Francisco the other day from the Orient, brought 612 cases of dried eggs.

The best pen of poultry at the Fresno Fair was that of J. J. Graves' Buff Orpingtons from Redwood City. They were glossy, vigorous, heavy, and typey in build and color. The pen won three championships and one 1st prize.

Tulare is rapidly becoming an important district for the raising of fine poultry. It makes a specialty of heavy table birds rather than birds for egg production, though large numbers of crates of eggs figure in its shipments.

Edgar Grossman of Petaluma, organizer for State Market Director Harris Weinstock and the Poultry Producers' Promotion Committee of Central California, reports that the subscribed number of chickens is nearing the 600,000 mark.

River Bend Farm, St. Helena, Cal., is breeding Danish S. C. White Leghorns. These fowls are white of feather, their eggs averaging 26 ozs. to the dozen. The hens are said to weigh about a pound more than our native birds.

The Sonoma County Fanciers and Breeders Club, organized to encourage breeding of purebred poultry, pigeons and pet stock, and to promote winter shows and exhibiting at fall fairs, will hold a show Dec. 20-23. Score cards by W. S. Russell, judge.

The Tulare Co-operative poultry association's report for August shows an increase of \$270 over the previous month, and beats August, 1915, by more than \$3,000. The total business amounted to \$7,430.81. The egg business for the month amounted to \$4,477.19.

The San Diego Poultry Show management is completing its arrangements for the exhibition to be held in San Diego under the auspices of the San Diego Fanciers' Club, November 4 to 9. Among the prizes is \$100.00 in gold offered by Mr. Spreckels of San Diego for a display of twenty birds in any class.

Dr. Beach of University Farm says 90 per cent of runty chickens are due to worms. He says to starve them a day, then give the juice of steeped tobacco stems, and clean the worms from dropping boards early next morning. If the cause is not worms, it is most likely to be an intestinal parasite which can be disposed of by giving buttermilk for their only drink.

The poultry breeders of Fresno county have reorganized, and the old Fresno Poultry, Pigeon and Pet Stock association has dissolved, many of the members now affiliating themselves with the Tri-State Poultry association, which will give two shows this winter, with the co-operation of the local growers. A show will be held about December 15.

An active campaign has been inaugurated to secure the support of the poultrymen of Stanislaus county for the Poultry Producers of Central California, composed exclusively of poultrymen, to be conducted for marketing purposes under the supervision of State Market Director Harris Weinstock. An amount equal to 25 per cent of his subscription must be advanced by each subscribing member.

C. E. Sprouse recently closed a deal with the Young's Market Company of Los Angeles whereby that concern purchased a tract of land east of the Globe Mills on Main street east of the railroad with a view to erecting a great cold storage, feeding and packing plant. The purpose of the company is to buy, fatten, kill and dress Imperial Valley's poultry produce for the Coast markets, doing away with the excessive freight on live turkeys, chickens, etc.

WINCHESTER

BREEDERS of purebred cattle, and more particularly those with experience in official testing, are well aware of this fact and are carefully laying their plans accordingly. In view of the fact, however, that this contest will include many grade and purebred herds which have not in the past been put on test, and the further fact that this journal wishes to do all it can to place all on an equal footing, as near as possible, the following suggestions are offered for the benefit of contestants in all divisions.

Picking Cows.—The first consideration should naturally be the cows that are to be entered. If weighing and testing of milk has been practiced with the herd, either privately or by a cow-testing association, it will be a comparatively simple task to choose the highest producing animals. In choosing them, however, their production for 10 months, rather than for a shorter period, should be considered, as most of the prize money in the competition will be awarded for 10-month milking periods, rather than for monthly periods.

In case the herd has never been tested for butterfat, those cows that have shown a tendency to be persistent milkers should be picked out and samples taken of their milk, provided they are still milking. Most any creamery will be willing to test these samples for butterfat, without charge.

When to Enter.—The time of entering the contest will naturally depend upon the time of year when the largest number of cows in the herd are to freshen. Fall freshening is general in the alfalfa districts, while spring freshening is the rule in most coast or mountainous districts, in order that the cow may receive full benefit of the spring pastures. Both kinds of cows may be entered in the competition, since entries are open to all up to May 1, 1917. When possible, contest cows in the interior valleys or other warm locations, should freshen as early as possible in the fall in order that they may avoid fly and warm-weather discomforts. Both are factors in maximum records and should be guarded against, especially in the earlier months of the lactation period.

Another point is winter protection against rain and mud. Cows exposed to all sorts of weather or compelled to wade or stand in deep mud cannot be expected to do their best. If there is no good dairy barn on the ranch, where the cows can be kept in during rainy weather, some kind of shelter, either an old building or a covered feed shed to which the cows can go and come at will, is highly desirable, and in keeping with good dairy methods.

Preliminary Feeding.—Having selected the best prospects from the herd, the next step is conditioning. Physical condition before freshening

Feed and Management of Test Cows.

Preparedness, Feeding, and Management will be Contributing Factors to the Successful Winning of Prizes in the California State Dairy Cow Competition which Starts Nov. 1 and Continues 16 Months.

[Written for Pacific Rural Press, and Edited by Prof. F. W. Woll.]

cannot be emphasized, and the best obtained by giving a cow at least six weeks between drying-up time and calving, and more if possible. During that time she should be fed well on a ration that experience has shown to be good, and the one deemed ad-

visable for the cows after they are entered in the competition. Best results will be secured where this ration contains three to four pounds of concentrates until a week or two before calving, when it should be discontinued and hay or succulent feeds used entirely. This practice tends to add flesh to the cow which can, as the saying goes, "be milked off from the back into the bucket," during the early part of the lactation period.

When cows are fed grain before freshening, their test the first week or two after freshening is apt to be abnormally high and this is taken into account by the rules of the competition. No tests will, as a general rule, be conducted prior to the 14th day from freshening. The monthly tests aim to show the average regular fat content of the milk for the various months; and normal conditions of testing must therefore be secured for these tests so far as possible. Also, it will be well to remember that the weights of milk will not be considered till the fifth day from freshening.

Cows differ so much in the system of feeding under which they will do best that the ration should not be definitely decided upon for two or three weeks after freshening. Some cows may be brought up to full feed in two weeks, while with others it will take three or four weeks. It is always best not to force for maximum production very soon after freshening, as the long-distance record is the all-important consideration. The amount of feed given should be determined by the appetite of each individual cow and the manner in which she responds at the milk bucket. If she is doing satisfactory work, the feed should remain unchanged except for a gradual increase in quantity, as circumstances permit. Radical changes should never be made on any account, and the cow must be watched closely while on heavy feed to guard against her "going off feed." If it is found that the ration needs changing, it should be done gradually and in such a manner that the cow always has a good keen appetite.

Succulent Feeds.—Heavy feed consumption is fundamental in the making of large records; and one of the first essentials in the cow's ration is plenty of succulent feed. This is both safe and sure.

Under this heading, wild pasture is preferable when available as the cows choose the grasses they like best and it reaches them in the natural form. This also holds true with alfalfa fields, although care

STICK TO YOUR JOB.

CALIFORNIANS say farewell this week to Henry Miller, one of the most unique, masterful and achieving men of our first half-century as a State. Nearly ninety years ago he arose quietly from the earth, for he had no titles nor endowments at his birth; quietly now he returns to the earth, for his obsequies consisted alone of leaves-taking by his immediate relatives. He goes hence just as he came into the world—in fact, just as he lived his long masterful life in it—quietly, simply and confidently. We forget the colossal fortune he amassed, the kingdom of land which he acquired and governed, because there is a question whether it is good for mankind for one man to have so much. We remember that his transactions had many phases of fairness to his fellow-men; that he kept his word, that he conquered his fellow-men quite as fairly and considerately as men are usually conquered; that he lived his life and did his work straight to the ends he resolved to attain, and he did attain them. We are not sure that these ends are best for a man or for mankind, but it is undoubted that he saw clear and far and that he stuck to his job. This quality has been the enduring foundation upon which all the world's great heroes have achieved, and whose careers are held before the eyes of the youth as worthy of emulation. This quality of Henry Miller we are justified to exalt as a standard under which to wage war upon indefiniteness of purpose, shiftiness and dilettantism, which ruin the efficiency of so many lives. We do not say that any man should try to do what Henry Miller did. Conceive of higher purposes, of more altruistic motives, if you can, and God bless you in pursuit of them, but remember that your success in other lines will depend upon the same quality which Henry Miller chose and conceived to be best in his line: stick to your job!

THE JOY IN WORK.

HENRY MILLER never tired of his work, and his example should be pondered by all who are nearing the ends of lives which have been busy and effective in lines in which they have manifested some creditable degree of mastery and efficiency: stick to your job! Henry Miller planned for himself no retirement to ease and luxury and vain show of the wealth he had won. He knew that he could live longer and get more joy from life by continuing his work to the limit of his physical powers, and so, though arranging against confusion in case he should be quickly called, he lived on and worked on as his strength allowed. He found his joy in work, and that is the only place an active, masterful mind can find joy. Joy in work was no discovery of his; it is an ancient and generalized human experience; all history and literature testify to this fact. And yet, in spite of this fact, too many aging people have dreams of their own of joys of retirement or yield to the illusions which others, not always disinterested, trace for their temptation to idleness. It is a great mistake; joy in work, if once truly felt as a moving principle, is the most enduring emotion of the human mind—next to the ecstasy of per-

sonal love. And the warmth of personal love increases when associated with the joy in working; it is in great danger of cooling in idleness. Some have said: "I will quit work and get acquainted with my family." Such a one has no real joy of work; he is galled by the chains of bondage. Work which is beyond one's physical and mental powers, and which does not awaken enthusiasm and personal satisfaction in its pursuit, is void of joy. We have no experience in it and do not prescribe for it. But work which one can do well, according to whatever standard of efficiency is proper to apply to it, should be a joy to do—in youth, in age, so long as one remains a man. Therefore, we say, from quite a breadth of observation and experience, "Choose not to enjoy the pleasures of sin for a season"—for idleness is sin; yield not the joy in work, as strength abides in you to work.

MILLIONAIRES CHOOSE WORK.

WE ARE aware that choosing millionaires as exemplars of the gospel of work may be repudiated by some who are apt to associate work with compulsion to work, and we have no disrespect for this point of view. And yet, every one should know perfectly that joy in work is not necessarily associated with compulsion in the poor, nor with greed in the rich. Joy in work is creative satisfaction, which may be associated with the straight line of a ditch, the clever stroke of a hammer, the strength of a seam, the flaky crust of a pie, the good turn of an investment, or the grace or force in a spoken or written sentence. Its motive may be to secure the pleasure of another or your own. It is simply doing well what is worth doing—from any point of view whatever. Therefore, it is perfectly proper to cite millionaires as authorities for the joy in work. It is also proper from the fact that if they knew not work and the joy in it, they would probably not be millionaires, to be cited as exemplars of anything. This being the case, we shall cite other millionaires in support of Henry Miller's attitude toward work and his investment of all his life in it. He did not talk about it; he did it. Therefore, we have to support his deeds by the words of others, not by his own. Take the case of Charles M. Schwab, whose millionaireity no one can doubt: this is his declaration:

"I always pity the man who says, 'When I get so much money, I am going to retire and enjoy life.' The greatest thrill that can come to any man is the thrill of successful achievement. In the last year I have had opportunity to sell out Bethlehem Steel for almost fabulous sums. The proposals did not even interest me. If I gave up my business I would be resigning my greatest interest in life."

And so Mr. Schwab keeps on plunging his trusty steel into the central allies—at the regular price thereof. And there is Frances Nash, daughter of the president of the American Smelter Trust, worth five millions and willed to work. Miss Nash, in answer to the question, "Why do you work?" recently said this:

"I suppose it's because I like it so much, because in my work I find self-expression. I don't see that having money has anything to do with the matter. Nobody in the world, who is well, has a right to loaf. Every man, every woman, ought to do something, to have some definite aim, for the good of his or her soul. Besides, it's so very stupid to be idle."

JOY IN INDEPENDENCE OF IT.

BUT, as we have said, joy in work belongs neither to the rich nor to the poor, but to all men and women. Press dispatches brought last week the story of a joyful worker from Ontario in this State, saying that a large saw and an axe, coupled with the labors of cutting pepper and eucalyptus trees into stovewood, have no terrors for Mrs. Katie Norwood, 71 years old. In fact, Mrs. Norwood said recently she enjoyed her tree-cutting work and added that the strenuous work kept her "fit as a fiddle." She cuts and saws her wood regularly, scorning all efforts of aid from her neighbors. "It is honest work," she remarked. "I have no husband to cut wood for me, so why shouldn't I do it myself?" She has grown children who offer her a home, but she has declined to live with any of them, declaring she would much rather be independent and care for her own little home.

There can be little doubt but that joy in work and the will to work, according to the modicum of force which is vouchsafed, are the last and greatest earthly gifts to declining years. You encourage the children to work for the good of their lives in a busy world. It is just as reasonable to encourage the aged to work, as they choose to do it, for the good of their souls.

* * *

WE SHALL VOTE AGAINST SINGLE TAX.

F. F. BRITTON, a prominent fruit-grower of the Santa Clara valley, writes as follows:

"Having taken your paper for over 40 years in our family, I make free to ask you to stir up the farmers of California to work and vote against the proposed amendment to the constitution which would bring the Single Tax theory into operation in this State. Do not let the land-owners have the least cause to claim that you did not warn them fully and sufficiently. Strike some sledgehammer blows at once for the benefit of all land-owners and prevent doubling the burden of taxation on the land alone."

We are very sorry not to gratify so old a friend who has, apparently, a good opinion of our striking power, but we cannot undertake comment nor write discussion of this question. The simple reason is this: To even partially accommodate our readers who would spring to the breach if we opened the question, would exclude from our columns all other things which our subscribers are expecting and paying for. Two years ago we briefly gave a few reasons why we held against single tax, and immediately received fifteen articles, pro and con, which we were obliged to return to the writers, because their publication would occupy one whole issue of our paper. Of course, it may be suggested that we can print what is "on our side" and chuck the rest in the waste basket. This may be a good way for partisan journals, but it is not our way. We prefer to stop at the entrance subjects which we cannot fairly follow and invite our readers to follow, if they wish. We can not handle this subject without swamping our outfit, and there seems less excuse for risking this when our readers already understand the issue so well and are so keen to break out in print about it. Lest our old friend apprehend that we are dodging a declaration of where we stand on the subject, we add that the publisher and editor of this journal will both vote against the single tax—but we will not try to say why, nor invite others to do so, for the reason stated.

* * *

FINDING JOBS FOR THE IDLE.

CALIFORNIA seems to be fighting Satan's effort, to find mischief for idle hands, quite successfully. The State Labor Commissioner, J. P. McLaughlin, has issued a statement of the activities of the free employment bureaus provided for by the last Legislature, which were opened on the first day of last February. Since that date 23,118 men and 3,796 women have been assigned to employment without cost to them nor to employers. The busiest month was August, when 5,952 positions were filled. Of this number 3,499 were outside of the cities of San Francisco, Sacramento, and Los Angeles, and this indicates that the employment bureaus are serving a good rural purpose. Of the 26,914 positions filled since last February 2,707 were agricultural. This seems a smaller percentage than one might expect, but the undertaking is probably too new to be widely understood away from the towns and villages. It may be expected to grow toward agricultural service later. If the plan seems on the whole practicable, it should be much more widely extended, either by State or county enterprise. If there were at all rural centers some way provided by which men could be regularly placed as discharged, there would be less disorder and devilry than now exists, and each community could have a more even labor supply. If a fired man could go quickly from one good bed and square meal to another, the gin mills and railway culverts would be largely depopulated, and all rural property would be more secure. Those who expect to go from rural constituencies to the next Legislature should be thinking and enquiring about what this rather new line of public service can do, both for laborers and their employers.

QUERIES AND REPLIES

Inquirers Must
Give Full Name
and Address.

Orchard Water — When and Why?

To the Editor: We have a seventeen-acre prune orchard between twenty-five and thirty years old. It has never been irrigated until this year. Last May we put in a plant and gave a thorough irrigation. The result was about forty tons of dried prunes. The trees have made very little growth, as it took all their strength to mature the crop. The people in this locality irrigate in the fall—October and November, but it looks to me as if the trees need a good rest. Kindly advise me what you think would be the best thing to do; irrigate now or wait until spring, or both?—Orchardist, Yuba City.

Fruit trees need a fair amount of moisture in the soil during the autumn. This seems to be necessary to secure healthy operation of the functions which belong to the roots after the seasonal activity of the top has ended. It is thought this is particularly necessary after a tree has borne a heavy crop, but we are not aware that this conception has been demonstrated. It may, however, be conceded that roots which have to lose moisture by standing in too dry soil are robbed of something they need. The "rest" which a tree gets by the drying of its tissues is not a "refreshing sleep." Moisture in the soil does not cause "activity" unless the temperature is high, which is not the case in late fall and winter. Therefore fall irrigation will not disturb the "rest" of the deciduous tree. There are two purposes served by fall and winter irrigation. First, the guarding of the roots against injury by drying. Second, the increase of soil storage of water so the tree may have enough to fill the requirements of the following summer, with less, or without any, summer irrigation. If the soil is fairly moistened by early rains, as is the case this year in your district, fall irrigation is not needed to serve the first purpose. If there is heavy rainfall later, winter irrigation is unnecessary—so long as you are ready to give summer irrigation, when desirable. Therefore, you can wait and see what the rainfall does for you. If it should be short and much of it lost by evaporation from hard ground during long dry spells, winter irrigation should be given. It will help you get the ground in shape and will supply the trees what they failed to get because of little rain.

Woolly Aphis on Pear Roots.

To the Editor: I have four old Bartlett trees on light loose red soil. They are growing without irrigation and are badly infested with aphis on the roots. I would be willing to dig up the trees and starve out the pest if no other treatment is suggested that offers any degree of success. What danger would there be of spreading the aphis in digging up the trees and scattering the soil; leave the hole vacant one whole season and then plant again to pears? Is this a possible way to solve the problem? The trees are badly infested and I feel that drastic measures are needed to get rid of the trouble.—E. M. S., Grass Valley.

Though the woolly aphis of the apple is not generally counted a great pest of the pear it does take seriously to the pear in some places in California and there is little hope of eradicating it, but it can be reduced below the power of doing much harm. Unless, then, your trees are so old and decrepit that the woodpile is the only place for them we should work toward relieving them rather than hope to get rid of the pest, for it is so widespread that complete escape is hardly to be expected. Make an excavation around the tree, three feet from the trunk, down to the main roots and pour in enough tobacco wash (1 lb. 40 per cent. tobacco extract to 200 gallons of water) to wet the ground well. This will kill all the lice it can reach. After it has soaked away fill the ring with clean sand which will prevent the lice on the outer roots from getting to the center because they cannot go through the soil except as they find cracks to go in. The tops of the trees should be pruned back this winter and given a thorough lime-sulphur spraying to kill insects and clean the bark. Next spring and summer spray the top with tobacco-soap spray to kill the colonies which appear on the branches. In this way the trees can be re-invigorated, if they have strength enough to come

back, and the aphis kept below the point of much injury.

Alfalfa After Alfalfa.

To the Editor: I wish to plow up some old alfalfa land with a view to reseeded. It is generally understood that alfalfa enriches land for other crops but does it do it for itself? Part of this land is light, never produced much hay even while alfalfa was young, but wish to continue it in same place. Will it benefit the light spots to put on stable manure? If so, how much per acre and how many years should it be farmed to other crops before reseeded to alfalfa?—H., Del Rey, Fresno county.

Alfalfa enriches land for itself just as much as it does for any other plant, but there are two things to consider: First, the enrichment is chiefly in nitrogen content and therefore money can be made by putting on grain, etc., which is stimulated by the nitrogen and cannot make or get it for itself. Second, selling alfalfa hay off the place robs the soil of lime-phosphate, potash, etc., which it must take from the land to make its growth. If grazed, or fed on the place and the manure returned, the soil is repaid for what it furnished and is enriched by the nitrogen which alfalfa can get from the air. If you had rather have more alfalfa than to take profit from grain, grain hay, roots or other crops which you might get in rotation, put on the light land now all the stable manure you can get. You are not likely to get too much on light land, which is presumably well drained, but six inches depth all over it will do. Plow that in now and let it lie in the wet. In February you can disk lightly and reseed with alfalfa when earth and sky favor. Do not wait at all unless you wish to get other crops.

Land Doubtful for Fruit.

To the Editor: I have land which in early days gave three tons of barley hay per acre but now about one ton is the average. There is a loamy soil on top but at 18 to 24 inches below there is a gravelly clay subsoil about 4 to 5 feet through and this is underlaid by sand and gravel. Would this land be fit to raise trees on, and what would do best, apricots, cherries or almonds? The land will hold moisture when well cultivated.—Subscriber, Gilroy.

We should not call it fruit land, either by nature or experience. Land worn out for grain or hay will give good fruit trees if it has anything good below. Your goodness was mostly on top and that has largely gone. If it is level enough not to be in danger of winter-washing, it ought now to be blasted, tractored, sown with bur clover and turned out to pasture—which would bring it back to hay or grain, perhaps as good as ever. It is certainly not good for commercial cherry, apricot or almond growing though even such trees might do for a while, if you do not get rainfall enough to drown them out in the winter and you cultivate thoroughly so they do not dry up in the summer. The trees which would make the best bluff at profitability would be pears and prunes on myrobalan.

Behavior of Black Currants.

To the Editor: I have some black currant bushes, four years old next spring, that have not borne any currants nor any sign of bearing except about a dozen small bunches, but have made a fine growth. They have never been pruned, and are now full of buds for next year's foliage. If they are not going to bear well I shall keep them in no longer.—P., Berkeley.

There is such prevalent distaste for black currants and such a lack of commercial demand for them that understanding of their needs and behavior is very rare. It is known, however, that many popular English kinds are shy bearers in this country, and local effort has to be made to get kinds which enjoy our conditions. We should give the plants longer trial, not pruning them—for the double purpose of checking their vegetative vigor somewhat and of giving them a chance, to bear either on old or new wood—if they will do either. Meantime we would secure from a California nurseryman a few plants of a kind which he knows bear well, to see whether the trouble is in the habit of the plant you have or in conditions not favorable to fruiting.

Fall Pruning of Peaches.

To the Editor: I have old peaches interset with apricot trees two years old. I expect to take out the peaches in a year or so. For the sake of the young apricot trees it would be an advantage to prune the peaches now and get the brush cleaned up before it gets muddy. Will it do any material damage to prune the peaches now? They have not been irrigated but have about 1½ inches of rain.—L. C., San Jose.

It is true that dying back of stubs of severed branches is less if the cutting is done nearer to the start of new growth which favors healing of wounds. The peach is by nature of bark and wood more liable to die-back after cutting than most other trees, but under the circumstances you describe we would not hesitate to go ahead with the pruning now. Most peach trees we see are sufficiently dormant to be pruned. Even if your foliage is still quite active, you can safely do the larger cutting now and shorten the new shoots, which you desire to fruit next year, later in the season. If they are not active we should finish the job now.

Non-Bearing Persimmons.

To the Editor: I have two trees of the Eastern wild persimmon, which bloom and set full of fruit each year, but fail to mature it. Why do they not mature? I got the seed from a tree in Kings county which bears full of fine fruit.—J. T. C., Crow's Landing.

The American persimmon usually grows staminate flowers on one tree and pistillate on the other. Possibly your trees are both pistillate and in that case might be expected to bloom, set fruit and drop it, for lack of pollination. In that case the fruit would not be expected to get large and would contain seed skins without kernels. If these are the facts with you, the explanation is indicated. If however you find fruit which becomes fully formed but does not ripen, we cannot explain that. It might be added that the Japanese persimmon is somewhat different in habit and bears enough staminate flowers on the same tree with the pistillate to pollinize the latter, but seedlings of that species are apt to fail to do this when young.

Transplanting Raspberries.

To the Editor: Is this the right time to set raspberries: vines of this summer's growth which are still growing?—B., Carpinteria.

They can be successfully re-set now if not to be moved far. They are shallow-rooted and you can easily take up a lump of earth to go with the enclosed roots to the new place, and the plant will not know that anything has happened. For transplanting which involves shaking out the roots and packing later transplanting would be better.

Navel Oranges with Seeds.

To the Editor: Does a Washington Navel orange, planted among non-seedless trees, eventually produce fruit with seeds? I am told that unless this variety is planted at some distance away this result happens.—A. J. P., Victoria, Australia.

A few navel oranges have a few seeds and a few non-seedless oranges have navels, but neither phenomenon has been traced to association of proximity. No attention whatever is paid to separate or distant plantings in this State for that reason.

Pruning Raspberries.

To the Editor: I have irrigated my raspberries very liberally all summer, with the result that I am now getting quite a crop from this year's canes. I have had the old canes cut out. How shall I prune those now bearing, to insure fruit from them next year?—Amateur, Los Altos.

Prune lightly—cutting just below the old tips which have fruited. The next fruit must come on laterals which will start out from buds lower down on the same canes which are now giving you fall fruit.

California Weather Record.

The following rainfall and temperature record is furnished the PACIFIC RURAL PRESS by the United States Department of Agriculture Weather Bureau, at San Francisco, for the week ending at 5 p. m., October 17, 1916.

STATIONS	Past Week	Rainfall Data		Temperature Data	
		Seasonal To Date	Normal To Date	Max'm	Min'm

Community Frost Alarms.

Fruit Districts the State Over Are so Specialized that this Story May be Used in Most Deciduous District as Well, Wherever Loss of Crop by Frost Costs More than Frost-Fighting Equipment.

[Written for Pacific Rural Press.]

About 400 orange growers around Pomona go to sleep on cold nights with easy minds, knowing that if any of their 4500 acres are threatened with frost, and not till then, they will be awakened in time to light the fires. It was for this purpose that the Pomona Valley Orchard Protective Association was formed some time before the big freeze. Smudging in those days was considered by many to be a community nuisance, and vicious opposition was experienced by those who sought to drive Jack Frost away by burning coal or oil or asphalted shavings "to heat up all outdoors." Such measures filled the parlors with soot, and also spoiled the looks of oranges and trees.

Opposition Overcome.—But when the deep wide river of cold flowed over the mountains, slowly enveloped the foothill orchards, and flowed on down through all the citrus belt to the dairy lands beyond, many whose life savings were in their orchards saw their hopes blighted as the trees were frozen.

One of the busiest spots in a busy land on those winter nights was the office of J. E. Adamson. He had charge of the riders who made ceaseless rounds of the thermometers hung in orchards of Protective Association members. It was he who received the reports of the riders, mapped the temperatures, watched the progress of that cold air river, and gave the word to telephone central when time came to rouse a certain "block" of orchardists that they might fire the frost king. That they saved their orchards during such time of disaster, overcame the opposition to "smudging." At this writing, in January, 1916, there is no opposition, and practically every orchardist is a member of the Protective Ass'n, if he has frostpots between a line west of San Dimas, another east of Ontario, one about a mile south of the Southern Pacific tracks and a fourth four miles north of that railroad where the hills rise too high for citriculture.

How They Do It.—The system now is to have the district mapped into 17 blocks, each of which is intended to include all orchards likely to need firing at once. The blocks are also somewhat regulated by the farmers' telephone line locations. About 140 thermometers are located at significant points where they will best indicate approach of frost. These are blocked off into seven "runs" averaging about 12 miles each.

The headquarters of the Ass'n of a cool night are at the Park Ave. packing house of the Pomona Fruit Growers' Exchange. A thermometer there tells the maximum temperature of the day. This is important in judging whether there will be freezing that night. If the ground, trees, and fruit are warmed during the day, they can stand much lower temperature without damage that night.

Avoids Unnecessary Firing.—As

Mr. Adamson says, it is almost as important to know when not to light the fires. Every time they are lighted, there is soot in the air, on the trees, fruit, and men. Oil or fuel is burned at considerable cost, and must be promptly replaced. Men must be called to work in the dirty night. Such disagreeableness is to be avoided. One man a few weeks ago complained that he had been called to light the fires when his thermometer read 32°. On account of his telephone line, he was in a block in which it had gone down to 26°. He will be notified with those in another block hereafter.

Activity on Frosty Nights.—When at sundown, a frosty night seems imminent, either Mr. Adamson, who is also weather reporter for the Government, or H. E. Walcott, manager for the Exchange, await notice from the packinghouse night watchman that the temperature has lowered to 34°. He then takes charge and calls up several dependable growers in various parts for reports on temperature.

The riders are started when the thermometer reads 31 or 32°. They aim to start so that all seven of them are reading their first thermometer at once and so with the rest of the 20 thermometers. These men are paid \$5.50 per night and they make three to five trips, depending on the rapidity of falling temperature. They report at the end of each trip the temperature at each thermometer. If anything unusual shows up they report by telephone. They travel by motorcycles and automobiles, the latter being faster as a rule.

Temperatures Recorded.—The district is mapped into the 17 blocks, numbered by hundreds. On this large map, only the principal roads are shown and a circle represents each thermometer. The circles are identified by consecutive numbers prefixed by the "hundreds" number of that block. As the riders report, the temperatures are marked with a fine pen inside the corresponding circles.

On a frosty night many growers get impatient, and sometimes it nearly keeps one man busy answering the telephone calls of growers who want to know the latest on thermometer number "00" which is located near their orchards. It is no trouble to locate that thermometer on the map by its number and to tell its record.

Injurious Temperature Varies.—Any report after the first shows the rapidity of fall. If great, or if the temperature has been low the preceding day, fires are ordered soon. If there are blossoms or young fruit on the trees, protection will be required at higher temperatures. Orange juice freezes at 28° so prolonged exposure at 27° does not often injure the fruits. This season the thermometer has read 30° at 10 p. m. and only 27° in the morning. Even lemons are not fired for such conditions unless there is a lot of small fruit. This has not been the case this sea-

*2 1/2 tons
more to the acre
than ordinary alfalfa
is the record of
Hairy Peruvian Alfalfa*

Here's good news
for alfalfa growers--
a new thoroughly

tested plant that will produce the greatest alfalfa tonnage known---and under all climatic conditions. Has been tried out and endorsed by Arizona State Experiment Station, and by growers in both hot and cold countries.

Supt. of Arizona Station says: "Hairy Peruvian produces heavily in all climates practically the year round. Gives farmer maximum yield from his land. Does equally well at 5000 feet or at sea level. The plant is heavily leaved, thus giving highest food value. We recommend it above all other types." W. B. Cloyd of Yuma says: "Hairy Peruvian is greatest producer. I now get one more cutting per year." David C. Aepli of Yuma says: "Hairy Peruvian outyields other varieties 15% to 20% per acre."

Don't fail to plant Hairy Peruvian this season. Produces one ton more per acre than the famous Peruvian mother plant. Write for complete information.

son, so lemon orchards have been fired only four times and not all of the orange orchards three times. The riders were out three nights in November, five in December, and five in January.

During the present winter, the air has been moist at night, and fewer firings have been necessary because in damp air the fruit will not be injured by lower temperatures. But when the air seems dry, the judgment of the manager as to when firing should start is aided by taking hygrograph readings to show the humidity.

Telephone Girls Do Good Work.—When firing is likely, the Association pays two extra telephone central girls to be on the job ready for duty. When a block is to be fired, a telephone girl, with duplicate map and list of members, is told to call them.

On Mr. Adamson's line the alarm call is five rings. Each grower an-

swers the call telling the operator his number. She checks it off from her list. If any do not answer, they are called again and again.

Cost.—The cost of all this service last year was about three mills per gallon of oil burned. The year before that, the cost was about one mill on account of more oil having been used. The season of the big freeze, the cost was below one mill.

About \$500 per year covers the total cost for patrolling and everything. Besides this, the Association appropriated \$500 the year after the freeze, for experiments to find the best protection. Part of this was spent covering an acre of lemons with cheesecloth. It was a dismal failure. The rest was spent working on a gravity pipe system to convey oil from a central tank to the pots as it was burned. More will be heard of this later, as the experiment is still financially supported by the Association and seems to be proving out.

Coast County Orchard Cover Crops.

[Written for Pacific Rural Press by John J. Fox, Napa.]

The coast counties of the north and many other sections have only the winter rains to depend on, and our choice of cover crops is considerably curtailed. We cannot grow the melilotus, either alba or indica—because we have to plow just about the time it starts to grow. Hairy vetch is delicate, cow-peas are out of the question. So far as we have gone the bur-clover and purple vetch have given the best satisfaction, though some ground is so debilitated that it will not even grow a vetch or Canadian pea to make a decent crop by plow time. In these cases a good thick sowing of barley, oats, or rye generally produces a good crop to turn under by the middle of March and the probability is that the following year a crop of vetch, bur clover or field peas may be relied on to make a crop; if at seed time, weather and soil cultivation are good. Of the three cereals, barley makes the best crop with us, provided the ground is not too wet. Though it is the shallowest-rooted, and has the weakest powers of penetration, it is a gross feeder, stools better than any, and has great recuperative powers. From one to two hundredweight of nitrate of soda applied about three weeks or a month before plow time, shows up to a foot where it fell, producing a rich, deep, nitrogenous green in a foliage that has perhaps been rendered yellowish by a long-continued wet spell.

I am firmly of opinion that this stimulus (nitrate of soda) which reaches the tree roots shortly before the fruit sets, is a great aid to a good set. It stands to reason that good long, dark fruit stems on the prunes are better able to withstand slight thrips, scarring, or north wind than thin, attenuated stems. The short-stemmed stuff always falls off anyway. In our coast counties, it is good to get your cereals cultivated in in October. Bur clover should be sowed on top and lightly brushed in if touched at all; but not harrowed, or much of the seed would get buried too deep to germinate. Fifteen or 20 pounds per acre is enough. Vetches here do better drilled in than broadcasted. Rough-

ly, 100 pounds per acre of purple vetch makes a good crop.

The Horse Bean is one of our best cover crops. This will be discussed next week.

In the mountainous counties of California, the State Highway Commission is now building highways very successfully with convicts. The roads thus built cost one-fourth less than the engineers' estimate, and only half what similar work in the same locality cost when done by contract.

Bartlett Pear

On Blight-Resistant Roots

There never was a more favorable time for Pear planting, but be sure your trees are planted on Japanese Roots. We have given this root a thorough test for over five years, and discarded all others in its favor.

All our trees are propagated from trees selected for their bearing qualities and grown in the granite soil in the foothills of the Sierra Nevadas, assuring a fibrous root system second to none in California.

California's Great Cattle King Dead.

[Written for Pacific Rural Press.]

The Late Henry Miller, of Miller & Lux.

Henry Miller, senior member of the widely-known firm of Miller & Lux, intimately associated with the beef cattle industry from the very beginnings of California's history (dating from the "gringo" invasion), died at his home in San Francisco Saturday, Oct. 14. He was born July 21, 1828, in Brackenheim, Germany, came to the United States in 1847, and to California in 1849. He arrived here with \$6 in his pocket.

The career of this remarkable character, whose executive genius and tireless industry amassed a principality in land rated at between 3,000,000 and 10,000,000 acres, lying in California, Oregon, and Nevada, on which graze bands of sheep and cattle beyond computation, has been variously estimated. And as if these outstanding achievements were not enough to absorb all the activities of his dynamic nature, he embarked in large projects of irrigation, grain and fruit raising, and numerous commercial enterprises, such as abattoirs, merchandise stores, banks, etc.

It has been urged that the concentration of such large land holdings in the hands of a single individual is inimical to the public weal, as not securing the best use of the land to the largest number of people depending on that land for subsistence. But it may be well doubted, considering the early period in the Coast's development covered by Mr. Miller's activities, whether the land which he controlled would have been bet-

ter used, or used at all, had he not appeared on the scene.

However, Death has ended the sway of the great land baron, and his colossal holdings will now in the fullness of time doubtless be broken up and devoted to intensive cultural purposes. After all is said, pro and con, of the usefulness of such a life, no one can withhold a meed of praise from the penniless little German butcher boy whose foresight, pluck, and indomitable industry carved out a career of accomplishment impossible to any not possessed of great virility and far-seeing vision. Another great pioneer has passed from the scene of earthly action, and his departure marks an epoch in California's agricultural development.

THE NEW LIMA BEAN ASSOCIATION.

[Written for Pacific Rural Press.]

Of the million and a half bags of lima beans which are annually grown in California, the recently organized California Lima Bean Growers' Association, with headquarters at Oxnard, Ventura county, have over a million bags signed up for the present year. Such is the advice of Frank Shipley, manager of the Association—which sprang into life March 29, 1916, after the failure of a previous bean growers' association through lack of growers' support.

The plan of organization of the

IMPERIAL Double Disc Engine Harrow

SPECIFICATIONS:

Axle, 1 1/4 inch square steel; Frame, 5/16x3 inch angle steel, double reinforced at the corners. Discs, 18 inch extra heavy, cutaway, 8 point. Bearings, hard maple with hand oil cups.

The principle of this machine is that of two Disc Harrows, one out-throw and one in-throw, built together under a strong, rigid, heavy angle steel frame. The forward Harrow works exactly like the ordinary Disc Harrow in cutting the ground and throwing it outward from the center. The rear Harrow works in the opposite direction, cutting the same ground and throwing it back. The result is equal to that secured by two workings with an ordinary Disc Harrow, but the soil is more thoroughly pulverized and the surface more effectively leveled. Requires but little more power than single disc of same width.

GEO. N. TYLER,
Brookdale Nursery, Los Gatos, Cal.

new company is similar to the Walnut Growers' Association, in that locals are established in all lima bean growing districts. Delegates from these local associations form the directorate of the main Association, serving without pay. No capital investment is called for as the only expense incurred is the salary of the manager which, with other incidentals, is charged up to marketing expense at the end of the year. Selling is done through brokers located in all parts of the United States who finance themselves in their selling operations.

At the time of joining a local association, each farmer signs a contract binding him for a period of years, with the option of withdrawing the first of January of any year, but not later.

Each local is held responsible by the main Association for the beans going through their warehouse, but supervisors are also sent into the various local packing houses from the main Association.

As one of the objects of the Association is to overcome the wide fluctuation of prices, a basic price per pound is set after the size of the crop is determined, usually around the first of September. This year the latest price of 5.60 and 5.65 (named early in October after rains had damaged the crop) was withdrawn Oct. 13 until rain damage could be finally determined. The accurate reports it has from all districts will enable all its members to know what the selling price ought to be, and the Association will sell at that price when it shall have been determined. If the damage is not too great, they will make up their loss by increased prices. But the price will not be raised enough to prevent sale of the entire crop, as determined by the directors.

Next year the Association expects to adopt a brand of its own, under which every sack will be sold, but sufficient time for working out this trade mark selling system was not given the directors for the present year's crop.

BERMUDA FOR PASTURE.

To the Editor: I see in a recent Press you give Bermuda grass a good word. I was glad to see it. I think Bermuda is one of the best grasses we have. My Bermuda lies hot and dry and white until I need green grass to wean calves on; then about August last I turn the water on it. Of course, if the man has the water, he can turn it on before. Then it will start and will not need more than one-fourth the water of anything else, or you can keep it soaked. It "saws wood" under any and all conditions. If you water it only once or twice in the fall, it comes along and makes very good feed. If you water it plenty, it makes more. If you don't water it all, it is still there for another year. After a man gets a good stand of Bermuda, he is never bothered with reseeding; the gophers don't bother it. In fact, nothing seems to bother it. All this is from the standpoint of a stock raiser, and no other standpoint. Green feed—cheap green feed—is what the stockman wants. With Bermuda, if a man gets so he can get no water for the entire summer, he does not lose his stand; or if he

waters it in July say, it comes green; and green it will stay all summer, whether you water it any more or not. I water mine about once a month after I start it in August.

W. T. Jones.

Shawmut, Tuolumne County.

ALFALFA IN TRUCKEE VALLEY, NEVADA.

[Written for Pacific Rural Press by Bert S. Wolf.]

Truckee Valley was visited with much cold weather this past year; the consequence was that the alfalfa crop was about 75 per cent, cutting close to two tons per acre. However, the second crop cut about two tons to the acre; and as the hay prices are better than last year, a

fairly good revenue should be counted on for this year.

Very few farmers cut over two crops in this Valley. The first crop was cut about two weeks late this year. There is a fairly good water supply here. The bench land is irrigated about every ten days and the heavy land every two or three weeks. The cost of baling is about \$2.25 per ton. However, comparatively little is sold, as most farmers feed to stock.

FALL SPRAYING FOR SHOT-HOLE AND BLIGHT.

To the Editor: In your issue of September 23rd in regard to peach blight and shothole or apricots I think we should have all the information possible. There is entirely

too little fall spraying being done for this fungus, and I would strongly urge the necessity of a liberal application of the crude oil spray on both prunes and apricots as soon as the shedding of foliage will admit for brown scale, Italian scale, moss and lichens. I think too many of us are getting negligent with our fall clean up.

San Jose.

L. C. Sims.

[We have the story of how a man sprayed for peach blight, and the probable reason why he failed. We are glad to have Mr. Sims' suggestion, but it is well to know just how strong your crude oil is, before using it.]

A party of Japanese students and professors has been in Tulare studying the rice and fruit industries of Tulare and the Tulare lake region.

Have Some Sheltering Palms in Your Yard

MAKE YOUR HOME the most attractive place in your locality. It can be done easily. A large variety of palms, ornamental and evergreen trees, shrubs, climbing and trailing vines, flourish in our wonderful Pacific Coast climate. They don't cost much and they add value to the property. A few of them well placed will help to make the country home just as attractive as the city home.

Let us help you beautify your home grounds. We have a special department for advising you how to lay out your place—the varieties best suited to your soil and locality—how to plant, prune and care for stock. We'll be glad to advise with you free of charge. Write us.

Fruit and Ornamental Trees, Vines and Shrubs

—a wonderful stock for this season's planting.

We can supply your every want in fruit and ornamental trees, roses, vines, etc.; olives, oranges, pears, plums, apricots, peaches, walnuts, pecans, etc. Our stock is TRUE-TO-NAME, strong and healthy. Send us your list for prices and suggestions.

EUCALYPTUS WINDBREAKS NECESSARY AND NOT INJURIOUS TO ORCHARDS.

[Written for Pacific Rural Press.]

Lemon trees protected by windbreaks on the G. C. Power ranch in Ventura county have grown more in the past two years than in the four years before, because the windbreaks have grown enough to protect them from the raw ocean winds and fogs. Now over two-thirds of the fruit comes from the half of the orchard thus protected, according to L. G. Duval, superintendent of the ranch.

There are 150 acres of trees, divided into 50-acre blocks by eucalyptus trees interplanted with cypress which are also around the edges. The windbreak is not yet high enough to protect the lemons farthest from them on the lee side. Blocks of 33 acres with windbreaks not over 525 feet apart would be better, says Mr. Duval.

The eucalypti are eight feet apart in double rows 12 feet apart, with cypress trees set between. Some of them were pruned pretty high so the wind swept under them. Here, the first two or three rows of lemons are considerably whipped about.

Did you ever try to grow things near eucalyptus trees? We have, in San Mateo county, and the trees are being sacrificed. The roots feed everywhere and take all there is to get. Mr. Duval has found their roots 150 feet from the trees.

Tractor to the Rescue.—But the eucalyptus trees don't and won't hurt Mr. Power's lemon trees. A 75 h.p. tractor is hitched to a subsoiler with a four-foot standard; and the roots are cut eight feet from the trees. Having begun early, no roots big enough to feaze the subsoiler were encountered, and the rest of the roots have gone downward. No injury to the windbreak could be noticed. If some roots go under the cut and rob lemon trees, the subsoiler will be run through, 20 feet further out.

The subsoiler was bought by 11 neighbors who put in \$50 each, last April. It is of 1¼-inch plow-steel 16 inches wide and four feet long.

Improvement in the lemon trees is not yet noticeable on account of the necessity for the soil to recover, but a neighbor who had a 40-foot strip of alfalfa along his hedge got twice as much alfalfa since he cut the tree roots this spring, as ever before.

The practice was undertaken after Mr. Duval had taken a trip to the Rialto section in San Bernardino county, where he found 25-year eucalypti around 20-acre orange orchards in which even the first row showed no injury from the windbreak trees. Their roots had been cut with subsoilers regularly at a contract price of 12½ cents per rod. It is easy if done annually, beginning when the trees are young.

TRACTOR BEET AND SPINACH FARM.

[Written for Pacific Rural Press.]

The first three Sandusky tractors used in California were bought by three different Japanese farmers. The third one was bought by J. Masuno of Los Angeles county, and he has two now.

While we were attending the Puente demonstration, we saw Robert Ikeda driving one of them to haul sugar beets to the station. Mr. Ikeda speaks good English, and here are the facts as he gave them to us.

They have wagons, with long beds and 5-inch tires, on each of which they haul a 5-ton load of sugar beets. This is taken out of the field by the tractor on low gear, then hauled on the road on high gear at fast speed to the car. This wagon is left at the car to be unloaded, while an empty wagon is hauled back to the field. Two shorter wagons holding 8 tons have been pulled from the field without much effort; but these together are longer than a car and cannot well be unloaded without moving, which is not so feasible with the tractor gone. When hauling, about 20 gallons of distillate are used per day of 10 hours, but when plowing, the engine works nearer to its capacity and steadily. A gallon of 47-cent cylinder oil per day is used in hauling. The tractor is well cared for.

The 100-acre field had been prepared for beets last spring with the tractor. It is subirrigated, too much in some parts, but the tractor doesn't mind wet feet. Four 10-inch moldboards were pulled 8 inches deep. An 8-foot disk followed by an 8-foot Sweet harrow and that by a three-section steel harrow were pulled over the ground three times, on low gear. Then the planting, cultivating, and digging were done by horses on account of the broad wheels.

While one tractor was hauling the beets, the other was plowing 50 acres of the beet field, on which spinach was to be planted for a winter crop, which had been already contracted to the cannery for more money per acre than from the beets.

THE SANDUSKY TRACTOR

THE LITTLE FELLOW WITH THE BIG PULL

15 Draw Bar H. P.—35 Belt H. P.

We guarantee THE SANDUSKY TRACTOR to be 15 H. P. at the Draw Bar and 35 H. P. on the Belt; to handle four 14-inch moldboard Plows, eight inches deep where a big team can pull one 12-inch Plow six inches deep, to run Belt Machinery up to a 32-inch Separator; to have one-third reserve over its Draw Bar rating and for one year against defective workmanship and material.

Your Money Buys a Tractor, and Your Money Keeps It Going. Why Not Investigate How Little It Will Cost You to Run a "SANDUSKY"?

A Plain Statement of Fact

Mogul 8-16: \$725 Cash f. o. b. Chicago

AT the present prices of gasoline and kerosene, no farmer can afford to use a gasoline tractor. Gasoline averages now over 100 per cent higher in price than kerosene and is likely to go higher rather than lower, according to men who know the oil business.

Again, it is neither safe nor economical to use kerosene in a tractor not specially designed to operate on kerosene. Merely changing the fuel mixer is not enough; the design of the whole motor must be changed.

Mogul kerosene tractors and gasoline tractors of equal power sell for about the same price and use practically the same amounts of fuel. On that basis a Mogul 8-16 tractor saves each year, in fuel bills alone, about a third of its price.

If you are considering the purchase of a tractor this year, give these facts careful study, from every point of view, before you spend your money.

Mogul tractors are designed specially to operate on kerosene and to give their users the full benefit of this advantage. There are two sizes—Mogul 8-16 and Mogul 12-25. Write us for the story of kerosene before you buy any tractor.

CO-OPERATIVE BEAN THRESH- ING.

[Written for Pacific Rural Press.]

Community ownership and use of a tractor, we are as yet unable to locate, but community ownership of a lima bean thresher was recently called to our attention by one of the owners, E. E. Dunning of Ventura county. Eight bean farmers have \$8,000 invested in the machine, which includes a 30 h.p. steam engine. They have run it 10 or 12 years, according to Mr. Dunning.

Ventura county beans being raised not only on the level ground along the ocean, but also on the hillside bordering it, there is a very considerable and convenient season for threshing. Mr. Dunning's 70 acres being on level, somewhat subirrigated land, his crop is usually latest in maturing and last threshed. It is expected to yield 35 sacks per acre and sell for \$12,000 or more this season, being harvested about the second week in October. The vines are two-thirds as big as one's finger and full of unmaturing pods.

The machine threshes 1500 to 2000 bags per day if dry, and requires a crew of 50 men and a dozen teams. Seventy acres are threshed per setting. Two men feed the machine, not stopping to spread the matted vines at all.

The machine is busy three weeks in the hills before any of the owners' crops are threshed, for they all live on the level. They charge 25 cents per hundred to thresh for outsiders and \$1 per ton for recleaning and weighing into 80-pound sacks.

One man is given charge of operations and crew. He decides whose fields are ready and whose are not. After the machine comes down from the hills, it takes the fields of its owners in order as it reaches them. Those that are not ready are skipped; and threshed on the clean-up return trip. If any member insists on threshing his crop too green, he is charged extra.

These same eight co-operators until recently owned their own irrigation plant, but that will come later.

FRICTION IN PIPE.

To the Editor: What size cement pipe would be necessary to carry irrigation water from a No. 4 pump 2000 feet? The land falls about 2 feet in this distance, but I can deliver the water a few feet higher in a standpipe. Also, if 600 feet is too long to run water in furrows? The soil is a heavy loam (chocolate).—H. C. J., Stockton.

[Answered by Prof. S. H. Beckett, University Farm.]

Under the conditions stated I would advise the use of a ten-inch diameter pipe line. It is assumed that the centrifugal pump referred to discharges 450 gallons per minute. This quantity when delivered through a ten-inch concrete pipe line produces a friction head of 2½ feet per 1000 feet of pipe. With a fall of two feet in 2000 it would be desirable to elevate the water at least 3 feet in the stand pipe.

If the land to which you refer takes water readily and if it is on a flat grade (less than about 2 inches per 100 feet), then 600 feet is too long a run in furrow irrigation. Under these conditions, it is generally concluded that a length of furrow from 300 to 350 feet is most desirable. If on the other hand, the soil takes the water slowly, and if you are able to control the water

Do It Electrically

ELECTRIC APPLIANCES in the household, not only add to the convenience of all members of the family, but they are economical and time-savers.

ELECTRIC APPLIANCES include CHAFING DISHES, COFFEE PERCOLATORS, VACUUM CLEANERS, ELECTRIC IRONS and every other appliance that is needed in the modern home, not forgetting **ELECTRIC FANS**.

The year's pack of the Lake Co. Packing Co.'s pack of beans will be about 25,000 cases.

Butte Co. Horticultural Commissioner Earle Mills requests quarantine against Oregon nursery stock.

Manager Murphy of the Phelan Ranch, near Oroville, is preparing a new tract of 600 acres for rice culture.

The Sacramento Valley Sugar Co. is signing up farmers to raise beets for the operation of their factory next year.

The yield per acre of hops in California for 1916 is 1800 pounds per acre as compared with 1,484 pounds on a ten-year average.

Arizona grows several trees which produce rubber, chief of which is the guayule, yielding 8 to 29 per cent of rubber in the dry shrub.

The contract for the erection and equipment of the new \$1,000,000 beet sugar factory on the Whitehall Estates, near Tracy, has been let.

San Francisco exported 8,838 bales of cotton during the week end-

ing Sept. 15, 1916. A Government forecast made Sept. 25 places this year's production of cotton at 98,000.

The California Lima Bean Association Oct. 16 paid its first dividend of 2½¢ per pound on account of beans delivered in September. The association will pay on the 15th of each month 2½¢ per pound on beans delivered the preceding month.

The condition of the cotton crop of California, as per U. S. Bureau of Crop Estimates, was 93 per cent of normal on Sept. 25, compared with 56.3 per cent for the United States. The indicated yield per acre is 484 lbs., as compared with an indicated average yield for the United States of 156.3.

DECIDUOUS FRUITS.

Orchardists of Tulare Co. are to ask Congress to appropriate \$50,000 to fight the squirrels in California and other Western States.

Eastern jobbers and handlers of California dried fruits are praising the California Peach Growers' Company on the excellent grade of dried peaches it is turning out to the trade this year.

Napa County Horticultural Commissioner, John J. Fox, writes that the early sown orchard crops in his district are already showing up green and others are getting their seed sown now.

The consolidation of the great fruit, vegetable and salmon canning corporations of California is about completed. The new concern will be known as the California Canning Corporation, and will be capitalized at \$27,000,000.

Sec'y W. J. Hill of the Cal. Cured Fruit Exchange advises that their former cashier, due to whose manipulations the Exchange quit business, has been committed to the Superior Court for trial on the charge of embezzlement.

In the apple forecast issued recently by the U. S. Dept. of Agriculture the combined crops of California, Oregon, and Washington Newtown Pippins is estimated at 584,000 barrels, an increase of 22 per cent over last year.

Word reaches us from San Jose that a committee of promotion, engaged in organizing the State selling association of prune and apricot growers, gave a banquet last Monday to H. S. Hersman, a banker of Gilroy, who has just been elected chairman campaign committee.

In our issue of October 14 we stated that the Sixth Annual Apple Show of the Farmers and Apple Growers' Association would be held in Ukiah from Oct. 25 to 28 inclusive. This is an error. Mendocino is the home of the Association and all its annual events are held there.

J. C. Teague of Hanford says shellac is better to cover cuts in trees with than paint, as it lasts much longer. One application will last for a year. He claims that a large part of the root knot common in Kings Co. is due to the fact that cuts are left bare, giving the rain a chance to penetrate.

The "stop-in-transit" privilege has been adopted by the transcontinental lines. The importance of the "stop-in-transit" privilege rests in the widening of markets for California fruits, for shippers can stop a car of fruit at any point between this State and the Atlantic coast, unload a portion of the car and then ship the remainder of it to its final destination. For this the shipper pays 5 cents a hundred pounds.

CITRUS, NUTS, SEMI-TROPICAL.

Five cars of early navel oranges are being picked from the Merryman orchard, near Exeter for shipment to Australia.

Reductions in transcontinental freight rates will become effective

WESTERN SOIL BACTERIA CO.
442 Sansome St.
SAN FRANCISCO, CAL.

on November 24. Lower rates will obtain for walnuts and almonds.

The Naranjo orange groves near Exeter have changed owners for a consideration of \$75,000.

The new crop of Sicilian almonds is good. The production will be about 250,000 bags of 220 pounds each.

The lemon crop was greatly aided by recent rains. No irrigation will now be necessary for two months, says a lemon grower of Santa Barbara.

Of the \$1,635,619 worth of olive oil imported by Brazil in 1915, the United States sold to the value of \$657 only. Portugal was the chief source of supply.

Considerably more than \$1,000,000 was received by the Corona citrus growers for fruit during the 1915-16 season. The total number of cars shipped out was 1064, 486 of oranges and 578 of lemons.

The Oakdale Almond Growers' Association will provide the almonds for exhibits which will be made at all the food shows in the East by the California Almond Exchange. The almonds are to be prepared according to variety.

The Orange County Fruit Exchange of Santa Ana, in its annual report, just issued, shows that it shipped 285 cars of oranges and lemons during its last fiscal year for which it received \$2,450,326.

The fourth semi-annual meeting and exhibit of the California Avocado Association is to be held in the Maryland Hotel, San Diego, Cal., October 30 and 31. The directors have decided that the exhibit shall be educational only and non-competitive.

California's olive crop this year will be far below normal, but the orange, lemon and grapefruit crops will be "bumpers" says Deputy State Horticultural Commissioner George P. Weldon. The olive crop will be only 10 to 70 per cent of the normal yield.

There are about 296,525 acres of olive groves in France. The French olive yield from 1905-1914 averaged about 11,800 metric tons, which is about 18 times less than the Spanish production, and 15 times less than that of Italy. The olive production of Algeria and Tunis also exceeds that of France.

The annual report of the San Bernardino County Fruit Exchange, including in its membership, Colton, Hemet, Highgrove, Rialto, Fontana, and Bloomington, distributed 829 cars of citrus fruits the past year, of which 756 cars were oranges of a moneyed value of \$650,000. Eighteen cars of oranges were shipped to Europe.

GRAPES.

The Lodi wineries of George West & Son expect to pay out a total of \$350,000 for grapes.

Nearly a ton per acre of Thompson raisins were picked from two-year vines last fall by F. H. Booth of Kerman.

The American Consul at Patras, Greece, reports that the total new currant crop is estimated at 100,000 tons, or two-thirds crop.

The cause of sugared raisins is being sought by a chemist recently employed by the Associated Raisin Co. No rule has yet been found that holds good in all cases, writes W. M. Giffen.

Wylie M. Giffen writes us Oct. 16 that the Company is estimating that 25 per cent of the Muscat crop is ruined beyond all hope of saving; 50 per cent will undoubtedly be saved; 25 per cent still in doubt.

The G. Magliavacca Wine Co. have been crushing grapes at their big cellars in Napa at the rate of 250 tons per day. Growers have received \$22 per ton in cash for the products of their vineyards.

MISCELLANEOUS.

The appointment of a Farm Adviser for Tulare county is being agitated.

Yolo county plans to take advantage of the farm loan bureau act at an early date.

The cash road and bridge expenditures of the United States averaged in 1915, \$109 per mile.

A free market where producers and consumers can meet for the sale of home-grown or manufactured products has been opened in Santa Rosa.

The Holland Land Co., which owns 20,000 of the 25,000 acres of land in the Netherlands district of Yolo county, will cultivate it for the first time next year, sowing mostly to beans.

The Forest Service in California

is co-operating with the University of California in the study of mill waste in the redwood belt that might be used in the manufacture of grain alcohol.

The value of property in the State of California has increased \$266,699,690 during the year 1916. One of the chief causes is the greater acreage of land assessed this year than last.

Lodi objects to being left a mile off the State Highway between that city and Stockton and has petitioned the State Highway Commission to adopt a new route for the Highway to pass through Lodi.

The State Dept. of Weights and

Measures, in an effort to stir up public interest in honest practices involving the use of weights and measures, has declared the week from Oct. 22 to 28 Weights and Measures Week.

According to the Government Crop Report issued Oct. 9 for the State of California, the condition of oranges is 93, compared with the ten-year average of 88; lemons 94, compared with the ten-year average of 88; prunes 71, compared with the five-year average of 78; almonds, 80, compared with the five-year average of 75; olives 82, compared with the five-year average of 82; walnuts 81, compared with the five-year average of 83.

26 Extra Features
73 New Conceptions

Mitchell
MID-YEAR
MODEL

20% Extra Value
Due to Factory Efficiency

\$6.62 Per 1000 Miles

Bate-Built Mitchells Have Run 200,000 Miles

Two Bate-built Mitchells have already exceeded 200,000 miles each. One has to its credit 218,734 miles. Seven have averaged 175,000 miles each.

Think of 200,000 miles. That is forty years of ordinary service. And at \$1325 a Mitchell which did that would cost \$6.62 per thousand miles.

Mr. Bate's Lifetime Car

John W. Bate has aimed in the Mitchell to give you a lifetime car. The Mid-Year Mitchell is his 17th model with this aim in view. It is the final result of 700 improvements.

Part by part he worked for perfection. To every part he has given at least 50 per cent over-strength. Castings are almost eliminated. There are 440 parts which are drop forged or steel stamped.

Chrome-Vanadium steel, costing up to 15 cents per pound, is used to meet major strains. The Bate cantilever springs are so strong that not one has ever broken.

The Mid-Year Mitchell, with its 127-inch wheel-base, weighs under 3000 pounds. It runs from 16 to 22 miles on a gallon of gasoline. Yet the high-grade materials make it the wonder-car in endurance.

20% Extra Value

A car of this grade has never before been sold at the Mitchell price. In addition, the Mitchell has 26 extra features — things which other

cars omit. We include them all in the Mitchell without extra price, though they cost us this season over \$2,000,000.

In the Mid-Year Mitchell you get a 22-coat finish. You get French-finished leather. You get 73 new conceptions, all added within a year. You get all the best new ideas which our designers found in 257 of the latest European and American models.

Compared with other cars in this class, you get, we believe, at least 20 per cent extra value. And that is all due to our factory economies, worked out here by John W. Bate.

This efficiency engineer designed all our new buildings. He equipped them with 2000 up-to-date machines. The result is a model plant, where our factory cost has been reduced one-half. That is the reason for the Mitchell extra values.

You will want these extras in your car. You will want this strength and endurance. You will want these new ideas and touches. Go and see what they mean to you, at your nearest Mitchell dealer's. If you do not know him, ask us for his name.

He will show you a list of great engineers—men of nation-wide fame—who bought the Mitchell for their personal cars. You will gladly take their judgment on the best-built car. (124)

Livestock Facts and Fancies---V.

[By the Editor.]

Last week we tried to emphasize the value which purebred individuals may have when they are the embodiment of the best animal capacity and potency. These powers are developed and concentrated by the intelligence of man, in selection of individuals for reproductive association and in selection of their progeny for their approach to or possession of the type he recognizes as indicating the phase of usefulness he desires to attain or to perpetuate in his herd or flock. To succeed in this effort a man must have wisdom and power in the selection of individuals and (as shown by the reference we made last week to the sale of the Shorthorn cow Eighth Duchess of Geneva for \$40,600) a man is sometimes justified in paying a very high price for an animal—if he knows how great a concentration of human effort and achievement there is in the particular animal, and he needs it as the foundation of his own future work. On the other hand, if the buyer does not know exactly what there is in the animal and has no definite idea of how he is to use it in his business he is likely to be robbed by a long price, and we are not sure but that he ought to be.

In a way, the real breeder, who knows what he needs and why, and the make-believe breeder, who is simply "in the game" or trying to get in, always appear to us as something like fishermen. They are both sitting on the banks of deep waters in which there are all kinds of fish. The deep waters are the fathomless depths of animal capacity for service to mankind. The fish swimming in these depths are the individual purebreds, good and poor specimens of breeds which are also good or bad—according as the catcher's purpose and design are like or unlike the purposes and designs which have ruled in the development of the different breeds. The intelligent and experienced fisherman will preen his fly, cast his line afar with light, free hand, and hook a bass surely and swiftly as the fly strikes the rippling surface. The unskilled fisherman will sheathe his hook in a worm, plunk it down in sluggish backwater and soon make fast two suckers—one on each end of the line—and both of them useless for high breeding purposes. Of course the expert angler will scout our illustration on the ground that all kinds of fish do not live in the same waters, but we must still maintain that for purposes of illustration they do. The great deep ponds of breeding enterprise do contain all kinds of fish: and, strange to say, there are sometimes sharks in the water and suckers on the bank. Stranger still, too, the sharks are sometimes amphibious and crawl out on the banks to bite the suckers. It is surely great sport: this "live stock game."

By the way, we do not like that too common expression "the live stock game." And we have been told that, as an agricultural journal, we "are not playing the livestock game right to get what there is in it." And we have to say that if it is simply a game we are out of it. Would not we look sweet at our time of

life clad in a sport-suit, with our lid angled on the rear of our bald area, straddling two posts in a paling and shooting a camera at our assistants as they make monkeys of themselves "playing the stock game right"—which seems to be a studied effort at excitement, inflation and camaraderie which shall entrap long purses for trade exploitation. It may not be particularly harmful; for it has an automatic cut-off for the exclusion of real farmers, but we do not like it because it has no real relation to great breeding purposes and the development of the State by them. Nor does it encourage farmers to seriously consider the improvement of their live stock and the systematic breeding of purebreds, for that purpose and for the legitimate trade on real values. There is a legitimate enterprise in this direction which shall raise the quality of our livestock products and make producers' lives more comfortable and prosperous. There are scores of breeders who are working intelligently and with good investment of capital to produce an ample supply of purebreds for honest and profitable producing purposes. We believe in their motives and methods. They are the men who should lead and control in this business. We have more respect for them than for the bunch of near-breeders who taunt us with "not playing the game right to get what there is in it." It is not a game: it is a serious business.

Oh well, here we are again, scolding like a fish-wife! It is probably the result of the livestock-fish metaphor in which we indulged in a preceding paragraph. And yet we see so much in the honest, genuine prevalence of purebred livestock in this State that it makes us cross to think of hollow, perverting ambitions and efforts which will advance neither man nor devil—for it will "hoist with their own petard" even those who think they see gain in it. Here we are a great commonwealth needing such development as purebred animals, which have been advancing for countless centuries toward our needs, can give us. We need more and better dairy products, and better manufacturing of the milk from better cows is the only way to get it; and such cows should be in the hands of all dairy farmers. We need more and better beef and mutton and these can only come from better feeding of animals full of the qualities and capacities of the purebred. We need more and better pork for our own use and to justify packers in embarking in great enterprises for export. In these and other lines we need multitudes of purebred animals. To get them into farmers' hands they must be really good and be sold at reasonable prices. To supply such a demand warrants farmers giving attention to understanding and breeding purebreds. To supply such a demand warrants those who have land and capital in establishing high-class breeding flocks and herds. But to justify the investment these rich men must personally know what they are at (as many other rich men have reached high under-

standing and expertness in breeding), or they must secure herdsmen who are masters of their art and not merely "cow-boys." There are young men now emerging from instruction on the University Farm, who cannot start for themselves for lack of capital, but who would manage a rich man's enterprise in breeding in an intelligent, constructive way, and if given good foundation stuff at fair prices they will bring through a purebred enterprise with great personal satisfaction and with profit to the capitalist who undertakes it aright and provides for it generously. But there is no "game" about it. It must be built on the life of a man—either that of the principal or of a wise and devoted employee who

is given interest or compensation, or both, to make him content and keen to exercise almost creative functions upon the purebred creatures placed in his charge. If the rich man thinks livestock is a "game," like the dead stock of the bucket-shop, to jump into and out of at the tip of a gamester, he had better buy a lot of cut-rate lions and start a film factory. As a "game" this would be livelier and probably more profitable.

That the swine industry of Kings county is an important factor in the agriculture of that county is shown by the fact that \$105,400 worth of hogs were recently shipped in one month to distant markets.

State Dairy Bureau's Idea of New Laws.

Speaking of the new dairy laws and the manner in which they will be enforced in so far as the State Dairy Bureau is concerned, F. W. Andreason said among other things at the California Creamery Operators' Association's convention at Ferndale, Humboldt county:

"On the first of October all of our inspectors were instructed to devote their time principally to the enforcement of the new law until they are satisfied it is being complied with. We are going to see, so far as possible, that no milk is sold at retail except from cows that have successfully passed the tuberculin test, or unless it has been pasteurized. Being that so long a time has been allowed milk producers to prepare to comply with this law, no further time should be given those who desire to pasteurize the milk instead of having the test applied to their cows. If they will not have their cows tested, and have not a pasteurizer in complete working order, we will stop them from selling milk at retail as soon as we can get to them. If a hotel or restaurant buys milk at wholesale from parties who have neither had their cows tested nor the milk pasteurized, such hotel or restaurant must pasteurize the milk before serving it to patrons. Where a milk producer intends to have his cows tested but has neglected to file application for such

test with the State Veterinarian, the inspector will, if the dairyman desires, make out the application, have him sign it, and send it by mail to the State Veterinarian. In such cases the dairymen will be allowed to sell their milk until the State Veterinarian is ready to make the test.

"It will be the aim of the dairy bureau to avoid duplicating the work of the inspectors in cities in which a proper inspection department has been established. If, however, complaint should be made that the law was being violated within the jurisdiction of such a department we should feel authorized to investigate the matter. In the smaller cities where no inspection departments have been established, we shall do all we can to enforce the law and will be glad to have the local health officers call on us when we can be of service to them.

"Many letters are received daily from people inquiring whether this new law applies to the one, two, and three-cow dairies. My reply is that it is unlawful to sell any milk, whether a pint or a glass, unless it is from tuberculin-tested cows, or has been pasteurized."

CO-OPERATIVE MARKETING OF HOGS.

[Written for Pacific Rural Press.]

What is perhaps the most successful co-operative attempt at hog marketing ever made in this State is recounted in the following communication from Wm. Way & Son of Stanislaus county.

He writes: "I handled a shipment of hogs the last week in September consisting of 87 head consigned by nine Farmers' Union members. It included 23 purebred Duroc Jersey pigs. (I call them pigs because it took such a short time to put them on the market.) They were five and one-half months old and averaged 195 pounds. We met very satisfactory results. They were sold to the Western Meat Co., sorted, and brought \$8 to \$9.52 1/2 per cwt.

"The hogs that brought \$9.52 1/2 were the 23 Durocs. These were consigned by myself and son. The Western Meat Co. offered me \$9.12 1/2 per cwt., and if they made over 77 per cent, I was to receive a premium. If they made 78 per cent, they would pay 10c per cwt. premium; 79 per cent, 20c premium, etc. After they were butchered, the Meat Co. wrote me that they made 80.8 per cent, so they paid me a premium of 40c per cwt. Another lot of 25 we received 9c for made 79 per cent, which made them net us \$9.20 per cwt. You can see by these figures that it pays to raise nothing but good hogs.

"I do not know just how the other hogs were fed, but the 23 Durocs my son and I sold were kept growing from the time they were weaned till sold.

"If we will grain-feed our hogs and finish them before we sell them, I see no reason why the buyers should not pay us the same price that is paid in the Eastern market."

Four cars of steers, 82 head in all, were shipped recently from the property of the Porterville Alfalfa Company to Los Angeles. The steers brought a good price.

HERE IS YOUR LAST CHANCE to order an IDEAL GREEN FEED SILO

and get it up in time to fill with the last crop of alfalfa, which can be fed out in time to again fill in the spring with the first cutting, which as hay is hardly worth handling, but which makes excellent silage.

YOU CAN THEN FEED SILAGE through the summer and have the silo empty in time to fill with corn next fall.

MANY DAIRYMEN TRIED THIS PLAN last year and saved enough to pay for their silo. You can do as well.

DON'T DELAY, BUT ORDER NOW.

If desired, terms can be arranged.

The Light Running Acme Feed Cutter and Silo Filler Built in Seven Sizes.

Independent Control of Blower & Cutter Head Speed.

THE ACME ALFALFA MEAL ATTACHMENT

can be fitted to all sizes of Acme Feed Cutters. This attachment will enable the making of an excellent grade of alfalfa meal from alfalfa hay at a cost not exceeding that for baling.

DAIRYING AND DAIRYMEN.

A pasteurizer has been invented for small milk dealers.

The Chico Meat Company recently paid \$40,000 for 2000 acres. It leased 2500 acres more. The company will run their stock on the newly purchased and leased winter ranges.

E. R. Eichler and F. E. Mobley, Fallon, Nev., have leased from the University of Nevada the Jersey bull Noble's Warbler, imported by the Hood Farm, Mass., and used in large herds in different parts of the country.

The Steybrae Farm of San Mateo county reports the sale of three choice Ayrshire cows to J. W. Hanna of Patterson. All three were taken from the Steybrae Farm's show herd which is now on the California fair circuit.

Following are the owners of cows in the Gridley Cow Testing Association which have produced more than 50 pounds of butterfat during the 30 days ending Sept. 30, 1916: D. Beale, Gridley, Holstein, 52.1; L. Hess, Tudor, Holstein, 50.7.

The N. H. Locke Co. report that their aged cow Empress Lass has made 11,314.4 pounds of milk and 603.17 pounds of butter in the 281 days she has been on test. She will have dropped two calves in 11 months and only milked twice a day.

M. H. Gardner of Delavan, Wis., writes that the Holstein-Friesian cow, Keystone Beauty Plum Johanna 161646, has just produced in strictly official test for 327 days 23,845.1 pounds milk containing 950.25 pounds fat, with 38 days of her test yet to run.

A. A. Jenkins of Tulare county reports the recent sale of a yearling Jersey bull to I. J. Keesling of Fresno. Mr. Jenkins is making some nice official records and expects to start several cows on test at an early date.

The Milk Products Corporation of Delaware, which has opened a casein factory in Modesto, announced a rise in price in skim milk from 15 to 20 cents a cwt. where the milk has to be transported less than three miles to the plant, and 17½ cents where the transportation is but three to five miles.

Prof. F. W. Woll has just received two \$100 sterling silver cups donated by the American Jersey Cattle Club, one for the best producing herd of 10 grade cows sired by a registered Jersey bull, the other for the best Jersey cow in the California Dairy Cow Competition.

John Burrell, owner of the Kings County Jack Farm, has recently purchased 16 jacks and 38 jennets from J. E. Dickinson of Fresno. He now has 80 head of jennets and 60 head of breeding mares weighing from 1400 to 1800 pounds on his ranch near Hanford.

At the Fresno District Fair, N. H. Locke sold his first prize two-year-old bull, Financial King of L., to Mr. C. I. Starr of Hanford. This bull has been a first place winner since a calf. Mr. Starr was greatly impressed with the young fellow and had to pay a fancy price for him. Mr. Locke is busy answering inquiries, and reports the Jersey business good.

A. A. Jenkins, a young Jersey breeder of Tulare, Cal., has sold a yearling bull to Dr. Mack of the Barstow Colony, Fresno, California. The bull is by Gertie's Lad and out of Ida Fern Smith, a granddaughter of Golden Fern's Lad. Mr. Jenkins also sold a December bull calf to C. G. Church, Loyaltown, Sierra County, Cal., sired by Gertie's Lad and Fern's Nana, the dam.

The butter situation continues bullish. The 54 Associated Cold Storage Warehouses in the Central

West and East reported on hand October 1, 77,786,000 pounds of butter against 86,468,000 pounds the same date last year, a shortage of 8,682,000 pounds. In store at Los Angeles, October 12, were 310,998 pounds of butter against 785,758 pounds at same date last year, a shortage of 474,960 pounds.

Goldie of Venadera, a Jersey owned by Guy H. Miller of Modesto, finished a yearly test on September 2, 1916. Running with the regular herd and milked only twice a day, Goldie gave 536.7 pounds of butterfat or 631 pounds of butter from 10,060 pounds of milk, an average test of 5.34 per cent for the complete year. She was bred by Mr. Miller and was sired by Marigold's Exile King, who has sired fourteen Register of Merit daughters. The dam is Margery Golden, a Register of Merit cow.

Roy M. Flicher, manager of the Post-Card Ranch of Corcoran, has just returned from Wisconsin with three carloads of Holsteins, mostly grades. This is the second shipment this year. The first arrived last April, and included many purebreds, amongst them were several daughters and granddaughters of Johanna McKinley Segis, also the three-year-old bull King Colantha Segis II, from the 29-lb. cow Grace Pontiac. They are also owners of Sarcastic Blossom Lad II, formerly owned by the University of Nevada and from their show cow and bull.

A remarkable public sale in Guernseys occurred at Langwater Farms, North Easton, Mass., Oct. 10. Seventy-five head were sold for a total of \$80,625, an average of \$1075 per head. Nineteen daughters of the great May Rose bull, Imp. King of the May 9001 A. R., averaged \$1969 apiece. The highest price of the sale, \$6150, was given for Langwater Dairymaid 26377 by C. L. A. Whitney of Albany, New York. Langwater Generous 41958, a daughter of Imp. King of the May 9001 A. R., sold for \$5000 to John S. Ames of North Easton, Mass. Three thousand dollars was paid by Branford Farms of Groton, Conn., for the yearling bull, Langwater Foremost 39191. Over 600 Guernsey admirers were present, including breeders from Maine to California.

BEEF CATTLE.

The Hollister Estate Co. of Goleta have 405 head of Shorthorns.

Forty per cent of southern territory and all of California, put under quarantine on account of Texas fever tick on July 1, 1906, were released from quarantine on this account, Sept. 15, 1916.

The sixth annual Pacific International Livestock Exposition will be held at the Union Stock Yards, North Portland, Ore., Dec. 4-9, 1916. Between \$20,000 and \$25,000 will be given in cash premiums for livestock. There will be no charge for admission and no entry fee.

The ultimate release of the Indians of the United States from dependence on Government appropriations is looked for. Cattle raising may solve the Indian problem. Indians have been found to be natural herdsmen. The Commissioner of Indian Affairs predicts that the aborigine will soon become a great factor.

SWINE AND SWINEMEN.

The Southern California Duroc Breeders' Ass'n will have noted authorities address their meetings, will encourage auctions and shows, and will have a committee to pass upon all animals for sale and exclude all unworthy ones.

In the Fillmore Agricultural Club's pig-feeding contest conducted under the direction of Farm Adviser W. B. Parker, just completed,

DAIRY CATTLE.

Holsteins.

FOR SALE—A carload of very fine registered Holstein heifers. They are sired by bulls of great producing ancestry and from dams of splendid type and large production. Some are bred to Prince Juliana Walker, a First Prize son of Prince Gelsche Walker. Several will be old enough to breed next month. Some are calves. This is a great opportunity for some one who would like to start with a small capital, as they will be priced low for a quick sale. I have an extra well-bred Kornidye bull to go with them whose granddam was a former World's Record cow. Write for full information or better some and see them at once if you are looking for a real bargain. Sold subject to tuberculin test. Geo. A. Smith, Corcoran, Cal.

REGISTERED HOLSTEIN BULL CALVES—Sired by Lorena Kornidye Alcarita, whose dam made 29.75 pounds butter fat in seven days as a four-year-old. J. M. Campbell, Bealon, Cal.

REGISTERED HOLSTEINS—Grandsons of King Segis and of world's record cow Creanella Vale. Will build up the production and value of your herd. Write or call and see them. F. H. Stenzel, San Lorenzo, Cal.

REGISTERED HOLSTEINS—Have a few bulls from El Prado Wayne Colantha, whose dams and sire's dams average per cent fat at 4 years is 5.01. See my stock at the State Fair. J. W. Benoit, Route C, Modesto, Cal.

REGISTERED HOLSTEINS—Sired by King Kornidye Hengerveld Ormsby 53822. Dam Pieterje Maid Ormsby 78051, world's record when made 35.66. Send for pedigrees. Geo. Koumas, Modesto, Cal.

TULARE GUERNSEY AND HOLSTEIN FARM is offering young bulls of both breeds. Excellent breeding. Prices reasonable. W. J. Hiedon, Tulare, Cal.

THE MCLOD RIVER LUMBER CO., McCloud, Cal.—High-class thoroughbred Holstein bulls for sale. Write for prices and pedigrees.

A SPLENDID 8-month-old Holstein bull with good A. B. O. breeding for \$135. E. W. Abbott, Milpitas, Cal.

land, Cal.

SIMON NEWMAN CO., Breeders of Reg-
istered Herefords, Newman, Cal.

GEORGE WATTERSON—Breeder registered
Herefords, Bishop, Cal.

SHORTHORNS—Carruthers Farms, May-
field, Cal.

MISCELLANEOUS.

SAN FRANCISCO LIVE-STOCK EXPORT
Co., Eugene B. Croley, Manager, solicits for-
eign orders for purebred registered and merit
breeding animals and fowls. California has
great diversity of climatic and other condi-
tions that enable us to select animals that
have been raised under conditions similar to
those of the location for which they are in-
tended. We should be informed regarding
these conditions and be allowed ample time
to make selections. Nearly all disappoint-
ments in buying afar are the result of insuf-
ficient information as to conditions or to lack
of time for proper selection. Our plan and
ours for "raising animals to order" to fit
to peculiar foreign conditions is worth in-
vestigating. References: Dun or Bradstreets,
San Francisco banks. Office 219 Under-
wood Building, 525 Market St., San Francisco.

THOROUGHBRED SCOTCH COLLIES—All
ad from our noted prize-winners. Have a
few 3 months old puppies—very choice. Write
what you want. Brownvale Kennels, Red-
wood City, Cal.

CROLEY'S CALF FEED with skim milk
it raises fine dairy heifers cheaply. Geo. H.
Coley Co., Inc., 631-637 Brannan St., San
Francisco

D. O. LIVELY, 216 Hobart Building, San
Francisco, buys and sells livestock—any kind
any quantity.

DUROCS AND GUERNSEY BULL CALVES
bred to 900-lb. boar. Ed. E. Johnson,
Rock, Cal.

Justin Snow won the contest; and
with three other boys, Newell Snow,
Walter Carter, and Frank Culp, were
given a trip to the State Boys' Club
Convention held at Davis Oct. 12 to
15.

Since returning from the State
Fair at Sacramento where its Duroc-
Jersey hogs captured ribbons in
every event in which they were en-
tered, including the Duroc Futurity,
River Bend Farm at St. Helena, Cal.,
has sold 5 sows, 2 boars and 18
weanlings. It pays to breed from
only the best of stock, and to cull
closely.

W. O. Pearson, manager of Swine-
land Farm at Woodland, advises us
that he has found the demand for
purebred Durocs and Tamworths
very satisfactory during the past
season. Among recent sales was a
Duroc boar to F. W. Marsten of
Shasta county. Mr. Pearson not
only has large herds of registered
Durocs and Tamworths but is a
large feeder of hogs as well, having
fattened 2,000 head this fall near
Williams, Colusa county. He con-
templates trying rite stubble for fat-
tening purposes as soon as rice har-
vesting is started.

SHEEP.

Our attention has been called to a
mistake in our State Fair livestock
awards by the Calla Grove Farm.
In the Hampshire sheep division
that breeding establishment won first
and second on ewe lambs and third
on range sheep ewe lambs of middle
wool type.

Jos. Levy of Calla Grove Farm,
Manteca, has just received a prize-
winning two-year-old Hampshire
ram from Indiana; also 20 head of
Hampshire ewe lambs from Utah.
He is about to ship a Guernsey cow
to Hawaii.

RESOLUTIONS ADOPTED BY THE
C. C. O. ASSOCIATION.

Following is a summary of the
resolutions adopted at the meeting
of the California Creamery Op-
erators' Association of California
at its late session at Ferndale:

1. This convention believes im-
plicitly in the pasteurization of
cream for butter-making purposes.

2. The portion of the present law
which reads: "which process shall
consist of uniformly heating the
temperature to not less than 145
degrees F., and holding at such
temperature for not less than 45
minutes," is too limited in its scope
and does not include in its applica-
tion the methods recognized by
scientists which designate proper
pasteurization for butter-making, as
the momentary heating of cream to
a temperature of not less than 165
degrees F. as well as the method
described in the existing law.

3. It is the sense of the conven-
tion that the Secretary of the State
Dairy Bureau be requested to place
this matter before the Attorney
General with a view of staying the
enforcement of this portion of the
law until such time as he can gather
full evidence covering the point in
question and render a decision.

4. The association believes that
active county associations of dairy-
men are of incalculable benefit to
the industry, and in Humboldt
county the association's members
have been afforded ample evidence of
the beneficial results obtained from
the enthusiastic work of the Hum-
boldt county dairymen's association.

5. The association pledges its
members to continued active efforts
toward the forming of county dairy
associations and pledges itself to
work with such associations for the
steady improvement and upbuilding
of California's dairy industry.

6. The association expressed its
sincere appreciation of the warm-
hearted welcome given to its mem-
bers by the citizens of Ferndale,
Arcata, and Fortuna, and thanked
the Humboldt Dairymen's Associa-
tion, the Village Club of Ferndale,
and other creameries for the un-
stinted hospitality extended to its
members and their ladies.

GOOD HOLSTEINS FOR TOYON
FARM.

[Written for Pacific Rural Press.]

With the purpose of having a
comparatively small but choice herd
of purebred Holsteins on his country
estate, Toyon Farm, near Los Altos,
Horace L. Hill Jr. has, in connection
with the Lewis Company of San
Jose, during the past summer, pur-
chased some of the best foundation
cattle available, both in the East and
in California.

Included in the lot of females are
a daughter of the 37.13-pound
three-year-old, Funderne Netherland
Fayne, a grandson of King Henger-
veld Aaggie Fayne who has eight
30-pound daughters; a 33.28-pound
aged cow, Funderne Soldene Fayne,
and two of her daughters, one with
a record of 20.75 pounds butter as a
two-year-old, sired by King Pontiac
Segis Korndyke. These and other
young cows with high records them-
selves and out of record cows and
sires make a choice foundation herd
of females. They have been bred to
a young son of King Valdessa whose
two nearest dams average over 43
pounds of butter in seven days. A
young son of Prince Gelsche Walker
out of a 25-pound dam is also in
service at the present time.

NEW BOARS AT UNIVERSITY
FARM.

Prof. J. I. Thompson, who has just
returned from a trip through the
Middle West, reports the purchase
of the Poland China boar Big Bob
Orange 2nd sired by Big Bob and
out of Grange Girl. He bought this
boar at Sievers' sale, held at Audu-
bon, Iowa. He also purchased the
Chester White boar Royal Chief,
sired by William A., a several times
grand champion, from W. T. Barr at
the National Swine Show at Omaha.
A Berkshire boar was purchased at

Iowana Farms. All three will be
put into use as herd boars at the
University Farm, Davis.

THE RIVERSIDE COUNTY FAIR.

The Riverside County Fair was
one of the most notable events of
the kind ever held in the southern
part of the State. The anticipations
of its promoters and patrons were
more than realized, and the enthus-
iasm of the participants was unabated
down to the closing number on
the program.

The feature of the Riverside Coun-
ty Fair Oct. 10 to 14 was the swine
exhibit, which was the greatest ever
shown in Southern California. The
event of importance was the organ-
ization of the Southern California
Duroc-Jersey Breeders' Ass'n to
make that section widely known for
one breed of hogs so it will pay buy-
ers to come long distances to inspect
the herds of more numerous breed-
ers. S. O. Houghton of Van Nuys
and R. K. Walker of Devore were
elected temporary chairman and sec-
retary. More members are espe-
cially desired before election of per-
manent officers at the next meeting.

At the Fair 206 hogs were shown,
including 83 Durocs, 69 Berkshires,
27 Poland Chinas, 18 Hampshires,
and 9 Chester Whites.

Dairy cattle classes were well
filled with good stock.

Rain and threatening weather—
but they had good-natured crowds.

Grand Champion Duroc boar at
Riverside County Fair was won by
the Tagus Ranch.

The Reserve Grand Champion
Duroc boar at Riverside is owned
by Peters, Lamson and Walker.

Grand Champion Duroc sow at
Riverside County Fair was won by
Peters, Lamson and Walker, defeat-
ing the P. P. I. E. reserve grand
champion.

**THAT'S
HERCULES**

It has *Hercules* materials
to begin: California oak tanned
leather, the most durable, filled
with long rye straw, threshed
with flails so as not to break
the straw—and *Hercules* skill in
the workmanship.

It has the *Hercules* reputation
behind it, two generations of
harness makers.

When a dealer offers you a *Hercules* Harness, Horse Collar
or Saddle, he is offering you **THE BEST THERE IS.**

CATTLE FEED FOR SALE

I have both wild feed and hay to be sold together,
and fed out by owner. Write me at once for prices, etc.

JAS. McCORD, Hanford, Cal.

Sheep Profitable in California.

[Written for Pacific Rural Press.]

The day was twenty-five or thirty years ago when California was one of the leading sheep States in the country. She should come to her own again in sheep production. Los Angeles is one of the greatest lamb markets in the country; and instead of sending to distant States for our lambs, we should raise them nearer home, says Louis Penwell of the San Clemente Sheep Company of California. "The sheep business of today," he adds, "offers the greatest opportunity for profit of any business in the United States. Prices are high and the demand is outstripping the supply. The shortage cannot be overcome in the next generation. The same condition has been allowed to obtain in other sheep-producing countries, due partly to the settling up of vast ranges of South America and Australia. The American sheep man has been the first to recognize that if production is to keep pace with the consumption, intensive methods must be adopted to meet these conditions. These conditions can be easily met in California, because here it is possible

to raise immense crops of alfalfa and other forage crops suitable for the feeding of sheep on a comparatively small area. One acre of irrigated alfalfa, for instance, is capable of sustaining ten sheep throughout the year.

Getting Ewes.—Small farmers are discovering that they can purchase a few old ewes cheap, and in a short time reap a good profit. An old ewe that would possibly perish on the range could be bought for \$4.00. She would produce an early lamb that would sell to the butcher for \$6 to \$7 and the same time grow \$2.50 worth of wool. In her fattened condition she would sell for \$5 to \$6, leaving a profit of at least \$9.50, as it would not cost more than \$2.00 to keep her a season.

Mr. Penwell, besides being one of the big sheep men of Montana, where his holdings are said to amount to 100,000 sheep, has recently leased San Clemente Island for twenty years. On this island there are 18,000 to 20,000 sheep, hence his views on sheep raising are those of an expert and should carry weight.

Feed and Management of Test Cows.

(Continued from first page.)

must be exercised to guard against bloat. Mid-day pasturing and full stomachs before the cattle are turned into the alfalfa are safeguards against bloat with alfalfa.

Green forage, cut fresh daily and fed in the barn or corral, is the best substitute for pasture. Alfalfa, Indian corn, sweet or grain sorghums cut in the bloom, oats, peas, clovers, or rye grass are all crops that can be profitably fed in this manner. The larger the variety of these crops, the more the cows will consume, which is the secret of securing heavy production. As much as one-half the dry matter of the ration, or up to 50 lbs. if desired, can be made up of these succulent feeds without danger to the cow or her milk flow, but smaller quantities are generally fed to test cows, as they need to have a considerable proportion of their feed in a concentrated, easily digestible form.

Silage.—Because of its succulence, palatability, and high nutritive value, silage should play an important part in the ration, if it is available. Indian corn, amber cane or orange sweet sorghum, milo maize, Egyptian corn, kaffir corn, alfalfa, and possible sudan grass are all suitable for silaging purposes. In the matter of economy, silage leads all other forms of succulent feeds, because of the labor required to cut and feed green crops, and the lessened amount of feed per acre when pasturing is practiced. When fed with all the alfalfa hay they will clean up, 25 to 30 pounds of silage daily will usually prove sufficient to cows weighing 1200 pounds or less. Heavier cows can be fed larger amounts.

The ideal situation is where both pasturing or soiling crops can be fed in connection with silage because of the variety that results. In such cases, one-half to two-thirds of the above amount of silage will be sufficient.

Roots.—This form of succulent feed is valuable, although limited in its possibilities by cost of production. Sliced sugar beets or field beets are excellent; the latter may be fed safely up to 100 pounds per cow daily if desired; sugar beets should prove as valuable for feed as the sugar factories pay, on the average. The best variety of mangel to grow is the half-sugar mangel, seed for which is procurable. Carrots may be substituted for beets if early root crops are deemed a necessity, but in most sections other succulent feeds can be obtained, which are just as efficient and less expensive.

Hay.—Alfalfa is easily the most important hay we have, also the most valuable, but too much emphasis cannot be placed on its quality. Early cut and leafy alfalfa is worth a good deal more than stemmy hay cut at a late date and cured by faulty methods. To be classed as "extra choice," alfalfa should be cut just before or when beginning to bloom, mowed in the morning, and raked into windrows in the afternoon of the same day. Cows will clean up hay made in this fashion without chopping, and there is very little loss of leaves. The Colorado Experiment Station found that 65 per cent of the leaves may be lost by the ordinary methods of hay making, this meaning that over half the cured hay is straw, which has a comparatively small nutritive value.

Although there is not the same danger in losing leaves in curing grain hay as there is with alfalfa, the most palatable oat or barley hay is that which has been cut in the milk, shocked quickly after cutting, and brought under cover as soon as possible. Grain hay is fed twice a day, the cows being allowed all they will clean up with a relish. Succulent feeds should be supplemented with a grain hay ration if possible; also it will be necessary to supply more nitrogenous and expensive mill

BASSETT'S POLAND CHINAS

GRAND CHAMPION SOW,
P. P. I. E. 1915; Sacramento 1916.

For many years, at widely separated show rings, under many different judges of varying type ideals, my Poland Chinas have been consistent prize-winners. My herd is large, and I cull closely. The animals sent out as breeders are the very tops of a large number. I KNOW that my kind of Poland China is a profitable farmer's hog, for I send carloads of them to the packer every year—uniform in size, high in quality, quickly and economically matured and finished.
Young Stock, \$30 Up.
M. BASSETT,
Bx. 1, Hanford, Cal.

Elmer Lamb Closing Out Durocs

AT PRIVATE SALE.

Owing to continued ill health I am obliged to take a year's rest and will sell all my herd of registered Durocs at prices little above the market for common hogs. Everything goes, including State and World's Fair Champions. 25 bred gilts and tried sows, 30 gilts ready to breed for next spring litters. Sows with litters, and weaned pigs, Service Boars, etc. Get my price on what you want. This is your chance and my sacrifice.

ELMER LAMB,

Ceres, Cal.

BERKSHIRES

When the Butte City Ranch Berkshire herd was started, there was a definite object in view.

This was to establish one of the outstanding herds of the breed—to do constructive breeding—to produce hogs of the greatest possible usefulness, and of outstanding merit.

This herd was not started to last for a day or a month or a year, but we expect Berkshires to be bred on Butte City Ranch as long as there is a livestock industry in California.

In establishing the herd, we selected foundation animals from the best sires and dams in the best herds in the State. This gave us the benefit of a wide selection.

We have a definite type in mind—and that is the most profitable hog the California farmer can raise. Everything has been selected to conform to this ideal. Not only do the animals we have selected conform to this type, but their ancestors have for generations. No great herd has ever been built without the practice of rigid selection.

By selecting our foundation animals from the best produced by the best breeders, we started with the very cream of the breed.

A Big Importation

We have recently added to our herd an importation from the East of 54 sows and 2 boars from Iowa Farms at Davenport, Iowa, and W. S. Corsa's Gregory Farm herd at Whitehall, Ill., two of the best herds of the Berkshire breed. These conform to the Butte City type and are an outstanding lot of hogs. Included among them is the boar, Iowa Champion Peer 2nd, who cost us \$750 there.

We are now in position to supply the best foundation stock—one or a carload. We have bred sows, bred gilts, open gilts, weanling pigs and boars.

Five Boars in Service

We have five great boars in service. Iowa Champion Peer 2nd is a big type boar of much quality. He was sired by Rivals Champion, a boar that cost Iowa Farms \$1750 when 5 years old. Rivals Champion is also the sire of Prof. Curtiss' great sire, Rivals Champion Best, and of the great boar recently imported to Hopland Stock Farm. We consider Iowa Champion Peer 2nd a bargain at \$750. Mayhews Leader 6th is sired by A. B. Humphreys' boar, Grand Leader 2nd, the grand champion of the world. He is rated by many as the best son of the champion and has proven an impressive sire. Then we have a son of the University Farm boar, Star Leader, a son of Superior, a litter brother to Grand Leader, and Baron Duke 104th, a Gentry bred boar out of a daughter of the great Lord Premier.

Our customers must be satisfied. We are in the business for a lifetime. Every animal sold carries our guarantee—which we will absolutely stand back of.

Prices from \$30 Up.

Everything Cholera Immune.

feeds or oil meal and not the cheaper, more starchy mill feeds when grain hay is fed, instead of alfalfa hay.

Grain and Mill Feeds.—Variety in the grain ration is as important as with succulent feeds, for it insures a keen appetite and maximum milk production all the time. Feed prices should, of course, be considered before computing the most economical ration, but in California rolled barley, whole or rolled oats, bran, middlings, dried beet pulp, dried or wet brewers' grains, oil meals, linseed meal, cocoanut meal, and soy bean meal are the most important and desirable grain feeds. Rice bran or middlings are desirable components of grain mixtures if pure, containing only a small amount of rice hulls.

Where alfalfa hay is fed, the object in computing the grain ration should be to furnish the largest possible amount of carbohydrates in digestible form at the least cost; and with present prices the following rations may be considered in the order given:

1. Dried beet pulp, 3 parts; rolled barley, 1 part; or cocoanut meal, 1 part, instead of barley.

2. Rolled barley, 1 part; dried beet pulp, 2 parts; cocoanut meal, 1 part.

3. Rolled barley, 1 part; wheat bran, 1 part; dried beet pulp or molasses beet pulp, 2 parts; cocoanut meal, 1 part.

Cocoanut meal should be limited on account of its laxative qualities; and both barley and bran should be carefully considered on account of present high prices.

Cows will naturally vary in the quantity of feeds they can consume, but in general one pound of either the above rations to each five pounds of milk a cow gives will be sufficient.

For cows producing very high-testing milk, and for heifers, one pound of grain to every four pounds of milk is desirable. This is also needed in all cases where a poor quality of roughage is being fed.

Besides one of the above rations, liberal amounts of the best alfalfa hay and succulent feeds should be used.

When grain hay is the basic roughage, the object in computing the grain ration should be to furnish a maximum amount of protein and easily digestible nutrients with a minimum of bulk. Two rations which will economically serve this purpose at present feed prices are:

1. Rolled or ground barley, 2 parts; wheat bran, 2 parts; dried beet pulp, 2 parts; linseed meal, 1 part.

2. Rolled or ground barley, 1 part; cocoanut meal, 1 part; dried beet pulp, 2 parts; linseed meal, 1 part.

It is understood that pasture, green soiling crops and silage will add to the above rations when fed either singly or as a group, also that the same amount of grain be fed as when alfalfa hay is used.

An abundance of fresh water in clean troughs should be available at all times and salt should be available for the cows to help themselves.

Must Be Breeding Stock.—A point all contestants should bear in mind is the rule which makes it compulsory for all cows to be in calf five months after freshening. Further, a purebred sire at the head of the

Insure your feed supply against early frost and rain with

REMCO SILOS

The early cessation of the rains last spring and their unusually early opening this fall should be a warning to all feeders of livestock, especially dairymen, to no longer neglect the addition of silos to their equipment.

It is not yet too late to order a Remco silo to save your crop of corn from the frosts likely to follow the early rains, or to save your last cutting of alfalfa.

A Remco silo is your cheapest insurance against all such losses. Send in your order early and avoid delay.

Redwood Manufacturers' Co.

SACRAMENTO VALLEY DAIRYMEN TO MEET.

[Written for Pacific Rural Press.]

Encouraged by the success of the dairy marketing associations which have been in operation in San Francisco and Los Angeles during the past year, leading dairymen in the Sacramento valley have called an organization meeting at Sacramento, October 25.

Jas. M. Henderson, chairman of a committee of milk producers recently appointed by the Sacramento Valley Development Association, outlines the purposes of the association as follows:

"To furnish facilities and agencies through which such bona fide milk producers as desire to become members shall market their milk, cream, butter, cheese and other dairy products upon a uniform plan and in such a manner as to bring about a better standard of quality, a more uniform distribution and a larger consumption thereof in the cities, towns and communities in the valley and in such other places as the association may desire to serve; to encourage its members, to facilitate production, to standardize and develop their product for the market and to find the readiest and most available market for their product."

A swine show in connection with the fifth annual meeting of the California State Swine Breeders' Ass'n, which will be held at Los Angeles some time during January, was being agitated at Hanford last week. The delegation present from Los Angeles promised the support of the Los Angeles Chamber of Commerce and breeders were favorably impressed with the idea.

Raising Poultry for Profit

THE FARM EGG—THE CAUSE OF THE LOSS.

[Written for Pacific Rural Press by Susan Swaysgood, Pomona.]

At this time of the year when there are many broody hens the nests require great care if the eggs are to reach the consumer in a wholesome condition. One reason why farm eggs are not paid for at the highest market price, is because buyers have to run too big a risk on the quality. Now this does not mean that farmers, as a whole, are careless in the matter, but that some are, and we all have to pay the price. When broody hens stay on the nests all day to be thrown off at night when eggs are collected, they are breeding lice and mites, and if an egg is broken maybe a little of it is left on the boards or the litter; it

dries, perhaps, but at any rate it leaves a bad odor and is a harbor for mites, ants, and nobody knows how many kinds of vermin, that leave their impress on the porous egg shell. What happens after, I leave to the imagination. But this much is certain, that if the farmer is ever to come into his own he must live up to the law of right, which is the "golden rule." The U. S. Department of Agriculture gives some very interesting figures showing the loss to three buyers of farm eggs in Kansas during the months of July, August and September.

The total figures are 706,569 dozen of eggs bought. Out of these candling proved that there were 553,599 firsts; 73,011, seconds; 13,510 checks; 66,449 rots.

Now I made a mistake in saying these buyers lost that much in eggs. When anybody tells you that, don't believe them; it is not true. The farmers of the Sunflower State lost that much in eggs during those three months, because the buyers bought those eggs on a safe basis, allowing for the loss they realized would come at candling time.

QUERIES AND REPLIES.

[Answered by Susan Swaysgood, Pomona.]

Bowel Hardened.—Killed a young rooster, and found a hard gristle substance from liver to stomach. Looked like a bowel, but was a hard, green substance inside. It appeared to be in perfect health. Chickens run in orchard and have a clover patch.—Mrs. W. B. C.

No; there was no disease. The gristle came from something the bird had eaten at some time. The liver tried to remove the obstruction by sending a flow of bile to the point and that colored the substance. Eventually it would have gotten rid of it and you would never have known that such an interesting thing had happened.

Heads Scabby.—My chickens have dark scabs on the heads; some have one and some several on the eyes or around them. They seem to have a good appetite. My neighbor calls it chicken pox.—Mrs. B.

Your neighbor is correct. Clean up all the rubbish around your yards, and if you have not too many chickens to handle each one separately, you can soon get rid of it. The main thing is to clean up and feed the chickens well to keep up their strength. Rub every chicken's head well over with carbolated vaseline; put ten drops of tincture of iron per quart of water and make them drink that instead of clear water. Vaseline the heads once a week and it will soon disappear. If you have too many to handle each one separately, get a can of Kreso Dip No. 1, mix according to directions, and spray the chickens on the roosts at night, not being particular whether you hit the head or feathers, because they will get the stuff on their heads themselves. Vaccination is also claimed to be a cure.

Pigeons Have Mucus in Mouths.—Have a flock of pigeons that are affected with canker or roup. They have difficulty in breathing, and yellow mucus gathers on nose, throat, and sometimes on the eyes.

Can you tell me how to distinguish between the two diseases? Am also troubled with mice eating the young squabs when a few days old. Please give me a good disinfectant for around the barn; one that will not injure the value of the manure.—Ignoramus.

Roup and canker are but different forms of one trouble, or to make it plainer, different symptoms. In patches on the throat it is called canker, or when it is on the bill, inside the mouth or on the tongue. In the eyes, nostrils, etc., it is just plain roup or catarrhal colds. When it gets in the throat it requires something strong. Pound up some bluestone very fine. Dip a feather in the fine bluestone and put it on the white patches in the throat. Give a little iron in the drinking water, and feed them well. They are probably a little low in vitality owing to the molt or they would not have got that trouble. See that they have no lice and spray your nests and runs with Kreso Dip No. 1, making the liquid quite white—the whiter it is the stronger. Directions for use come with it. Use it freely in all cases where there is roup or any poultry disease. The very best and surest remedy for mice is a good trap.

SOUTHERN CALIFORNIA FEDERATION NEWS.

[Written for Pacific Rural Press by Susan Swaysgood, Pomona.]

On Sept. 28 the Federation of Poultrymen met in Los Angeles to find out how the members felt about making a change in the grade and to see if they wanted to co-operate with the State through Col. Weinstock. The members were nearly unanimous in regard to the last proposition, but held some discussion about the grade. However, it was decided to make new grades to conform to those of San Francisco in size, weight, and color.

So long as Los Angeles had to import eggs, the grading was not of so great importance, but with the increase of production that has been going on the last year it is felt that Southern California instead of importing eggs will go into the exporting business, even in car-lots back to New York City.

In 1914 there were imported into Los Angeles 158 cases of eggs; in 1915, 53 cases; in 1916 only 27 cases; and it is quite certain that we could have gotten along without them.

It is estimated that we have an increase of 65 per cent in laying hens; and the members of the Federation alone turned into Kline, Simpson & Co. 16,000 cases of eggs in six months. Members of the Federation comprise not more than 35 or 40 per cent of the egg producers of Los Angeles county. A great many chickens are kept in the city of Los Angeles, and these eggs reach the consumer in many ways without going through the ordinary channels of trade, so that it is a little difficult to get at exact figures, but it is certain that Petaluma will have to look to her laurels. We have not so cheap feed here as the Petalumans; neither have we so cheap transportation; but we have just as earnest, vigorous men behind the poultry industry, that are willing to devote time and means to help each other and especially

NESTS AND NEST EGGS.

[Written for Pacific Rural Press by Susan Swainsgood, Pomona.]

The nest should never be built near the dropping boards, but on the opposite side of the house. No matter how convenient they are made, if they are around or under the dropping boards there will come a time when the mites will follow the hen scent and perhaps just when you are very busy with other work the mighty mites will kill a few chickens for you before you find out what is the matter.

Have your nests put on the airy side of the house with either bottom or top opening all along the line so that you can spray and clean out when necessary.

Nest eggs made from chemicals and guaranteed to keep mites and lice away are a deception; they flavor the eggs, as they are composed very largely of naphthaline and coal oil, and they give a sense of security that is unfounded, because the mites go there anyway. It takes something more than odor to drive mites; it takes something to touch them. All nesting material should be taken out and burned once in two weeks at least. As all hens like to scratch around a little before laying it often happens that the litter is scratched out and the egg dropped on the bare boards, breaking the end that falls, which is always the small end.

To avoid that is sometimes hard on account of the build of the nests, but if your nests are built in rows that open from the bottom it is a good plan to spray the bottom with white distillate and carbolic acid, then tack a layer of gunny sack all along the nest bottom before putting in place. This saves breakages and the hens cannot scratch it out. The very best spray—and where it is not possible to spray it can be applied with a paint brush—is white distillate and pure carbolic crystals will make it strong enough to kill mites and other vermin, and it gives a clean wholesome smell to the nests. Never use crude oil near nests or eggs.

The very best nest material I know of is clean grain straw. Alfalfa hay is next, but if it gets wet, it discolors the eggs. Sawdust is not bad, but I don't like sawdust, because hens will pick it up some times and it may kill them. In the last they have a litter called O. K. litter that is good for nests and can be used as a scratch litter. From the good accounts of it it would pay some of our dealers to investigate and place it on the California market.

POULTRY NOTES.

Six poultry-fattening stations will be established in New Brunswick, Canada, before the beginning of the winter. The provincial government

intends to form poultry clubs in every county and to award prizes for the best dozen chickens fattened, killed and boxed for export.

The Escondido Valley has developed into quite a poultry country. One firm alone is shipping from there to the Los Angeles market \$500 worth of eggs per day.

The Pebbleside Hatchery of Sunnyside, Santa Clara Co., sold no less than 200,000 baby chicks last season and have doubled their incubator capacity for the coming season.

Reports from Imperial Valley say the turkey crop this year will be about the same as last. In the East there is said to be more turkeys than last year; but times are good there, hence a strong demand is felt.

The storage supply of eggs continues to grow beautifully less each month, hence the continued bullishness of the market. The 54 associated cold storage warehouses in the Central West and East reported on hand October 1, 2,871,000 cases of eggs, against 3,689,000 cases on same date last year. In Los Angeles, October 12, there were in cold storage 41,409 cases of eggs, against 38,439 cases at same date last year, an excess of 2,970 cases.

ARTIFICIAL EGGS.

Dr. Alois Wale of Craz, an Austrian chemist, has perfected a process for making synthetic or artificial eggs in the form of a coarse yellow powder. It is claimed that it is so similar in taste and smell to genuine egg powder that it is exceedingly difficult to detect the substitute. It is made from the albumen contained in the blood of slaughtered animals. Dr. Wale has named his product Haematalb, under which term it is already extensively used in the hospitals of Austria and Germany. It dissolves in water and has proven satisfactory in the preparation of pastry and other forms of food.

The owner of a large rice-milling company of Hawaii, who has just returned from an inspection tour of the rice fields and mills of California, Texas and Louisiana, says that Hawaiian rice cannot compete with American. "In California they are making big profits out of rice while the Chinese growers in Hawaii are playing a losing game."

Mrs. Best's Letter.

My Dear Friends: I have seen some of the prettiest dress hats this week, made of combinations of lace or net and velvet or fur. One of them was very much of a sailor shape, with the brim of black net and the edge having a band of fur of the same color as the small crown of panne velvet. This suggested opportunities to work over a summer hat of net by adding a velvet crown or a fur trimming. Of course, these hats would not be suitable for wear in very bad weather, but on clear days they are very good indeed.

One of the other models was a mushroom shape, narrow, drooping brim made of a silver lace, without facing, so that the effect was light and dainty and the crown was of blue velvet shirred in a modified tam-o-shanter. Another model of the same shape was a combination of gold lace and pink velvet. This style of hat is trimmed very simply, just a rose or a little ornament of some kind and if fur is used, it is narrow and not heavy looking.

The furry beavers are with us again in soft colors as well as black and blue and they are trimmed almost like little girls' hats, a ribbon of metal color, loosely placed around the crown and a flat bow a little to one side of the front. They are soft and droop in graceful lines and are very generally becoming.

If you have a black velvet sailor with a soft crown that you want to

THE HOME CIRCLE

change a bit, put a circular fold of black maline around the edge, letting it project a good inch—then with a narrow band of fur around the crown finished with a rose, you will have a much newer effect.

All the hats this year are worn well down on the head, making them seem more like a part of the individual than when perched high and to most people they are becoming. In some cases, a little loosening of the hair around the face is necessary to get the best results.

I think it would be impossible to have a season without seeing the three-cornered or colonial hats. This year they are irregular in shape, one of the points being longer than the others. These are shown in soft colorings as well as in light biscuit color tops with black velvet facing and for a general utility hat they are really more satisfactory than the larger hat.

As the season progresses, I see more hats that the brim has an upward tendency, and some of the new silk beavers have quite a pronounced roll to the brim and have fur trimming, something in a stiff feather or breast. Ostrich plumes are not much seen, although clusters of small tips and narrow ostrich bands are used on some hats.

There really is a very wide range of styles, so that it is quite possible to freshen up an old last winter's hat and feel quite well dressed in it.
Rosabella Best.

PICKLED ONIONS.

Pour hot salt water over small, white onions that have been previously peeled with a silver knife. Let them lay in this brine for two days, then drain onions and boil enough vinegar to cover them. Throw onions into the boiling vinegar and boil 5 minutes. Take from the fire and lay onions in glass jars, with alternate layers of whole white pepper, a few whole cloves, and five or six mustard seeds. When jars are filled, re-heat the vinegar, add 1 cup of sugar to each gallon, pour over the onions and seal while hot.

PRICKLY PEARS.

Editor Home Circle: In reply to inquiry of E. J. F. as to the use of prickly pears or cactus fruit, would say that I make a syrup of white sugar, as for figs, to which I add the pears after they have been peeled, and let them come to a boil slowly. Let simmer until rich and thick and clear looking, possibly all day long, and I think it makes an excellent preserve.—Mrs. S. A. B., Carpenteria.

Turnovers.—Meat turnovers furnish a good way for using up cold meat. The meat should have all gristle removed, and if more quantity is desired, add bread crumbs and highly seasoned tomato sauce to the well-chopped and seasoned meat. Roll the pastry thin, cut in rounds and place meat on half the round, after wetting the edges well, fold over the other half and pinch firmly together. Fry in hot fat or bake in a quick oven.

Floral Department.

[By Geo. N. Tyler.]

If you have not sown the seeds of the following, do so at once, as described in a former article: Sweet peas, pansies, coreopsis lanceolata, shirley poppies, stocks (gilly flower) and in fact most of the hardy annuals, biennials and perennials.

If you have a cold frame or small greenhouse you can put in the cuttings of achyranthes, that showy border plant. Put the cuttings in boxes of sandy soil (three inches of soil is enough) one inch apart and three inches between rows. The tips make the best cuttings. They must be protected from frost. Lift a few plants of lobelia and put them in boxes, so you can protect them from frost, and in the spring you can put in the cuttings from them and by planting-out time have fine plants for bedding or borders. The above plants and cuttings should be put away in a sheltered, shady place and after the first thorough watering, do not give any more until growth starts, which will be in about three weeks. Spray the plants every day in bright weather.

You can still put in cuttings of pelargoniums and zonal geraniums and they will make fine plants for spring. You can put in most any kind of cutting at this time and they will root very easily.

Carnations root very easily now. Make the cuttings from shoots on the flowering stalk. Do not take them too high up on the stalk or too low down; they must be soft wood. Put in sand and keep shaded and free from draught. They will root in about four weeks.

Take hard wood from lavender and also plumbago. Make the cuttings six or eight inches long, put them in four inches deep and most every one will root.

If you have not dug up your gladioli bulbs, do so at once. After they are dug put them away in a shady place for a week or two so they will dry off, then put them in the sun for a day or two to ripen. Then they can be cleaned and put in paper bags down cellar or up in the attic for the winter. But be sure and label each variety so they will not be mixed in the spring when you plant them out.

Continue planting all kinds of bulbs as fast as you can procure them. A great many pot plants are troubled with worms in the soil. An easy way to get rid of them is to make lime water, by putting any kind of lime in water. The water will only take up a certain amount of lime. Put the water in a bucket or tub and set the pots in it so the water will stand over the tops of the pots. This not only makes the worms come to the surface but also sweetens the soil.

BRAN BREAD.

One cup sour milk, 1 teaspoon each of soda and salt, ½ cup molasses, 1 cup whole wheat flour, 2 cups Ralston's bran, ½ cup raisins, ½ cup walnuts. Bake in a slow oven one hour.

BAKED GINGERBREAD WITH APPLES.

Cut five large apples in eighths, remove skin and seeds. Cook until about half done in a thin syrup made of one-half cup sugar and one-fourth cup boiling water. Drain apples from syrup, put in buttered baking dish and pour over a gingerbread mixture. Bake in a moderate oven. Serve with whipped cream, sweetened and flavored with vanilla.

SHOWERS FOR BRIDES-TO-BE.

In entertaining for prospective brides, novelty is much sought after and one of the new ways to entertain is to have a "Pantry Shelf" shower. The gifts must consist of jams, jellies and the like and in addition to being unique, provides a nice little gift for the new home.

10-rib Durability

Defies Wear-scuff and Wringer strain.

THE closer the weave the longer the wear. If you wish, you can prove in advance the durability of Mayo 10-rib underwear. This way:

See Mayo 10-rib Underwear. Note its closer weave. Count the 10 ribs per inch.

Then stretch a Mayo garment in your hands. Notice the "give." Such elasticity! It is this same elasticity which makes Mayo Underwear hug your body with its snug, true fit.

Feel that fleeced inner surface too. That's what puts June warmth into winter months.

Look out for dropping thermometers. Your Mayo 10-rib Underwear should be in a bureau drawer waiting now for the first cold day.

Men's Single Garments. Men's Union Suits. Boys Union Suits

Those who prefer the old style 8-rib garments will find Mayo 8-rib underwear an excellent value.

Mayo

The Same 10-Rib knitting that's found in dollar Underwear.

All dealers have Mayo Underwear or can very quickly get it for you.

THE MAYO MILLS, MAYODAN, N. C.

Good Health.

(By H. E. Pastor, M. D.)

The "A B C" of Bathing.

"Know ye not that ye are the temple of God, and that the Spirit of God dwelleth in you. If any man defile this temple, him shall God destroy." Which shows, that the idea of personal cleanliness (moral as well as physical) is primitive and as old as the race itself.

The human body is in process of building up and breaking down during every moment of its existence from its first feeble cry to its last expiring breath. Food, drink and fresh air furnish the building-up elements, and the eliminating organs of the body rid the system of its broken-down products. One of the most important of these excretory organs is the skin, which brings to the body's surface much waste matter in solution, the moisture passing off in insensible evaporation mainly, leaving a deposit of offensive matter on the body's surface, which, while it may elude the sense of sight, rarely escapes the sense of smell. The bath is employed primarily to remove this odoriferous and pore-clogging deposit, and no self-respecting person who regards his own comfort and the comfort of his intimates will neglect this sanitary habit. Don't strain the politeness of friends to the breaking point. The bath is a good deodorizer, and better than attar of roses as a sweetener. Take it early in the morning, and cold, if you are strong; in the evening before going to bed, and tepid, if you are debilitated or tired. Ten or eleven o'clock in the morning is, however, the best time of the day, and if you are a lord or lady of leisure you cannot devote this hour to a more sacred use. The cold sponge bath is the safest—using preferably, salt water, with or without soap, and it should be of short duration, followed by a brisk rub with a coarse towel. A cleansing tub bath, with soap and hot water, should be taken once a week, just before retiring; and this should be religiously followed the next morning with the customary cold sponge bath to harden the skin and remove susceptibility to catching cold. Some refinements of this highly healthful practice will be touched on in a future issue.

HEALTH BRIEFS.

No one is too poor to keep clean.

Health is an asset never sufficiently esteemed—until lost.

A careless spitter should be swatted like the careless fly.

Don't wait till tomorrow to reform an unhealthful practice; tomorrow never arrives.

If you value your eyes, don't be too lavish in patronizing the picture show. It cares more for your money than your eyesight.

Ill-health is Nature's punishment for some infraction of natural law, consciously or unconsciously committed. She's slow to act, but you can't elude her.

Cultivate habits of health. The right habit makes the job easy, and leads to longevity; the wrong habit is a short-cut to the cemetery over yonder on the hill.

"Young man, the best tonic for you is the right kind of food. I suggest for Breakfast

Ghirardelli's Ground Chocolate

STANDARD OIL COMPANY
(California)

SAN FRANCISCO.

San Francisco, Oct. 18, 1916.

Wheat.

Buying for export has been very heavy in the East, and advances there are reflected in the northern market, with slight advances locally on some grades.

[First-hand prices on strictly first-class grain, San Francisco.]
 Sonora wheat \$2.20@2.25
 Northern club 2.20@2.25
 Cal. club, cti. 2.20@2.25
 Northern Bluestem 2.50@2.55
 Northern Red 2.30@2.50

Barley.

Spot barley remains very firm, with an active jobbing demand and more or less inquiry for export and Eastern shipment. No further advance is noted, however.

Shipping, cti. \$1.80@1.85
 Choice feed, cti. 1.75@1.80

Oats.

Red and black seed oats are rather scarce, and red are quoted at a rather sharp advance. White are slightly easier, and feed oats remain steady as before. Prices quoted on seed are for re-cleaned stock, from dealers. Feed prices are for first-hand offerings, San Francisco.

Red feed \$1.80@1.85
 Red seed 2.15@2.20
 White 1.70@1.75
 Black seed 3.00@3.25
 Texas Red seed 2.40@2.50

Corn.

Most of the Egyptian offered so far is in poor shape, according to local dealers, and they are rather slow in taking hold of it, though prices are pretty firmly held in the country.

[First-hand prices on strictly first-class grain, San Francisco.]
 Eastern Yellow, cti. \$2.10@2.15
 Milo Maize Nominal
 Egyptian, new 1.80@1.85

Beans.

The bean market is still spasmodic and unsettled, with crop conditions imperfectly known. While reports from some sections indicate slight damage, others are very discouraging, and dealers state that almost the entire crop in some lines will show damage. They are accordingly unwilling to buy except on very close inspection, and growers are holding off a little in anticipation of an advancing market. The shortage has already brought some sharp advances, the only decline being on pinks. One interest has been paying \$8 for small whites threshed before the rain, but these are now believed to be all cleaned up, as well as old-crop stock. It will probably be several weeks before the market gets down to a definite basis. The Michigan crop is reported as being good and prices there are \$5 per bushel, or \$8.30 per hundred.

[First-hand prices, on wharf, San Francisco.]

Bayos, per cti. \$4.75@5.00
 Blackeyes 4.25@4.40
 Cranberry beans 5.00@5.20
 Horse beans 3.25@3.50
 Small Whites (south) new crop 7.50
 Large Whites, new crop 7.00@7.25
 Pinks 5.25@5.50
 Limas (south) 5.40@5.50
 Red Kidney 6.50
 Mexican Reds 4.90@5.00
 Tepary beans 4.25@4.50

Soybeans.

Alfalfa is declining, with larger offerings. Quotations are for re-cleaned or guaranteed seed, free from dodger, etc.; average prices to growers about 5c less, depending on quality and location. Melilotus alba is very scarce and high.

[Wholesale prices, S. F.]
 Alfalfa, per lb (guaranteed) \$1.18@1.19 c
 Oregan Vetch 4.45@5 c
 Melilotus Indica 7 1/2 c
 Melilotus Alba 23 c
 Bur clover, re-cleaned 12 1/2 c

Hay.

Arrivals have decreased sharply, probably owing to the rain, but with light local demand little is being drawn from warehouses. There is little export business, and country business is reported quite active, but the city demand is very slack. Green feed is coming up rapidly in the country, and will avoid the necessity of feeding a great deal of hay. Straw is in strong demand and, higher.

[Wholesale prices per ton, carload lots, San Francisco.]

Wheat, No. 1 \$13.00@14.50
 No. 2 10.00@12.00
 Tame oats 11.50@15.50
 Wild oats 10.50@13.00
 Barley 10.50@13.00
 Alfalfa 10.00@14.50
 Stock hay 8.50@9.50
 Straw, per bale 45@65

Feedstuffs.

[Wholesale prices per ton, carload lots, San Francisco.]
 Beet pulp, per ton Nominal

THE MARKET REPORTS

Figures Given Are Independent and Reliable.
 Prices Quoted as Paid to Producers.

Alfalfa meal, per ton \$18.00@19.00
 Bran, per ton 26.00@27.00
 Oil Cake Nominal
 Coconut cake or meal 23.00@25.00
 Cracked corn 44.00@45.00
 Middlings 35.00@38.00

Cheese.

Monterey cheese is slightly higher, in sympathy with the recent advance in flats. The latter, as well as Y.A.'s, remain steady as last quoted.

[S. F. Dairy Exchange prices.]

Y. A.'s, fancy 18 c
 Fancy Calif. Flats, per lb 16 1/2 c
 Monterey Cheese 16 1/2 c

Deciduous Fruits.

After a week of poor and damaged offerings, local supplies are again showing attractive quality and the movement is improving. Strawberries are an exception, and prices are still low. Apples stand steady as before, with a great deal of stock being stored by first-hand holders. Bartlett pears are firmer, all stock coming from storage, and winter nells are somewhat of a factor in the market. Figs are much lower, with liberal offerings, largely off-grade. Cantaloupes have been in oversupply, poor stock, no demand, prices are hardly quotable. Most lines of grapes are lower, though firmer for several days past.

[Wholesale prices, San Francisco.]

Huckleberries, lb., fancy 8@10c
 off grade 6@8c
 Strawberries, chest \$3.50@5.00

Dried Fruits.

The general market continues in very healthy condition, as far as demand is concerned, with an active movement into consumption in the larger markets, as well as a good deal of export business on several vessels now leaving for Europe. Apples are rapidly being absorbed, and evaporators are getting as high as 7c for the best stock. The expectations of growers as to 15-cent apricots have also been fulfilled, though there are now very few with anything to sell at this price. Black figs have moved up another notch, with heavy loss reported to the white varieties not dried before the rain; output will be extremely short. The shortage of small prunes has forced the price up to 6 1/2c, and 6c is now offered for large sizes, with holdings in the country becoming rather scarce. The Association has advanced the price of peaches from 1/2 to 3/4c on all grades. The Raisin Company announces 100 per cent delivery on contracts for London layers and fancy clusters, other grades being short as formerly reported. [Net to growers, bulk basis, f. o. b. shipping point.]

Apples, new crop 6 1/2 @ 7 c
 Apricots, per lb. 1916 14 1/2 c
 Figs, white, 1916 None offered
 Figs, blk 5 @ 5 1/2 c

 Prunes, 4-size basis, '16 6 @ 6 1/2 c
 Pears 6 1/2 @ 7 c
 Peaches: Standard yellow 6 c
 Muirs 6 1/2 c

Almonds.

The Almond Exchange stock is now practically all sold out, and almonds are moving in a jobbing way at an advance of about 2c.

Groceries.

Two more jumps have taken place in sugar, which is now held at a \$7.45 basis, and flour is up to \$7.80 and \$8.20 per bbl. Compound lard is up 1c per lb. Condensed milk is up 10c per case, and canned meats are also higher. Advance of 2c per gal. reported in salad oil, matches are expected to advance Nov. 1.

Horses.

Local market dull and featureless.

Special Livestock Market Report.

San Francisco, Oct. 18, 1916.

There is no quotable change in any of last week's prices, though cattle are getting scarcer in California and the supply from over the mountains does not equal the demand. Prices tend to rise. Hogs are still of grain-fed quality, stubble stock being continued on grain. Sheep movements equal the demand. There is no movement in wool except a few small lots being bought in the country at about prices quoted.

[Prices paid for stock, live weight, off cars, without feed or water, at Stock Yards, South S. F.]

LOS ANGELES.

Los Angeles, Oct. 17, 1916.

Butter.

Receipts California by rail for week ending Tuesday, October 17:
 1916 260,800 lbs.
 1915 285,100 lbs.

The high prices of last week checked consumption and with weaker markets east, extras sold down Saturday 1c to 33c, at which price the market has ruled steady since. This is 7c higher than a year ago. Receipts are a little lighter this year than last, to which with a marked shortage in the cold storage stock, must be ascribed this advance, rather than any increase in the demand.

 1915 26 26 26 26 26 26

Eggs.

Receipts by rail as reported to the Produce Exchange for week ending Tuesday, October 17:

1916 1012 cases
 1915 835 cases

There was a further upward movement in this market the past week. Receipts were light and the street demand held up very well, taking the current receipts. Cold storage stocks here only fair, while in the Central West and East they are over 800,000 cases short of last year. Hence the market has been getting no assistance from that quarter, compelling trade to depend upon nearby production and causing buyers to bid up well to get what they want. Railroad receipts for the week 1012 cases and estimated by truck 700 cases, total 1712 cases against 1595 cases by rail and truck same week last year. Wednesday under better receipts and weaker markets East, prices broke 2c, fresh ranch case count selling at 48c.

Fresh ranch case count 48c
 Pullets 40c

Special Deciduous Market Report.

[By J. L. Nagle.]

Sacramento, Oct. 16, 1916.

All markets on both Malagas and Tokays are unusually high, and in fact the demand exceeds the supply everywhere. Though considerable damage was done by the recent rains to the first crop, the quality of the second crop, which is unusually fine, has to a large extent offset the damage.

Drum and keg packing of Emperors is in full swing and practically 85 per cent of the output has been sold in advance, at prices that will average net to the grower in excess of \$30.00 a ton.

The following prices have ruled for the week:

New York.—Tokay grapes averaged \$1.62; Malaga, \$1.21; Muscat, \$1.35; Clairgeau pears, \$2.48.

Chicago.—Tokay grapes, \$1.76; Malaga, \$1.35; Cornichon, \$1.54; Persimmons, \$1.52.

Boston.—Tokay grapes averaged \$1.75; Malaga, \$1.47; Cornichon, \$1.97; Muscat, \$1.47.

Total shipments to Oct. 16, 14,763 cars; total shipments same date 1915, 13,449 cars.

Poultry.

Receipts continue light and altogether local. No eastern poultry coming in. Broilers in good demand and higher and so are fryers. Young roosters bringing more money. Hens, ducks, turkeys and geese unchanged and all in fair demand. We quote from growers:

Broilers, 1½ to 2 lbs.24@25c
Fryers, 2½ to 3 lbs.20@22c
Hens, over 4 lbs.19@20c
Hens under 4 lbs.15@16c
Ducks14@15c
Geese13c
Roosters, 3 lbs. up (soft bones) 20c
Turkeys, heavy, 12 lbs. and up..21@22c
Turkeys, light16@19c
Squabs, live, per doz.\$1.50@3.00
Dressed3.75@4.85

Hay.

There is no change to note in this market from a week ago. It continues very dull. All kinds are being neglected. Receipts the past week were

not heavy, yet at the same time were more than enough for the demand. Each day saw more or less hay carried over unsold. Receipts past week 150 cars. We quote f. o. b. Los Angeles:

Barley hay\$14.00@16.00
Oat16.00@18.00
Alfalfa, Northern13.00@14.00
Alfalfa, local15.00@16.00
Straw7.00@7.50

Walnuts.

The movement of walnuts to market is still light owing to unsettled weather. Some few are coming in and demand good and market firm at quotations.

The associated prices this year and last are:

No. 1	1916	1915
No. 2	\$15.50	\$13.50
Budded	12.50	10.50
Jumbos	19.00	17.00
Jumbos	17.50	16.50

Orchard run 3c per pound less.

Special Citrus Market Report.

Los Angeles, Oct. 17, 1916. Shipments of oranges from Southern California from Nov. 1, 1915, to Oct. 15, 1916, 31,031 cars oranges and 6,777 cars lemons; against 32,802 cars oranges and 6,683 cars lemons same time last year.

Shipments from Central California from November 1, 1915, to October 15, 1916, 5,402 cars of oranges and 150 cars of lemons, against 5,650 cars of oranges and 207 cars of lemons same time last year. Light supplies and the lateness of the season caused a higher market at the East the past week, and demand very good both for oranges and lemons. The falling off in the receipts of other fruit and larger demand for them also helped the market and caused buyers to take hold more willingly. Locally the market keeps dull. Only old stock on hand. No new oranges in yet. Desirable sizes in fair demand, but all others very dull. Lemons much neglected.

New York, Oct. 16.—Sixteen cars of Valencia and three cars of lemons sold. Oranges and lemons about 25c higher. Weather partly cloudy. Valencia averaged \$3.20 to \$6.45; lemons averaged \$2.90 to \$5.30.

Boston, Oct. 16.—Seven cars sold. Market stronger and higher on both oranges and lemons. Valencia averaged \$3.30 to \$5.20; lemons averaged \$5.10 to \$5.60.

Philadelphia, Oct. 16.—Four cars sold. Market strong and higher. Valencia averaged \$2.30 to \$4.95; lemons \$3.65 to \$4.65; grapefruit \$3.65 to \$4.30.

San Francisco, Oct. 13.—Nine cars Valencia, one car mixed and one car of lemons sold. Valencia fully 25c higher. Lemons also 25 per cent. higher. Weather cloudy. Valencia averaged \$3.25 to \$5.45; grapefruit, halves \$1.00 to \$2.35; lemons \$4.40.

Boston, Oct. 13.—Four cars sold. Market is doing better. Valencia averaged \$4.00 to \$5.05.

WANTED TO RENT an orchard on shares by experienced orchard Superintendent. Box 270, this office.

seventy-seven years young and expect to be able to read your journal for the next 25 years. Wishing the old Press a long and prosperous life." The Pacific Rural Press celebrated its 45th anniversary last January.

Raise more corn. About a year ago we printed an article describing the 600-acre field of corn raised on the Brack tract, northeast of Stockton, which the writer had personally inspected. The crop grown last year was experimental, but the returns were so satisfactory that 1000 acres were grown on the same ranch this year and the yield is estimated as being heavier than last season. With corn yielding better than 50 bushels per acre, and selling for \$2 per hundred, the owners of that ranch need worry little over the question of profits. If that ranch were stocked with purebred beef and hogs, the combination of corn, beef and pork would be ideal and the profits proportionately greater. Farmers who have proper soil and climatic conditions in California should raise more corn.

LEAKY ROOFS

can be made raintight by using **LEAK-NOT COATING**. Will do the work on any roof. Comes in 3 colors—Black, Olive Green, and Dark Red. Black covers 125 sq. ft. per gallon. Green and Red 25% more surface.

Every gallon of LEAK-NOT guaranteed. Why gamble?

The New Reo the Fifth, "The Incomparable Four," \$875, f. o. b. Lansing

Here's the Secret of Reo Reliability

DOUBTLESS YOU'VE WONDERED—knowing as you do, how absolutely dependable are Reo cars—how free from troubles, and how low in upkeep cost: YOU'VE WONDERED wherein lay the secret of that reliability that is Reo.

WELL, WE'LL TELL YOU. And then you'll wonder at its ridiculous simplicity.

YOU READ, IN THE ADS, how this engineer or that inventor has revolutionized the science of engineering and produced a wonder-working car.

YOU READ THAT every year—only this year it's another engineer. That revolutionary stunt of last year has been forgotten.

IT WAS AS IMPOTENT as a South American revolution—it didn't!

SO THE SECRET ISN'T to be found in any such feat or invention.

REO PERFORMANCE—reliability, dependability, uniformity of performance of all Reos, of whatever model or price—is the result of the taking of infinite pains in the designing, the making and the inspection of the Reo product.

IT'S THE LITTLE THINGS that count—not the big ones.

ANYONE—A BOY EVEN—can make a motor that will be "different." Or an axle, a transmission or a set of springs that might impress the tyro as new and wonderful.

BUT TO MAKE ANY of these vital units better—that is the task—that should be the aim. It has always been the Reo aim.

INFINITE CARE in the fabrication and then in the inspection, and finally in the testing of the assembled whole—that is the secret of Reo success in making, not the most but the best, automobiles.

IF THERE ARE 2000 PARTS in a motor car; and if there's an average of four machining operations on a part—that's 8000 chances for something to go wrong!

AND ONE DEFECTIVE PART—one, however small or seemingly insignificant—that does not fit absolutely, and you'd have a car that would be less than a Reo in performance—more than a Reo in cost of upkeep.
